Reports :—

First Interim Report [Cd. 6515].

Second Interim Report [Cd. 7210].

Third Interim Report [Cd. 7505].

PRELIMINARY NOTE.

The Commissioners present in the Union of South Africa were :—

Sir EDGAR VINCENT (*Chairman*),
Sir ALFRED BATEMAN, K.C.M.G.,
Sir HENRY RIDER HAGGARD,
TOM GARNETT, Esq.,
WILLIAM LORIMER, Esq., LL.D.,
JOSEPH TATLOW, Esq.,
} representing the United Kingdom.

DONALD CAMPBELL, Esq., LL.B., representing Australia.
JOHN ROBERT SINCLAIR, Esq., ,, New Zealand.
Sir JAN WILLEM STUCKERIS LANGERMAN, representing the Union of South Africa.
The Hon. EDGAR RENNIE BOWRING, representing Newfoundland.

Evidence was taken by the Commission—

At the Provincial Council Chamber, Cape Town, on February 25th, 26th, 27th, March 2nd, 3rd, 4th, 5th, and 6th.
At the Chamber of Commerce, Oudtshoorn (Cape Province), on March 11th.
At the Town Hall, Port Elizabeth (Cape Province), on March 13th.
At the Town Hall, East London (Cape Province), on March 16th.
At the Town Hall, Kimberley (Cape Province), on March 18th and 19th.
At the Raad Zaal, Bloemfontein (Orange Free State), on March 20th and 21st.
At the City Hall, Durban (Natal), on March 23rd, 24th, and 25th.
At the Provincial Council Buildings, Pietermaritzburg (Natal), on March 27th, and on March 28th at Nel's Rust Farm, near Pietermaritzburg.
At the Provincial Council Buildings, Pretoria (Transvaal), on March 30th, 31st, and April 1st.
At the New Law Courts, Johannesburg (Transvaal), on April 2nd, 3rd, 4th and 6th.

Evidence was also taken by Committees of the Commission at Newcastle (Natal) on March 23rd, and at Johannesburg on April 2nd, 3rd, and 4th.

The evidence has not been printed in chronological order, as it dealt with a large variety of subjects, but is presented under the following main heads :—

I. Migration, Land Settlement, and Irrigation.
II. Communications.
III. Empire Development.
IV. Natural Resources.
V. Mining and Mining Conditions.
VI. Trade.
VII. Legislation.

In several cases individual witnesses dealt with different subjects under one or more of these heads. In such cases the evidence has either been divided, or, where that course was impossible, printed under the subject to which the greatest attention was devoted.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

DOMINIONS ROYAL COMMISSION

IN THE UNION OF SOUTH AFRICA IN 1914.

PART I.

I.—MIGRATION, LAND SETTLEMENT, AND IRRIGATION.

CAPE OF GOOD HOPE.

Cape Town, Friday, 27th February 1914.

Mr. Francis Edgar Kanthack, A.M.Inst.C.E., Director of Irrigation for the Union of South Africa, called and examined.

1. **(Chairman.)** I understand you are Director of Irrigation for the Union of South Africa?—Yes.

2. Your sphere is the whole territory of the Union?—Yes.

3. Would you, then, please make a statement as to irrigation?—Yes. The general policy of the Government as regards irrigation is not so much to undertake large State schemes, but rather to foster private enterprise and co-operative enterprise. At the present time it must be realised that our policy is the best, considering the conditions here. We have a very small population in relation to the size of the country, and market conditions are abnormal. We have no home market at all, and it takes very little to glut such market as we have. Unless produce is produced which can be exported, the people cannot get rid of it. At present I think there can be no question that this country, as a whole, must be considered mainly as a pastoral one, and its future, I think, largely lies in that direction, so that irrigation is to a very large extent an adjunct to stock farming, and in that sense we are only at the fringe of our development. Vast areas of the country are being stocked, at present, on the basis of a condition of drought. Large areas will only carry one sheep to about ten acres, whereas with a very little extension of irrigation on the farms by means of small dams or boreholes it is possible to grow fodder, lucerne, or winter feed, and immediately double the stock-carrying capacity of the farms. Then, again, it must be remembered that, owing to the peculiar geological conditions, we have comparatively little soil in the country which is alluvial. Most of the country is composed of very ancient formations—thin soil with narrow ribbons of intensely rich alluvial valleys; but they form a very small proportion of the entire area of the country. Naturally, all these valleys have attracted the best people, and they will always form areas on which closer settlement can be encouraged. Then, again, it must also be remembered that, unfortunately, the greater part of South Africa was practically partitioned among a comparatively few white people in days gone by, and the only land which is left in the hands of the Government is either unhealthy country or desert like the Kalahari, Bushman Land, and parts like that, where from an irrigation point of view nothing could be done. There is no water to irrigate with, and as far as development of underground supplies is concerned, experiments so far made go to show that it is both precarious and sometimes bad in quality.

4. **(Sir Rider Haggard.)** Brackish, like Australia?—It varies greatly. It varies from district to district, but there are some parts of the country where the underground water is very bad, suitable for neither man nor beast.

5. Does it kill vegetation?—Yes; vegetation is, of course, more sensitive than animal life. As far as irrigation is concerned we are, therefore, generally confined to these comparatively small parts in the alluvial valleys, the whole of which land is already parcelled out, and to purchase that land is a very costly matter. The land which is capable of being put under irrigation where there are any possibilities at all, mostly in the Cape Province, is now selling at from 5*l.* to 10*l.* a morgen—this is an all-round price for a farm, and includes veld as well as arable land—and then it must be remembered that it will generally take anything from 20*l.* to 50*l.* a morgen to place it under irrigation. People do not like spending money on unimproved land which will require a very large amount of capital to develop. The Cape Province, I may mention, is much ahead of the other Provinces as regards irrigation. To begin with, the country is more arid, and, in many cases, in order to make a living at all, the people have been forced to irrigate, and it has made them generally more enterprising. The result has been that, although the early efforts in co-operation and irrigation were slow, and one had a lot of disappointment to meet, the position at present in the Cape is that in practically every district where it is possible to use water for irrigation the people are now only too eager to combine and avail themselves of its benefits, and to make use of our legislation to carry out these schemes. The great point about co-operative enterprise is that this comparatively small number of people who come under the scheme are financially fully liable for the cost. They can get nothing from the Government by political pressure, and the result is that every co-operative scheme that has been started in this country so far has been an unqualified success. They are all doing well. Every man has to work hard, and they are doing it; whereas every State scheme that has been launched in the past has been a comparative failure. They have been exploited politically, they have had the wrong kind of people, and without exception they are non-paying propositions, and a comparatively poor class of people is living on them. Under the co-operative scheme the country is surveyed by the Irrigation Department. We discover the

schemes and work them up, and the projects are laid before the people interested. These people, in course of time, form themselves into an irrigation district, and they elect their own board. This board, under the Irrigation Act, has the privilege of borrowing money, generally from the Government, but also from outside sources, if they so desire it, at a very cheap rate of interest on the security of the irrigation rates which these boards are empowered to levy.

6. What rate of interest?—They only pay 3¾ per cent. on the money. It is borrowed under a sinking fund system, the period of which rarely exceeds 40 years. The ordinary maximum period is 30 years, and the average rate which these people have to pay for interest and redemption is generally in the neighbourhood of 5 per cent., that is, 3¾ per cent. interest on the borrowed money, and the balance redeems the loan in 30 years. Apart from these co-operative schemes we are also doing all we can to assist private individuals in schemes of their own, and likewise lending them money on mortgage at the same rate of interest, 3¾ plus redemption, on periods of anything up to 30 years; and these loans are taken full advantage of. On the whole we have at the present moment approximately one million of money outstanding, and we have only had one defaulter, to the extent of about 150*l*., which I think is highly satisfactory.

Besides the Government reconnaissance surveys, we have a well-organised hydrographic survey. The department also assists any private farmer or irrigation board which may require our services or professional advice on any scheme, and this work is done at very low fees. The Government only charge them 1*l*. a day, and these benefits are taken very full advantage of. Farmers have learned that it is better for them to use the department in connection with their irrigation works than go on haphazard as before; and although we have been much criticised for interfering with private enterprise, it is not really a sphere in which the private practitioner can do much good. The ordinary private practitioner cannot afford to run about the country attending to these little jobs except at fees that no farmer would be prepared to pay. He would rather muddle along and do without the engineer altogether. As a matter of fact, the activity of the Irrigation Department has probably done more to create work for private engineers than anything else, because, although we advise on schemes, we do not construct them for private individuals or irrigation boards. They must, therefore, turn to the private engineers for their assistance in this direction, though the work may be constructed under the supervision of the Government. Apart from these works, the Government do not, of course, leave out the State scheme altogether. In certain instances the Government is practically forced to construct large works on their own account. But, so far, we have kept such schemes within comparatively small dimensions in order to form a number of nuclei in different parts of the country, which will act as centres from which irrigation will spread. At the same time, we have now embarked upon a new era since Union, and a number of very much more ambitious schemes are under consideration, which, in the days of separate Colonial Governments, were practically impossible. Quite a number of what, for this country, must be considered very large schemes will be undertaken within the next few years.

Now, apart from irrigation in its ordinary sense, the Government carries out a very large amount of boring for underground water, and there are two separate spheres of that work. In the first place, it has now been accepted more or less as a hard and fast policy that no arid and waterless land shall be given out for settlement on which water has not been found by boring, and after having found water these areas are cut up into suitable farms and given out under the Land Settlement Act. On this work we are at the present time spending approximately 50,000*l*. to 60,000*l*. a year. Apart from that, we are also spending an equally large amount on hiring drills to private individuals in certain parts of the country at rates which amount to 4*l*. a day per drill for boring for water on private land. We have at present something like 80 drills in the field—large drills of the heaviest size—and the equipment generally is probably the most modern in existence, and the work has undoubtedly done an enormous lot of development in these dry tracts. In the Cape Province, where the geological formation is comparatively simple and the rock is soft, it is an easy process and water is easily found. But as one proceeds north into the older formations, drilling becomes a more difficult and costly matter, and on the whole our average cost for the Transvaal and Bechuanaland and Kenhardt works out at about 11*s*. a foot. In the soft Karoo strata drilling does not cost more than about 4*s*. or 5*s*. a foot. That is including casing, where necessary, but the farmers hiring the drill provide fuel and water.

7. What inch pipe?—All our holes are drilled 6½ inches diameter.

8. **(Sir Alfred Bateman.)** That is cheap, is it not?—Yes.

9. In London it costs about 1*l*. a foot?—Well, even our very hardest formations in Bushman Land do not cost 1*l*. a foot. I do not know whether the Commission wishes to know what the functions of the department are.

10. **(Chairman.)** No, that does not concern us.—Well, I think that gives a bird's-eye view of the position.

11. **(Mr. Sinclair.)** Does the existing system of irrigation deal with the arid and poor land as well as the rich fringes of which you have spoken?—Yes, where possible, but it is generally only possible to irrigate these rich fringes, because they are the only places where we have the necessary combination of soil and water.

12. I wanted to get from you what is expected from the irrigation systems? You are going to irrigate the rich fringes; is it possible to do anything with the inferior lands that surround them?—Only as grazing.

13. I am not speaking merely of the physical possibility, but what would be the economic possibilities? Can results be looked for?—Only from a grazing point of view, speaking generally. There are cases in the north Free State and the Transvaal where the land away from the rivers, though naturally poorer than the alluvial soil, is still able to give a good return if placed under irrigation. But, generally speaking, in the Karroo system, which covers about 50 per cent. of the Union, the soil is very very thin and does not justify the cost of irrigation works.

14. Can you give us an idea of the proportions of land that can be treated by irrigation?—I do not think we have enough information to give a definite percentage, but I should say roughly, from what I know of the country, that it would not be more than 5 per cent. of the entire area.

15. And you told us that you regarded the country as mainly a pastoral country?—Yes.

16. Are you speaking of the whole Union?—Yes. Of course, country like the Western Province is naturally excluded, but these comparatively rich areas form, after all, a very small proportion of the whole. If you take the entire plateau, it is essentially a pastoral country, and its future lies, I think, in scientific stock-farming.

17. What I was trying to lead up to was this—to find out to what extent irrigation will encourage small agricultural farming in the Union?—Well, irrigation is essential to small stock-farming over the greater portion of the Union, because otherwise it is impossible for any individual to live on a small piece of land at all.

18. Are there still, to any considerable extent, areas of land available for small farming that can be dealt with by irrigation?—Is it Crown land that you are speaking of?

19. Unsold State land.—Well, of Crown land there is very little which is suitable for that class of settlement.

20. Does not it follow, then, that there is not now available in the hands of the Crown areas of land suitable for small farming in the Union?—No, generally speaking, there is very little of it.

21. That is to say, the land suitable for farming, large or small, is in the hands of private individuals?—Yes.

22. And they are the persons who will benefit by systems of irrigation?—Yes.

23. So that if the areas that so benefit are cut up into smaller areas for incoming farmers, the incoming farmer will have to pay to the present holder the increased price?—That is so.

24. Does not it follow from that, then, that there is no available land moderately priced for the incoming small farmer?—Suitable for irrigating, I take it?

25. Suitable for agricultural working, which you tell us cannot be carried on without irrigation?—I should say, broadly speaking, there is no land in the hands of the Crown which is suitable for the small holder—for incoming settlers.

26. It follows from that, does it not, that if the existing farms are cut up into smaller areas the buyers will have to pay a substantial price for it?—Yes.

27. You told us that no lands are sold by the Crown without first experimenting by boring has been carried out?—Yes, that is the waterless tracts.

28. What is the class of land to which you now refer when you tell us that?—It includes some of the best grazing land we have in the Union.

29. You are speaking, then, of grazing land?—Yes.

30. And in such areas where boring has shown that there is water, what extent of land would be required for a settler before he could make it pay for pastoral purposes?—Well, it varies enormously according to situation. In the Northern Transvaal they have come down to farms as small as 600 to 800 acres, whereas in Bechuanaland they run to many thousands of acres.

31. Would that be used for sheep-farming?—Well, generally on these areas the sheep come in later on. Most of this country in the Northern Transvaal and Bechuanaland is not suitable for sheep at first, it requires to be "tamed" so to speak, the grass is too rank. Later on, when it has been heavily stocked with cattle, sheep will do all right.

32. And the areas you mention—say 800 acres?—That is the smallest in the Transvaal. In Bechuanaland it would be about 6,000 acres for a standard size of farm. And if we went further west still—we have just been opening portions of the Kalahari, for instance, where it would be impossible to satisfy a man with a farm of less than 20,000 acres.

33. You have given us the extremes?—Yes.

34. Can you give us an idea of the capital required by an incoming farmer to deal with 800 acres, say, in the Transvaal?—I think that is a question you had better put to the Secretary for Lands.

35. You prefer not to express any opinion as to the capital required in the other cases you gave us?—Well, I could only really speak from first-hand knowledge of the more highly developed irrigated portions of the Union; for instance, in the Cape Midlands.

36. Can you give us any assistance as to the amount of capital required by the incoming farmer to deal with the pastoral lands?—Well, I would rather not. It would be guesswork.

37. Then what in your opinion is the direction in which the settlement of land can, with best prospects of profit, be carried out within the Union?—Through the breaking up of the large holdings in the irrigable areas. I will give you an example. Take the Great Fish River in the Cape Midlands. We have now got formed, or at the point of being formed, a long series of irrigation districts which will bring under irrigation approximately 70,000 acres of the very richest land we have in the country. The whole of that area is held by a comparatively few men. There are a number of districts where there are rateable areas of about 800 to 1,000 acres in a single holding, and the average holding in every case is about 500 or 600 acres of irrigated land. Now, that is a great deal more than these people can manage.

38. You are now speaking of agricultural land?—Yes. Now, throughout those areas many of these owners are face to face with the alternative of having to find settlers or purchasers for the greater portion of their holdings, or to get into serious financial difficulties. They have ten times more land under these schemes than they can possibly develop themselves.

39. But I suppose they want substantial prices for their land?—No, from what I have seen, in most cases they are quite ready to sell at a price which is perfectly reasonable as a commercial investment.

40. What do you regard as the value of such lands?—The value of that class of land, I should say, is from 5*l.* to 10*l.* a morgen. That is 2*l.* 10*s.* an acre for both arable and grazing land.

41. That is for the land itself?—Yes.

42. And you think there are large areas of land at present in private hands which will be available for similar smaller settlement at about those prices?—Yes, and are changing hands at the present moment for that purpose.

43. Are they getting into the hands of new settlers, or into the hands of people who are already in the country?—I should say practically all getting into the hands of people in the country.

44. Is the demand for such land on the part of those already in the country, having regard to the areas available, sufficient to absorb all that is available? Well, I do not think that has been proved at all. The people that are taking up land of this kind are largely composed of men from the Transvaal, coming down from the mining centres like Johannesburg, or from the towns, men like retired Civil Servants and others who are trying to get on to the land, but they are not, generally speaking, drawn from the agricultural section of the population.

45. Then do you think that you have of your own people—I do not care in what occupation they may be at present engaged—in your own people, sufficient to take up any land that will be available?—At the present moment, yes.

46. In other words, what I want to get at is what room is there for outside settlement? I mean for people coming into the country?—There is room for the immigrant if he is capable, has capital, and has a certain amount of experience. There is undoubtedly room.

47. Then you think those who are here are not sufficient in number to absorb the whole of the available areas?—No, I do not think so.

48. Although you do not care to express any opinion as to the capital required in the case of pastoral lands, it is obvious, is it not, that the system will require that all those undertaking to break up pastoral lands will need to have substantial capital?—Yes, certainly.

49. Is there anything else that you can tell us which will throw light on the question I am trying to pursue—the availability of land for pastoral or agricultural use by small holders from outside?—Provided they are of the right class and have agricultural experience, people of that class could probably get land immediately.

50. But there is no room for the man without either experience or capital?—Quite so.

51. **(Sir Rider Haggard.)** With regard to this irrigation—how is it done—by dams, chiefly?—Far and away the greater part is done by what is known as flood irrigation—that is to say, when the rivers come down in flood two or three or more times a year. The works are constructed and laid out in such a way as to distribute the flood water over the entire land by means of furrows.

52. Not by holding up water and turning it on?—No. Unfortunately, we are worse off in this country for good storage sites than almost any other country in the world.

53. You mean an area over which, when the stream is flooded, you can shoot water and let it sink away perhaps once, twice or more times a year?—Yes.

54. On such lands what do they chiefly grow—lucerne?—Yes, that is the staple crop under irrigation in this country.

55. Will a couple of irrigations or waterings do for that?—Yes. Lucerne is peculiarly adapted to this system. It has deep roots and I do not know of any crop which will stand such an abuse in the way of not getting water as lucerne. It can go without water for eighteen months sometimes.

56. What depth does it grow—40 feet?—I have seen roots growing 20 feet deep. In the States examples are quoted 200 feet deep.

57. You can grow fruit, I suppose?—Yes.

58. Oranges?—Yes.

59. A couple of waterings would do for them?—Yes.

60. Mealies?—Mealies very rarely pay under irrigation.

61. Wheat?—It is irrigated in certain parts of the Union under a very peculiar system—under the basin system, something like the old system on the Nile. But it is unique here and confined to particular areas in the districts of Calvinia and Kenhardt and Fraserburg, where one flood—and that one can generally expect four years out of five—is sufficient to procure an outturn of at least fifty-fold.

62. How many bushels?—They sow about half-a-bushel to an acre and get back anything—fifty to a hundred-fold. They get anything from 20 to 40 bushels.

63. That land would have to be manured, I take it?—No, because it manures itself. They let the flood into these large basins and the water stands in them for a considerable time and deposits about half-an-inch of the rich mud every year.

64. Is there much of that land?—More land than there is water for. Irrigation development has been retarded because farmers have never been able to get the produce to market. Government is now building a railway to that area.

65. Where is the area?—Along the Zak River and tributaries in the districts of Calvinia and Fraserburg chiefly.

66. What is the value of that land?—It has gone up very much of late. Three or four years ago that land could be bought at half-a-crown an acre—now it is selling at about 10*s*.

67. Is it a very remote part?—Yes. As soon as they finish the railway, of course, conditions will change. I have seen farmers burn stacks of chaff and throw milk away because they could not get rid of it.

68. Every sort of crop can be grown under this system of flooding?—Yes.

69. And from dams?—Yes.

70. Dam works are very expensive?—Yes, but these flood irrigation works, on the average, very seldom cost more than from £10 to £15 a morgen irrigated.

71. You put a wall across and turn the water on when there is a flood?—Yes, it involves diversion of the water by a weir into furrow. Reservoir irrigation can very seldom be effected under 25*l*. a morgen. It varies from 25*l*. to 40*l*.

72. What is the total area of land which you have irrigated in the Union and which is capable of it?—An attempt was made to get at it in the last census, but I am afraid I cannot subscribe to those figures.

73. Do you think them too big or too small?—In some cases too low and in others too high.

74. Can you let us have an estimate of your own?—I will try to do so.* It is almost impossible. I was very keen on using the census in 1911 and made every effort to get the information, but, judging from the returns from districts I know personally, these figures are very inaccurate.

75. I take it that there is a large irrigable area?—Yes.

76. What do you reckon, in an ordinary way, is a sufficient bit of land for a family to live on?—For land settlement purposes in the Union in Government settlements we have taken 10 morgen of irrigable land as the lower limit. I am very much averse to any smaller piece of land being given to any individual in this country.

77. Perhaps you think 30 morgen would be better?—No, that is too high.

78. Twenty?—It varies according to the quality of the soil, but I should say 10 morgen is the lower limit and 25 the upper.

79. That is to say for a man with a small capital?—Yes.

80. What capital would a man with 20 morgen want?—That is, if he gets it in the raw state?

81. He has to build his house, of course?—Before he has finished he would want one thousand pounds. He must have with that area of irrigated land some grazing land also.

82. How much?—I generally like to allow 5 to 10 morgen for every morgen of irrigable land.

83. He would want altogether, say, 500 acres of land?—Yes.

84. You talked of those Kalahari farms where you say people want 20,000 morgen—I suppose they are quite waterless?—Yes.

85. No prospect of irrigation there?—No.

86. Or subterranean water?—No, not for irrigation; all that can be done is to get sufficient water for stock.

87. And poisonous water at that, I suppose?—It all depends; we have struck some good water.

88. What is the rainfall there?—I suppose under 3 inches.

89. It is a desert, in fact?—Yes.

90. Are you satisfied with the progress of irrigation?—Yes. In the Cape I am satisfied. In the Transvaal we have not been at it as long as in the Cape, and I think, considering that the whole organisation is new, progress, on the whole, has been satisfactory.

91. Do you think those lands will be bought up as quickly as you can make them irrigable?—Yes.

92. But always by people in the country?—No, there are limits to that on this high-class land. You cannot put poor whites on to high-class irrigation plots.

93. Will not they irrigate them?—They have not got the knowledge, or the energy, or the capital.

94. You think the thing is going well?—Yes.

95. On what terms may a person buy?—Do you mean Crown land?

96. Yes.—I would like you to ask the Secretary for Lands that question.

97. **(Sir Jan Langerman.)** You gave me the impression, at all events, that only 5 per cent. of agricultural land and 95 per cent. pastoral land was the proportion in the Union?—Yes, more or less.

98. Surely that would be incorrect. Do you only refer to irrigated land?—No, first-class land on which crops can be grown with certainty.

99. Surely there is a lot of agricultural land in this country where crops are grown without irrigation?—Yes, that is included in the 5 per cent. I mean 5 per cent. in all.

100. The Western Province here and the high veldt of the Transvaal?—Yes.

101. Where mealies can be grown without irrigation?—Yes.

102. And the whole of the Free State, where you can grow mealies without irrigation?—I do not admit you can.

103. The whole of the coast belt in Natal, where you can grow coffee and sugar, and the greater part of the alluvial Transvaal where cotton can be grown?—Yes, and even then I do not think there is 5 per cent. which you can really class as land on which you can rely on a crop. There is, I am perfectly certain, a lot of land with a precarious rainfall on which you can get crops occasionally, but I do not class that as good arable land.

104. Do you call our mealie production a catch crop?—No.

105. No mealies are grown in the Union under irrigation?—I know that, but the south of the Free State and the whole of the western portion of that Province is unsuitable for growing mealies, and for the last three years no mealies have been grown there.

106. Nor wheat on the Basutoland border?—I referred only to the southern and western portion of the Free State—that is quite unfit for dry land crops. All Gordonia and Griqualand is unfit. When put into square miles that area is enormous. It comprises the bulk of the Union.

107. Have you any information as regards the quantity of water that you have raised through boring?—I can supply that.*

* *See* Appendix VI., p. 53.

* *See* Appendix VI., p. 53.

108. How many millions of gallons have you raised?—I think we could get that. You mean from the very beginning?

109. Yes.—I think we could give it.*

110. Can you also give us information in regard to the increase of cultivable land through boring in the Union?—I can give the Crown land areas on which we have bored during the last two years. The system we adopt is as follows. The land is valued at prairie value, which is nominal, because until the borehole is there nobody can live on it. When the borehole is put down and the yield of water is known, the Land Boards revalue the farms. We keep a sort of profit and loss account for this work. We do not charge any individual farmer with the entire cost of the boring. Boring on a particular farm may cost a great deal more money than Government can get for it. In another case drilling costs very little, and the value rises enormously owing to the water found. On the whole we are coming out on the right side. I make up my balance sheet for each year. If I put in an annual statement I think it will show the Commission to what extent the Land Boards consider land in these dry tracts is being enhanced in value by boring operations.*

111. According to your statement land is only enhanced by the cost of boring?—Yes.

112. If you are a business man and buy a piece of land at, say, half-a-crown a morgen, and then bore for water at your own expense, would you sell that land at half-a-crown plus the cost of boring?—No.

113. What is the increase in the value of land through boring and finding water?—You are increasing land in most cases from no value at all to an exceedingly high value—a farm for which you may have to pay a very low price, in the first instance, say, sixpence or one-and-sixpence a morgen, suddenly becomes worth 10 shillings a morgen when you have a borehole on it yielding a good water supply.

114. Now what is your information about boring? Is it the general rule that you can find water? What is the proportion of land where you do not find water?—There are very few cases where we have had absolute failure.

115. Where there is no surface water the chances are that if you bore you increase the value of that land?—Yes.

116. Therefore, however dry the country may be, and however little surface water, there is always a chance of settlement the moment you bore?—Yes.

117. There is, therefore, great scope for settlement?—Yes. You immediately turn that piece of land into a good stock farm.

118. When you speak of 800-morgen holdings, where do you refer to?—I believe most of the farms in the Rustenburg and Waterberg districts are 400-morgen farms.

119. Those are the old lands which the old Transvaal Government cut up?—Yes.

120. But the usual farms in the Free State and Transvaal are 3,000-morgen farms?—Yes. I gave those 400-morgen farms as the smallest Government farms, and I know many of these have been given out. Of course, up there the value is very great as soon as the water is there.

121. Gordonia is the only place, more or less, where you do not find water? Where is the place where you put in a whole series of boreholes and did not find water?—In one part of Gordonia we bored and found nothing but poisonous water—Epsom salts. I drilled deeper, and thought we might case the bad water out, but the water got worse. In certain other parts, where we struck water near the surface, we cased it out and found sweet water lower down.

122. Is that salty water of any value?—No, not the water referred to above.

123. What is the average depth at which you found water?—The average depth, I should say, is in the neighbourhood of 200 feet. We have a number of holes 600 and 700 feet.

124. And you get sufficient water for farming purposes?—Yes.

125. **(Mr. Garnett.)** What flow of water would be necessary to turn 3,000 morgen of land into a stock farm?—On a farm like that, unless we found 3,000 gallons of water a day, we would not consider that we had found water. It depends on the number of stock which is kept.

126. But what do you consider sufficient?—I should say on a 3,000-morgen farm 2,000 gallons a day. There is one drawback about storage schemes as the want of silt in the water necessitates fertilising the ground.

127. Have you any difficulty about getting skilled experts?—The trouble here is not only to get the engineer, but you have to train him to local conditions. We find that the raw man from oversea has to be here for two or three years before he knows anything. It applies to the farming immigrant also.

128. I suppose your drills are fully occupied?—Yes.

129. How, in your opinion, does the future of irrigation compare with the future of dry farming?—Well, I think the case for dry farming has been over-stated. There are parts which are eminently suited for dry farming, but great parts of the country are not so suited, where it is impossible to rely on a dry crop except once in ten years. I know parts of the Karroo which are said to be fit for dry farming where the rainfall is unseasonable, very irregular, and the soil in many places only 12 inches deep or even less, and where the relative humidity is extremely low, and the unfortunate people who have attempted to dry-farm there have met with failure. Even in the United States, where so much of it is done, there are States where one can farm with 12 inches of rain, and in others you cannot farm with 20 inches. You cannot go by the average rainfall alone, in this country it is no guide. All the rain may fall in two or three storms, and, on the other hand, it may fall in little showers which are useless.

130. **(Sir Jan Langerman.)** I conclude that, in your opinion, irrigation is of more importance?—Yes, I think dry farming must be confined to the Transvaal and the Eastern Free State.

131. **(Mr. Bowring.)** Is there any tendency for the volume of water to decrease in your boreholes?—No. The shallow holes show decreases. Our experience with the modern holes is that, if anything, the water is increasing.

132. You say they are 200 to 300 feet deep?—Yes.

133. In most other countries they would call that shallow?—Yes. I am putting down a couple of test holes in the Union which may be taken down to 5,000 feet in depth.

134. The deeper you go the steadier is the flow?—No, we do not, as a rule, get much benefit by going over 500 feet.

135. When you have irrigated all the land, what are your chances of getting people to occupy it?—Just at present the demand is being met well enough from inside.

136. The lands are being taken up as quickly as you can irrigate them?—At present it is so. In the last few years land has been taken up as fast as it has been available.

137. Then you think that later on you will find sufficient people with capital to occupy it?—Even now it is open to people from outside to come in and take up this land, and I know of many places where they would be welcome.

138. Are they coming all the time?—Very few are coming from outside.

139. It is your own people who are taking it up?—Yes.

140. You regard the outlook for your irrigation areas as very hopeful indeed?—Yes.

141. **(Mr. Lorimer.)** If there are certain farmers in an irrigation district who decline to come under the operation of an irrigation scheme, what becomes of them?—If the owners of two-thirds of the land capable of being irrigated are in favour of the scheme, the minority can be forced in.

142. And have they any liberty to go out?—No, they must either pay the rates or sell out.

* *See* statement subsequently furnished by the witness, printed as Appendix VI., p. 53.

143. What do you propose to grow on the irrigated fields as compared with what is grown now? Do you expect that your return will be increased crops or more valuable crops?—More valuable crops.

144. And is there a general assent to it, as far as you know, where the system has been applied?—Yes, they are most enthusiastic.

145. You did not tell us what has been the result financially, so far, of these schemes?—Before irrigation the land yielded nothing.

146. Then you got farmers on the land who must have made a revenue?—They were purely pastoral farmers and they have now become agricultural farmers.

147. They made something before, but make much more now?—Yes.

148. What is the nature of the labour colony at Kakamas—who are the people there?—It is for the submerged people. They are people who are not fit to be put on the land or to hold title at all, they can only work under supervision.

149. Do they become fit after experience?—A few of them do. But the Dutch Reformed Church who run these colonies have found by experience that the older generation of people who are put on these labour colonies can very rarely be trusted to shift for themselves. The Church place their hopes on the children.

150. Do these men earn wages or just get their keep?—In some cases they hold agricultural lands under certain conditions, but do not hold under title. Others are not even fit to do that, but labour for a wage.

151. Do these men ever become fit to stand on their own feet?—A few do, certainly.

152. What you call rates—10*s.* and 20*s.* a morgen—those are not what we call rates in England? It is a rate plus something to pay for the irrigation, is it not?—That rate is entirely to cover interest on capital and redemption on the capital cost and running costs.

153. Where do you get the water for this irrigation? Is it all by boring?—No, it is perennial or flood water in the rivers.

154. Have you water obtained by boring used for irrigation?—Yes, to a small extent.

155. Have you plenty of overflow water so far as you have gone?—Yes.

156, And for much larger operations than you have hitherto engaged in?—Yes.

157. The variations in the rates are certainly striking? In one case you spend 100*l.* a morgen and that pays well?—Yes. In that case they go in for high-class ostriches and tobacco, and the scheme includes a big reservoir.

158. There is always a continuous supply of water?—No; many of such rivers only come down two or three times a year.

159. Then you store it?—No—only rarely the flood water is spread over the land by furrows.

160. That suffices till next time?—Yes.

161. How much of that land you have irrigated is private land and how much Government?—Practically all private.

162. On the whole you find the people ready to bear the expense?—Yes.

163. **(Mr. Tatlow.)** In regard to price, do buyer and seller readily agree as a rule?—Yes.

164. Is there any provision for settling differences?—No, it must be settled between parties.

165. In the sale of Crown land—what happens then?—It is valued by the Land Board.

166. For pastoral use you consider there is prospect of a great expansion in the future notwithstanding that irrigation will help the arable land?—Yes.

167. **(Chairman.)** Can you explain the position of dolomite water? Has pumping affected existing streams and fountains?—Circumstances are very peculiar. You will see certain areas tinted blue on this map.* Those are dolomite areas. The water gradually dissolves the rock and forms underground channels. You may see water disappearing in one place and coming out miles away at another spot. Owing to the peculiar circumstances in the dolomite areas it is assumed in law that water in the dolomite formation is supposed to circulate in channels, and great restrictions are placed on the removal of dolomite water. It is impossible to dogmatise about the matter. In the Transvaal nearly all the biggest rivers have their origin in dolomite formation-fountains.

168. Are you proceeding with the Hartz River scheme?—It is under consideration. We will probably bring something forward next year. It is a complicated case, as some of the best land is occupied by native tribes.

169. **(Sir Jan Langerman.)** Is Van Wyks Vlei salt?—No.

170. When it was started, was it?—It was largely a matter of politics entirely. It is doing very well now, and the settlers are now getting good wheat, tobacco, and other crops.

171. **(Chairman.)** Can you give a table showing the amount of land brought under irrigation in each of the last five years?—Yes.†

172. And any estimate of land which will be brought under irrigation during the next five years?—Only in respect to which the department has some connection. Because there is a great deal of land which is irrigated by purely private enterprise.

173. Do you not keep track of that?—As far as we can.

174. We should like, as far as possible, an aggregate statement of what has been done and what will be done in the course of the next five years.†

175. **(Sir Alfred Bateman.)** You have had no proper agricultural survey?—No. As regards this census, as I said, it is most unreliable.

176. It was all got voluntarily?—Yes, but half the questions are asked in such a way that a lot of the more ignorant farmers will not give or cannot give a correct answer.

177. One of the most desirable things is to get an agricultural survey?—Yes.

Cape Town, Tuesday, 3rd March 1914.

Mr. JOHN WILLIAM JAGGER, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Steamship, Post, and Telegraph Communications," on "Harbours and Bunkering" on "Empire Development" and "Fruit,"* see *pp.* 60, 102, 160, 317, *and on "Exhibitions," "Statistics," "General Trade Questions," and "Legislation,"* see *pp.* 124, 127, 145, *and* 181, *of* [Cd. 7707.].)

178. **(Chairman.)** You have some evidence to give us on migration and land settlement?—We do not get much emigration to this country, unfortunately. In fact the general impression is that the departures from this country amount to more than the arrivals. Last year, 1912, we had 42,026 persons landed from oversea, and 42,197 embarked. The year before it was rather better—a slight gain in numbers. Of course, no effort has been made on a really large scale to encourage emigration to this country at all, and the country is obviously in a very different position to, say, Australia or Canada. We cannot take any unskilled labour here. I think there is a growing feeling in favour of trying to get people to go on to the land, and in 1912 we passed the Land Settlement Act, under which land was reserved for oversea immigrants, but no use has been made of it so far. Also, just recently, about nine months ago, the Government issued regulations under which farm labourers could be got out, but as far as my information goes, only in a few cases have people

* Not reproduced.

† *See* Appendix VI., p. 53.

made any use of it whatever. Of course, in this country, as you know, the farmer prefers coloured labour if he can get it.

179. The cheapest labour?—Yes, and the employer, broadly speaking, always prefers it for unskilled purposes, because it is more in accordance with the sentiments of the people and is more amenable and more docile.

180. You have no recommendation to make?—No, except that we should be glad if the Government would push on immigration more—not so much immigrants for the towns, but on the land.

181. Are you cognisant with the different schemes for bringing in boys from oversea?—No. But a suggestion was made recently that we might get out boys from Dr. Barnardo's Homes in London, and place them on farms. We had a meeting and discussed the matter, but all the members of the meeting were very much opposed to the proposal because we find it so difficult to place white boys on farms in this country. Farmers are entirely accustomed to coloured labour. I can give you a case that came before my notice the other day. I happen to be a member of the Public Accounts Committee in Parliament. We had before us an official who is in charge of gaols and reformatories in this country. We have several reformatories, I may say—I think three or four. Of course, we keep white lads separate from coloured, and the official was asked, "What do you do with these boys when their time is served." And he replied, "We have no trouble "in apprenticing the coloured boys, but we have much "more trouble in getting white boys placed." And I should say that this is in accordance with the general feeling in the country. And if that is the case with our own children, what would it be with boys from oversea?

182. Then as to the Land Settlement Act?—In 1912 we passed a Land Settlement Act under which the Government is empowered to buy land that may be offered for the purpose of closer settlement, and they spent last year in buying such land 58,000*l*. They cut it up into lots, and then offer it to applicants at very easy terms. Then we have another system which is working very much more satisfactorily. Under it a man may see a farm—there is no limit to the extent—and if he wants to buy it and he can put up one-fifth of the total value, the Government will put up four-fifths for him.

183. He buys from whom?—Anybody. Say a young fellow wants to start farming. He sees some suitable land, and he agrees with the owner for a certain price. He then goes to the Government and says: "I want to buy this farm? The price is 5,000*l*. I can put up 1,000*l*." The Government will then send down their valuators and value the land, and if they are satisfied about it they will advance the other four-fifths. I should say that under that particular system land was bought last year to the extent of about 125,000*l*. It appears to be operating most successfully in the Transvaal.

184. **(Mr. Sinclair.)** As to immigration: your evidence, I think, results in this, that in your opinion there is no field here for the introduction of outside casual labour—I mean white?—Yes.

185. But as regards experts—you think there would be an opening for them?—Not only experts. But I think we have plenty of openings on the land?—If you could make provision for them on the land, which I think you could if it were taken in hand vigorously, we have plenty of room and I would favour it.

186. The Government seem to have directed their attention of late to providing facilities for bringing people to the land?—They have made provision for it. Of course, they have created machinery by which land can be got, but we complain that that provision is not worked with the energy that it should be.

187. Will you please tell the Commission what is the class of land which was reserved by the Government for settlement?—I could not tell you. I believe the purchases so far have been mostly in the Transvaal.

188. You cannot tell us whether it is first-class or second-class land?—No.

189. You tell us that the State is prepared to advance four-fifths of the amount on loan. How is that repaid?—In instalments.

190. Do they include interest and principal? Does the final payment wipe out principal and interest?—Yes.

191. I would suggest that that is a system which has worked with great advantage in some of the other Colonies?—Yes. In this connection I would like to mention that the Government has done a good bit for the landowner. We have a Land Bank making advances to landowners, and that bank has advanced a total amount of four millions, and the whole of that sum is repayable on the instalment system. They are advancing money at a very low rate of interest, 5 per cent. The bank gets it from the State at 3¾ per cent., which is less than what we are paying for it at the present time. On the last loans I should think we pay 4¼ per cent.

192. Is there an actual direct loss made by the State on advances?—On the money we are borrowing now. But there is in addition over six millions of Post Office money which they only pay 3½ per cent. upon. But at the price we are paying to-day we are losing money on advances to the Land Bank.

193. When payments are made under that system are the moneys that come in set aside for repurchases of lands in other directions?—You mean under the land settlement schemes?

194. Yes.—No, I do not think so. The scheme is only in its infancy at present, so we have hardly had time to see how it is going to work. But we have a system under which when loans are repaid they are paid in to loan account.

195. What I wanted to get at, if possible, is whether the fund is used for the purchase of fresh land?—If it really revolves.

196. Then it is automatic?—I could not tell you definitely.

197. Can you tell us whether the system has been availed of to any great extent?—Not the first system, where the Government buy a piece of land and cut it up into lots. I see from the papers laid before Parliament that there was only spent in that 58,000*l* last year. But the other system, since it came into operation last year, has been availed of very much. We have advanced a considerable sum on the four-fifths basis and it has been very successful.

198. That is working very satisfactorily?—Yes.

199. Can you tell us something more on the subject of the land settlement banks?—Yes.

200. How is the capital provided?—It is provided here entirely by the State. It stands at 3,785,000*l*., and, as a matter of fact, I expect we will have to advance more.

201. How is it managed?—By a board of four persons and a chairman, who is practically a State official.

202. Is a Minister of the Crown a member?—No. No Minister of the Crown or Member of Parliament may be a member.

203. And advances are made after careful valuations?—Yes, they are restricted under the Act. There have been so many applications for money that they have exhausted the funds advanced by the Government in the first place, and they have had to reduce their advances to a maximum of 500*l*. They are not advancing at present anything over 500*l*.

204. Has the effect of the setting up of these banks been a reduction in the rates of interest charged?—Undoubtedly. Money is advanced at the rate of 5 per cent. to the landowner plus a certain amount for repayment. I think it is only about 2 per cent. That man pays then 7 per cent., and he is not only paying his interest, but instalments off his capital. In this Province we have some big lending institutions, such as the South African Mutual Insurance Company. They in the ordinary way charge about 6 per cent.

205. **(Mr. Tatlow.)** With regard to this four-fifths arrangement under the land scheme, is that applicable to anybody in the country, or is it given only under some qualification?—No.

206. Incomers can obtain it also?—I should say so.

207. Is there any minimum or maximum? Would it apply to a small loan equally as well as to a large one?—As far as I know, there is no limit on either side.

208. Is it for the value of the land only that that money is advanced, or is it advanced to the newcomer to purchase anything in the way of implements and appliances?—No, I think it would be in the value of the land only.

209. **(Mr. Campbell.)** With regard to migration, is the balance of white people leaving this country?—Of course, you simply have these figures to go by. They show that it just about balances.

210. Do you think there is any possibility of checking that and setting up white immigration?—We hope to do so in time.

211. Is land settlement the means by which you hope to do it?—That is the only one on which we have a definite policy. You could not do the same thing here as in Australia and Canada, because our economic system is based on coloured labour.

212. But the Government has a definite policy in respect of land settlement?—I could not say, as I am not in the Government; I am in the Opposition. We think they do not carry it out very vigorously even if they have got one.

213. You have assisted passages, I think?—Yes, only to men out here who want to bring their wives and families, and if farmers wish to get out labour to assist on the land.

214. **(Chairman.)** Domestic servants?—I think that is stopped.

215. **(Sir Jan Langerman.)** In regard to the Land Bank; the advances are twofold—the one is mortgages on existing ownership and the other is to advance money to purchase land?—I think the system of buying land has been dropped now.

216. Under the Land Settlement Act?—Yes; but that is advanced by the Lands Department. I may add that we have no less than three departments advancing money—the Agricultural Department for creameries, the Land Department for land settlement, and the Land Bank.

217. It is a very small amount for the purchase of land?—Yes, 58,000*l.*

218. Can you tell what proportion of that sum was taken by newcomers?—I should say it was almost entirely taken up by residents in the country. The biggest part of the four-fifths was advanced in the Transvaal. I have no special information, because we have not had the Secretary of Lands before the Committee of which I am a member. But I should imagine it would be entirely for people in the country.

219. Do not you think that the fact of the Government retaining the mineral rights militates against people taking up land here?—Yes, I think so.

220. Because the Government buys it at the initiative of the man himself. He buys practically the mineral and agricultural value, and he has to pay the full sum, while the Government takes the mineral rights for itself?—Yes, I think that feature should be removed.

Cape Town, Wednesday, 4th March 1914.

The Hon. Sir Thomas William Smartt, K.C.M.G., M.L.A., called and examined.

(*For the evidence of this witness on "Steamship, Post, and Telegraph Communications," "Coal for bunkering," and "Fruit,"* see *pp.* 64, 103, *and* 318.)

The witness made the following statement:—

Fortunately a large number of our younger and more energetic men are going on to the land, and I feel sure there will be great developments in this country in a short period of time. I think when you are travelling through the country from here to Port Elizabeth, through the south-western districts, viâ the Cape Central Line, you will be very much surprised to see the advances that are taking place. If you could stop at, say, Robertson, and see the developments in the way of irrigation in connection with the Breede River, and see the character of the country that is being opened up there, you would be astonished at the progress of the agricultural industry and the development of the resources of those districts, as well as all over the country, greatly due, as I say, to the fact that a large number of the younger and more intelligent people in the country with the advantages of education, are going in for farming operations on modern lines.

221. **(Mr. Sinclair.)** Is it your view that the taking up of farms by young farmers is extending to any considerable extent?—I am certain of it, and if you had the facilities to bring in more suitable land for cultivation you would do a great deal more.

222. And is, there in your opinion, available much land for such settlement as you speak of?—Yes, there is a certain amount of land, but I have always held that there must be a certain amount of stimulus given to bring suitable land that is held for speculative purposes within the reach of these people.

223. Is it not the case that the bulk of the best land in the Union is already in private hands?—I cannot speak with any extensive knowledge of any portion of the Union save and except the Cape Province, but in the case of this Province the bulk of the land suitable for closer settlement is in the hands of private individuals.

224. And when the land is made available for settlement, as no doubt it will be, will not the incoming occupant be at the disadvantage of having to pay the increased cost that the present holder is fortunate enough to be able to exact?—I do not know that. I think when you go round to Port Elizabeth you should visit the Sundays River Settlement. You would be surprised at the development that is taking place there. The land in that case has been cut up into small holdings, and the possibility of these small holdings has only been brought about by the judicious expenditure of a considerable amount of capital, by bringing land under water; and the people who are taking up land there are quite prepared to pay a reasonable price for the developed land.

225. And you think the land there is changing hands at such prices as will enable the purchaser to make a living?—The land that was only worth before a few pounds an acre has changed hands now, I suppose, at 30*l.* or 40*l.* an acre.

226. And is that a good sign in your opinion? Does it not handicap the incoming settler?—Well, the answer to that will be for the Commission to visit the Sundays River Settlement, and see the position of those people to-day.

227. You suggest that there is prosperity?—I am certain they are prospering, and I am certain that the Commission, if they go there, will be of that opinion also. We have great facilities in this country for the development of small irrigation areas.

Cape Town, Thursday, 5th March 1914.

Mr. Frank Braybrooke Smith, Secretary of the Department of Agriculture for the Union of South Africa, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce" "Cotton" and "Fruit," see pp.* 176, 274, *and* 318.)

228. **(Chairman.)** Do you see a very great future before the country in the direction of irrigation and the development of agriculture?—There will be a considerable development. If you contrast our irrigation works with the big schemes in Egypt and India, or the Western States of America, of course, we have nothing like those, but we shall do a great deal.

229. I suppose it would be impossible to give an idea of the percentage of development which is obtainable?—The Irrigation Department are making a hydrographic survey of the country now, and in course of time they will have that information, but I do not think it is available at the present time.

230. What progress is in contemplation for closer settlement and the further sub-division of farms?—You will see the provision which the Land Department makes. They offer Crown lands for settlement purposes, but the trouble is that practically all the Crown lands are outlying lands which are at present of very little value for settlement, mostly remote and mostly dry, and very largely malarial. Personally, I do not think much of it is suited for immediate closer settlement. The establishment of large farms will have to precede closer settlement. I do not think you can develop this country by small holdings in the remote parts, except in the case of irrigation settlement; they will have to come about by the division of the farms in the settled districts.

231. That is, land has to follow a compulsory course; first of all you have ranching and then sheep, and then larger farming and then closer settlement?—I think so, that is the natural process of evolution in this country as regards settlement.

232. So closer settlement will proceed from the sub-division of the now large farms?—Yes.

233. To what extent is that going on?—It is going on a good deal in the better districts, not so much through fresh people coming into the country, but through farmers cutting up their farms so as to give their sons a chance. Take the Wakkerstroom district in the Transvaal, which is the best stocked district we have in that Province. Farmers had large farms there and kept large flocks of sheep, but the farmer now says if he keeps it as a sheep farm he can only put one son on the land, but if he converts it into smaller farms he can give his sons a fair chance, and that tendency is going on very considerably; they are now changed from sheep farming to dairying. That kind of closer settlement is extending in most parts of the country.

234. **(Mr. Sinclair.)** You told the chairman that in your view large settlement would have to precede the cutting up of lands into smaller lots?—That is in the remoter areas.

235 That would involve, would it not, the buyer of the small area having to pay a substantial price for the land?—Yes, but, of course, on the other hand, it is as broad as it is long, because if he takes his farm in an outlying district he has to get water on it, fence it, and effect other improvements.

236. But is the land of such a character that when it is cut up into smaller areas the small area will provide the man and his wife and family with a living?—The land varies in this country as anywhere else.

237. But I am asking the question about the class of land that you had in mind when you told us that the larger settlement would have to precede the cutting up into small areas. Having regard to that class of land, how small an area, when it comes to be cut up, would be sufficient to make a modest home for an intending settler?—That is a most difficult question. It depends on circumstances. If the land is under lucerne, for instance, in the Oudtshoorn district, where you can grow five or six crops a year, and where each crop will be a ton or more, and that ton is worth 4*l.*, you can get from 24*l.* to 30*l.* an acre. And that is mainly profit. It does not take many acres under those conditions to make a living. Or the man may keep six ostriches, and from the plucking of each ostrich he may get 5*l.* and on that basis you may make 20*l.* or 30*l.* per acre per annum. Or you may grow tobacco or citrus trees and make 50*l.* to 60*l.* an acre.

238. What extent of such land do you think will be available for closer settlement within the next ten years?—I could not say.

239. Is closer settlement on such lands a practicable proposition within, say, ten years?—Yes, it is coming now. The Oudtshoorn district is closely settled already.

240. But I am speaking of districts that would have to be broken in, first of all, by large settlement. In those districts what areas would you anticipate will be available for settlement in ten years?—It is hard to tell. The average farm is about 6,000 acres, and on many farms you will have choice well-watered valleys, suitable for lucerne or tobacco, and citrus fruit or potatoes, and the rest of the farm will be useful for grazing and mealies. But you cannot give the extent of the areas.

241. I want to get at what field there will be within the next ten years for closer settlement, of which you have spoken?—There will be a good field undoubtedly, but I cannot give you figures,

242. Is there a disposition to enter more upon mixed farming than in the past?—Yes, and to cultivate the land more thoroughly; and the fact that land has doubled in value, as it has since the war, drives people into closer settlement.

243. I suppose the system of itinerant instruction which you have here also helps in that direction?—Yes.

244. Would you say there are substantial practical results from that system?—Yes.

245. Are you of opinion that newcomers would do better to take some time to learn before setting out themselves for practical farming?—Yes.

246. Have you many outsiders who come here to take up farming?—No; most of the people who take it up do not do it directly, but only after they have made money in the mines, or perhaps the sons of those who have made money in that way.

247. The death of the old people, I suppose, helps to cut up the land also?—Yes.

248. The newcomer is scarcely as yet a factor?—That is so. One of the great troubles in regard to the newcomer in this country is that there is so limited a field at present for white labour. If a man goes to America or Canada he knows he can earn a living in some way directly he gets there, and he can in the meantime acquire a knowledge of the country and save a little money. Here, there are not those facilities, and it is a hard job for a young man to find work on a farm where he can gain experience and save a little money to start on his own account.

249. He has to come into competition with the native?—Yes. The farmer here is more used to the native, and they have not the accommodation on the farms for the white man.

250. And they do not want them?—I would not like to say that, to do justice to the farmers. The effect of the white labourer coming here is to demoralise him very often, and I have seen a white man engaged as a groom standing still and watching a kaffir do the work, after he had been here a short while.

251. **(Sir Jan Langerman.)** About cutting up the larger farms. Mr. Sinclair said a man would have to pay much more money?—Yes, probably he would, but

I said that would be compensated for by the fencing and other improvements that had been carried out.

252. But is not that also in consequence of that farm being proved to be of a certain value?—Yes.

253. Otherwise the man would not cut it up?—That is so.

254. So he is quite justified in paying a higher price than he would have to pay for prairie land?—Yes, fully.

255. Speaking generally, would you advocate farming in South Africa on special lines, either agriculture by itself, or ranching, or cattle, or sheep, or fruit, or mixed farming?—On the whole, for the good of the country, I believe in mixed farming, and in special districts special farming. I think the farmer's interests are better distributed, his work is more evenly divided throughout the year, and he does not run so much risk from hail or drought or similar misfortunes.

256. So that, generally speaking, South Africa would not be suitable to have large areas covered by very small holdings?—No, a great part of the country can never be cut up into very small holdings.

257. We cannot look forward to a very large population on the land as some people advocate?—No, not like Belgium, for instance.

258. Nor like Canada nor the Western States of America?—No, on the whole this country cannot carry as large a population as the best land in Canada or the United States of America.

Cape Town, Friday, 6th March 1914.

Mr. George Robert Hughes, Secretary for Lands in the Union of South Africa, called and examined.

259-60. **(Chairman.)** How long have you been in charge of the Lands Department?—Since Union. Previous to that I was Secretary for Lands in the Transvaal.

The witness submitted the following memorandum :—

Department of Lands, Cape Town.

Memorandum on Land Settlement.

Crown lands are being dealt with under various pre-Union Acts and Regulations as well as under the provisions of the Land Settlement Act, 1912, and although the latter-mentioned Act is, as far as possible, being generally applied to the disposal of agricultural land still in the hands of the Crown, it is not expedient to apply its provisions to certain Crown lands even though such land in itself is suitable for disposal thereunder. Circumstances frequently render it necessary to continue to allot Crown lands under pre-Union Acts and Regulations, in order to preserve uniformity of tenure within a special and restricted area.

Pre-Union Legislation.

Cape Province.

The principal Acts in the Cape Province dealing with the disposal of agricultural lands on conditions of occupation and improvement are the Agricultural Lands Act No. 37 of 1882, Act No. 40 of 1895, and Act No. 42 of 1908.

Act No. 37 *of* 1882.—The area of land obtainable by an applicant in terms of this Act may not be less than 4 morgen nor more than 250 morgen in extent, and one-twentieth part of the area allocated must be brought under cultivation or the land occupied shall be enclosed with a substantial fence within two years of the date of issue of the licence under which allocation takes place. The period of the licence is five years, and if, at the end of this term, the licensee has fulfilled the prescribed conditions a deed of grant is issued to him, subject to the condition that an annual quitrent must be paid equal to one-twentieth of the value originally placed on the land when advertised for allotment.

Act No. 40 *of* 1895.—This Act elaborates the principle established by Act No. 37 of 1882, and provides a scheme of land settlement for use in large areas of non-arable or slightly arable ground. The main provisions of this Act are that (1) the successful applicant shall be recommended by a local land board; (2) the purchase price of the land shall be paid in twenty annual instalments; (3) the farm shall be occupied personally by the holder for the first five years; (4) the holder shall be possessed of no other farm property. The successful applicant for a farm obtains a licence to occupy it for five years, during each of which he pays one-twentieth part of the purchase price. At the end of this period, provided he complies with the conditions of his licence, or if after two years he has effected improvements on the farm to the amount of the purchase price, and has otherwise fulfilled the conditions of his licence, the licensee receives title to the land on passing a mortgage thereover in favour of Government securing payment of the remaining instalments due.

Act No. 42 *of* 1908.—This Act introduced a new principle into the disposal of Crown land in the Cape Province. Prior to 1908 it had been a generally adopted rule that no rights to land should be given by the Crown until survey had been effected and the limits of the land to be alienated clearly defined. Act No. 42 of 1908, however, authorised the Government, through the agency of the district land boards, to issue licences over dry areas of unsurveyed Crown land to applicants for what was known as "water prospecting." The idea underlying the Act was that prospectors should not work within three miles of one another and that those discovering water, either by boring or well sinking, in sufficient quantities for farming purposes, should be entitled to obtain a licence to occupy an area of about 10,000 morgen of land for five years, after which the conversion of the licence to a deed of grant would be possible. The Act was not a success, however, the causes of its failure including (*a*) the failure of prospectors to observe the "three mile limit" laid down by the Act and the difficulty of settling which of two prospectors had first commenced operations, so as to ascertain who was entitled to a licence and who was not; (*b*) the tendency on the part of prospectors to claim that water had been found, in sufficient quantities to justify issue of a licence, when a supply perhaps too weak even for domestic purposes had been obtained; (*c*) the belief on the part of prospectors that an attempt to obtain water, even if unsuccessful, justified them in laying claim to a licence deed and subsequent grant. Owing to these and other difficulties it was decided to suspend operations under this Act.

Natal.

With the exception of Act No. 44 of 1904 and amendments thereof, there are no statutes governing the disposal of Crown lands in Natal, and as the provisions of the Act aforesaid are unworkable, Crown land is dealt with by regulations issued by the Governor-General. Crown lands may be disposed of only to persons of European birth or descent, after the same has been advertised for disposal in the Gazette. It is a condition of the lease that the land shall be occupied within three months of the allotment and that the allottee shall reside on the farm for nine months in each year.

Transvaal.

In the Transvaal, Crown land is disposed of in terms of, and subject to the provisions of:—

(*a*) The Crown Lands Disposal Ordinance 1903 as amended by Ordinance No. 13 of 1906.

(*b*) The Settlers Ordinance 1902 as amended by the Land Settlement Act No. 37 of 1907.

Under the Crown Lands Disposal Ordinance, No. 57 of 1903, the Governor may dispose of Crown lands by sale, lease, or otherwise in such manner and on such conditions as he may deem advisable, not repugnant to the provisions of the Ordinance.

Farms are usually disposed of on the following tenure, viz.:—

(*a*) Lease for a period of five years with the option of conditional purchase during the period of lease or at the expiration thereof.

(*b*) Lease for a period of 21 years without the option of purchase.

(*c*) Grazing leases for a period of seven years.

The holdings are subject to conditions of personal occupation by the lessee for a period of eight months in each year.

Orange Free State.

The disposal of land in the Orange Free State is governed by various laws, and those principally used are Ordinances No. 22 of 1902 (Land Settlement Act), No. 13 of 1908 (Crown Lands Disposal), and No. 31 of 1909 (Irrigation and Settlements). The farms are disposed of on lease without right of purchase over a long period, and are subject to conditions of occupation and improvement.

General.

At the 31st March 1913, the total number of holdings within the Union (subject to conditions of occupation and improvement) which were in course of alienation under pre-Union Acts and Regulations was 5,139, in extent 5,699,529 morgen, valued at £3,475,185.

LAND SETTLEMENT ACT NO. 12 OF 1912.

Union of South Africa.

This Act, intended to further land settlement within the Union, was passed during 1912. The Act secures Parliamentary sanction to the principle of purchasing land for settlement purposes, determines the conditions which are to govern the subsequent disposal of land so purchased, and regulates the allotment of ordinary Crown lands which may be found to be suitable for settlement. Its provisions are, generally speaking, applicable to the man of moderate means who, though possessing sufficient capital and the necessary farming experience for the beneficial development of a holding, cannot, unassisted, acquire land on the terms usually imposed by private owners. Such men will be allotted ordinary Crown lands suitable for settlement purposes, or they will be placed on land acquired for the purpose under the provisions of the Act, or land specially acquired for them individually on the conditions hereinafter mentioned.

It may be of interest briefly to outline the provisions of the Act and the procedure adopted in dealing with applications made thereunder. Provision is made in the Act for the appointment of Land Boards, whose functions are of an advisory nature, for any area in the Union, subject, however, to the total number of such boards existing at any time not exceeding five; no member of either House of Parliament or of a Provincial Council may be a member. Land boards consist of five members, three of whom at least must be persons possessing a knowlege of land values, farming, and agricultural conditions in the area for which such board has been appointed.

The Governor-General is authorised to acquire by purchase, either at public auction or by private treaty, private land which is suitable for settlement purposes or exchange Crown land for private land. Every proposal to acquire land must be referred to the Land Board for consideration and report as to:—

(*a*) The value of the land and its suitability for settlement purposes;

(*b*) The water supply and the nature and value of improvements thereon;

(*c*) The demand for other land in the neighbourhood for settlement purposes, the probability of immediate application for the land, and the extent of possible subdivision of the land.

In the event of the Board considering the land suitable for settlement purposes, it must recommend to the Minister of Lands the terms upon which the land should be acquired, the maximum purchase price, and also any special conditions upon which the land, if acquired, should be offered for settlement purposes. The purchase price to be paid by Government may in no case exceed the maximum price recommended by the Board.

One of the most useful provisions of the Act is that which enables the Government to purchase a particular piece of land on behalf of an applicant, provided that he is willing to contribute one-fifth of the purchase price, and gives satisfactory security for the payment of such contribution. Every proposal to acquire land on these terms must be referred to the Land Board for investigation and report, as in the case of proposals for the acquisition of land for settlement purposes generally.

In the event of the purchase of land for an individual settler as aforesaid being approved, the Government pays the balance of the purchase price of the land, and, when transfer has been effected in its favour, the holding is allotted to the applicant on conditional purchase lease for a period of twenty years, during which period the balance of the purchase price, plus any incidental expenditure incurred in connection with the purchase, transfer, and allotment of the land, together with interest thereon at the rate of 4 per cent. per annum, is repayable in half-yearly instalments. In the case of ordinary Crown lands, holdings are allotted on lease for a period of five years, with the option of purchase, which may, subject to certain conditions, be exercised either during the period of the lease or at the expiration thereof, but this is not so in the case of land specially acquired on behalf of an applicant where there is no preliminary lease period and the applicant is deemed to have exercised the right of purchase from the date of the commencement of the lease. The first half-yearly instalment of capital and interest (the instalments are payable in advance) becomes due and payable on the date the lease commences, which is the date transfer of the land is passed in favour of the Government.

In connection with the allotment of land acquired by purchase or otherwise, and of ordinary Crown land, the procedure under the Act is to divide any of such lands as may be suitable for settlement purposes into holdings which vary in extent and valuation according to the district, proximity to a railway line, climatic and soil conditions, &c. The valuation placed on land acquired from a private owner for the purpose of allotment must be at least equal to the cost price, including costs of transfer, subdivision, valuation, &c., and in the case of ordinary Crown lands the present market value of the land. When the land is available for allotment, applications are invited therefor in the Union Gazette and in one or more newspapers, particulars being given in the Gazette notice of the situation, extent and description of the land, the rent, and the ultimate purchase price, in the event of the option to purchase being exercised, and any special conditions which may attach to a particular holding. Holdings must be so advertised in the Gazette for a period of at least ten weeks. As soon as this period has expired all applications received are considered and dealt with on their merits by the respective Land Boards, who submit recommendations to the Minister as to the applicant to whom they consider the farm should be allotted. In the event of there being two or more applicants for the same holding with equal qualifications, it is customary for the board to have recourse to lot. The recommendations of the Board are considered by the Minister, in whose discretion it is either to approve or refuse the recommendations. As far as possible, preference is given to applicants who are not already the owners of land. It is also provided in the

Act that holdings may be offered by notice in the Gazette to applicants from oversea. Holdings so offered may not be allotted until at least three months have expired from the date of the first publication of the notice.

Allotments, whether of land specially acquired on behalf of an applicant, or of land advertised as available for settlement purposes, can only be made to applicants possessing the qualifications prescribed by the Act, *i.e.*, they must be at least 18 years of age, possess qualifications sufficient for utilising the land the subject of the application; intend in good faith to occupy personally and develop and work beneficially the said holding; be of good character; possess capital sufficient to develop and work the holding beneficially; or, in any special cases, possess such amount of capital as, after report by the board, the Minister may deem fair and reasonable. Applicants are furthermore required to declare that they will develop and work the holding exclusively for their own benefit and the members of their families, if any.

Holdings which are gazetted as available for disposal under the provisions of the Act are allotted on lease for a period of five years, the rental being calculated as follows:—

For the first year no rental is charged;

For the second and third years rent is charged at the rate of 2 per cent. per annum on the valuation (*i.e.*, the ultimate purchase price); and

For the fourth and fifth years at the rate of 3½ per cent. per annum on the valuation.

All rentals are payable half-yearly in advance. The allottee has the option of acquiring the land at any time during the currency of the lease, or at the expiry thereof, on terms of conditional purchase extending over a period of 20 years, the purchase price, with interest thereon at 4 per cent., being payable in 40 equal instalments, half-yearly in advance. The allottee may pay the balance of the purchase price at any time or in instalments of not less than 100*l.*, but he cannot claim a Crown grant transferring the holding to him until 10 years have expired since the land was allotted to him. This provision also applies to cases where Government has specially acquired land on behalf of an applicant.

The two most important conditions governing allotments are those requiring the occupation and improvement of holdings by the allottees. The success of any scheme of land settlement must, to a large extent, be dependent on a strict compliance with those conditions, and they are, therefore, fully defined in the Act. Non-compliance by allottees with the conditions of personal occupation has been, in the experience of the Department, the principal default with which it has had to contend. Every allottee is required personally to take possession of the holding allotted to him within six months from the date of allotment, and must reside thereon and make it his usual abode for at least eight months in every year, provided that exemption may be granted by the Minister from compliance with this condition on the grounds of illness or other good reasons. Every allottee of a holding on which no improvements exist at the date of allotment must, during the first five years of his tenure, effect improvements on the land to a value of not less than 10 per cent. of the ultimate purchase price of the holding. All rights to minerals are reserved to the Crown, and holdings may not be sub-let, nor may the leases thereof be assigned, transferred or hypothecated, without the consent of the Minister.

Advances may be made for the purpose of providing a lessee with stock, implements, seeds and other things necessary to develop and work the holding beneficially. It is also provided that the Government may before or within twelve months after the allotment of the holding cause work and labour calculated to improve the holding to be effected thereon, in which event the cost thereof is treated as an advance to the allottee. Advances may not exceed 50 per cent. of the total capital expended by the allottee on the improvement of the holding, and the total amount of advances so made to any allottee must not exceed 500*l.* The advances bear interest at the rate of 4½ per cent. per annum, and are repayable in seven half-yearly instalments, the first of which becomes due and payable at the expiration of 18 months from the 1st January or 1st July, whichever of these dates may next succeed the date on which the advance was made.

The Land Settlement Act was brought into force in October 1912, and the following figures indicate the extent of the operations thereunder:—

Land purchased in Terms of Section Ten of the Act, for Subdivision and Disposal, during the Year 1913.

Province.	Area.		Purchase Price.		
	Morgen.	Sq. Rds.	£	*s.*	*d.*
Transvaal -	1,369	161	4,921	1	6
Natal - -	12,940	300	49,803	2	2
	14,309	461	54,724	3	8

Approximate average price per morgen—£3 16*s.* 6*d.*

Land purchased in Terms of Section Eleven of the Act, under which One-fifth Contribution is to be paid by Applicant.

Applications.	Number.	Area.	Valuation.	Average price per Morgen.		
During year 1912.						
		Morgen.	£	£	*s.*	*d.*
Approved -	19	19,295	34,163	1	15	5
Refused - -	25	26,021	69,775	2	13	7
Abandoned -	13	8,973	19,535	2	3	6
	57	54,289	123,473			
During year 1913.

Refused - -	91	53,241	165,414	3	2	2
Abandoned -	81	59,642	138,870	2	6	7
	272	158,628	457,408			
Under consideration at 31.12.13.	20	9,197	28,439	3	1	10

No allotments of ordinary Crown lands advertised for disposal in terms of section 16 of the Act were made during 1912, owing to the period of gazettal prescribed by the Act not having expired at the 31st December of that year.

The number of allotments made to the 31st December 1913 was 120, in extent 121,024 morgen, valued at 102,797*l.*

The total number of holdings gazetted to the 31st December 1913 was 182, in extent 223,661 morgen, valued at 151,807*l.*

Area of Crown Lands in the Union.

Cape Province.

The total area of the vacant Crown lands in the Province of the Cape of Good Hope, including reserves other than forests, but excluding commonages, outspans, locations, and the first railway grant, is approximately 10,690,611 morgen. Of this area 1,780,878 morgen are surveyed Crown lands, which are vacant, and 3,948,966 morgen comprise unsurveyed Crown lands, which are also vacant. The remainder of the area consists of reserves.

The above statement was prepared in June 1909. A fresh statement is being prepared, but it will take some months before it will be completed.

Natal.

The area of vacant Crown lands in Natal and Zululand which has been surveyed into farms is 403,825 acres. The area of unsurveyed Crown Lands not specially reserved for natives is 1,688,580 acres.

Transvaal.

The total area of Government ground in the Province of the Transvaal is 10,196,306 morgen. Of this area approximately 2,724,747 morgen has not as yet been surveyed into farms. The area given above includes locations registered in the name of the Government, and town lands not yet granted to Municipalities.

Orange Free State.

The total area of Crown lands in the Orange Free State is approximately 52,880 morgen.

Speaking generally, the areas of unalienated Crown land are situate:—

(*a*) In the Waterberg, Rustenburg, Zoutpansberg, Marico, and Barberton districts of the Transvaal.

(*b*) In Bechuanaland, and in the Kenhardt, Prieska, and Namaqualand divisions of Cape Colony.

(*c*) In Zululand and along the Drakensberg mountains in Natal.

Transvaal.

As regards the unalienated Crown land in the Transvaal, it is well known that the northern districts are, for the most part, extremely dry. Owing principally to the lack of water on farms which had been allotted in previous years the number of surrenders or cancellations of leases in the Transvaal in 1912 almost equalled the number of allotments. This was mainly due to the lessees being unable to work their holdings for want of a sufficient water supply, or to their not occupying the land at all from the same cause. In several cases the allottees had spent portion of their capital in unsuccessful attempts to find water, and, as it was formerly the practice to forfeit or to accept surrender of leases and merely re-advertise the farms for disposal as they stood, it follows that the allottees who surrendered their holdings, or whose holdings were forfeited, were not, in all probability, the first persons to put, on these farms, capital into useless well-sinking. There is no doubt that the leasing of dry farms proved in the past a distinct failure. They were taken up mostly by men of limited capital who could ill afford to lose the cash part of it in sinking wells, with the result that after spending 100*l.* or 150*l.* on such wells, without obtaining an adequate water supply, the allottees had, as a rule, neither the means nor the will to retain the farms. The policy of boring for water on vacant holdings wherever necessary, before advertising the land as available for allotment, has in consequence been adopted.

In the north-eastern Zoutpansberg and in the Barberton district the greater portion of the Crown lands is unsurveyed and is principally situate in malarious regions. There has been little or no active demand for land in these parts, but in the Zoutpansberg district, between Pieterberg and Louis Trichardt, there is a fairly large tract of Government land which is in demand, and boring operations are now being undertaken on a number of farms situate within the area, with a view to their being made available for settlement purposes.

In the Waterberg district the farms along or near the Limpopo river are being slowly taken up, but certain holdings have been advertised for some considerable time past without result. The farms, in what is known as the Pamen Veld, are very small—approximately 1,500 morgen—and the applicants for such farms are generally local men. No boring is being undertaken in this part, owing to all available drills being engaged on farms nearer to the railway line. The land is poor for agricultural purposes and is far distant from a market. It is not, in fact, likely to be taken up except for cattle-farming, in which event it seems certain that the holdings will have to be from 3,000 to 5,000 morgen. The farms in the Harde Veld in the north-eastern portion of the Waterberg district are also very dry, and, unless for cattle ranching on an extensive scale, are not likely to be taken up in the near future. In the area known as the Springbokflats, to the east of the railway line from Pretoria to Pietersberg, there are vacant Crown farms which have been noted for water-boring operations. With isolated exceptions none of the vacant Government farms in the Waterberg district have permanent water.

Orange Free State.

With regard to the Orange Free State, no Crown lands are available at present for disposal in that Province. There are forty Government farms held under lease, mostly for a period of five years. When the leases expire the advisability of the disposal of the land under the Land Settlement Act will be considered.

Cape Province.

In the Cape Province there is practically no Crown land available for settlement purposes outside the North-Western districts. In Bechuanaland, however, thre are large tracts of vacant Crown land. In the Mafeking district the area belonging to the Crown is approximately 248,200 morgen, *i.e.*, about 80 to 100 farms; on that area boring operations will be undertaken before the farms are disposed of. There is a tract of land in the Kuruman district, about 390,000 morgen in extent, *i.e.*, approximately 160 farms, which has for years been occupied under authority of grazing licences, whose holders have, in many cases, established water supplies by sinking wells. It is, therefore, not the intention to withhold these farms from disposal until boring has been completed, as the land is now suitable for occupation.

In the Gordonia district there are large areas of vacant Crown land, but the country consists of rolling sand-dunes with very low scrub, and practically no water supplies for the greater part of the year. Water-boring is being commenced to the west of the Nosop river, but the only water found, so far, has been brackish.

In Namaqualand there are about 100 vacant surveyed farms and on these it is proposed to bore for water as soon as drills are available. The difficulty hitherto has been that steam drilling is impossible owing to lack of fuel and to the distance which water had to be transported. In the Van Rhynsdorp division the Government has about 50 farms, which the magistrate reports are unsuitable for effective settlement, the land being suitable, for the most part, for grazing purposes only.

Natal.

In Natal most of the available Crown lands is situated in districts remote from markets and, with the exception of a few areas, it is more suitable for grazing than for agriculture.

There are about 10,000 acres of Crown land in the Alfred Division, but the larger proportion, which is situate in the neighbourhood of the Ingeli mountain, is unsuitable for European occupation and is unlikely to be applied for, except for summer grazing purposes. In the Umzimkulu division the Government owns approximately 45,000 acres of land, 8,000 acres being situate in the neighbourhood of the Umtamvuna river, while 7,000 acres are situate on the Oribi flats. The Umtamvuna and Oribi flat lands are well adapted for general agricultural purposes, but, owing to their distance from the railway, the settlers who have taken up land in the district have considerable difficulty in getting their products to the markets, and it is unlikely that the remaining farms will be taken up until either the railway is extended or the people are allowed to use ox-transport. The remaining lands in the division are much broken in character. There are about 30,000 acres of Crown land in the Ixopo division, but

they are mainly situate in inaccessible parts of the district, in addition to being broken in character. The Inhlamvini lands are the exception, however, and these have been taken up, excepting 12 sub-divisions. In the Ipolela, Underberg, and Impendhle divisions there are approximately 160,000 acres, but most of the land is situate in the immediate neighbourhood of the Drakensberg mountains, and is unsuitable for occupation. In the other divisions there are also very few farms available which are suitable for settlement. Speaking generally, the Crown land is suitable for grazing only, is situated in thorny or broken country, is too far from the railway, or is entirely unfit for permanent occupation by Europeans.

261. **(Chairman.)** We are indebted to you for the very full memorandum you have prepared on the amount of land available, and the legislation in force. I wish you to state to the Commission what the operations of your department are precisely; what it is you aim at, and what progress you have made?—The department, of course, deals with land such as town lands, and land which is quite divorced from land settlement.

262. That we will leave out?—You want me to confine myself to land settlement?

263. Yes.—The provisions of the Land Settlement Act, which are outlined in the memorandum submitted, indicate the policy pursued in connection with the acquisition of land for settlement purposes, and the steps that Government may take with a view to the settlement not only of waste Crown lands of the country, but also in developing private lands. Section 10 provides for the acquisition by the Government of private lands for general settlement purposes, and during 1913 an area of 14,309 morgen was acquired at a cost of 54,724*l*., the average cost being 3*l*. 16*s*. 6*d*. per morgen. When land is acquired, it is sub-divided into holdings for disposal to the public, and in each case of lands so acquired it means displacing one person and substituting several settlers for him. That is under section 10. Section 11 enables the Government to acquire private land for any person possessing the qualifications laid down in the Act. The land is chosen by the applicant himself. He usually obtains an option, which must be in favour of the Minister. He brings it to the department, and gives a guarantee that he is prepared to contribute one-fifth of the cost price of the land. The Land Board inspects the land and, if it considers the land is worth the price asked, and the applicant is otherwise suitable, the Board will favourably recommend the application. The Act was only brought into operation on the 16th October 1912, and in that year 19,295 morgen were acquired for private applicants to the value of 34,263*l*.

264. Acquired from whom?—From private owners

265. Expropriated?—No, it is a question of voluntary purchase. It is a matter of negotiating with the private owner, and if the negotiations are successful, of acquiring the land by the Government. I think I might refer to the statement I have prepared. The extent to which the public have taken advantage of section 11 during the period October to 31st December 1912, is shown by the fact that 57 applications were submitted. During 1913, 292 applications were submitted in terms of section 11, of which 100 applications were approved. The area of land involved was 45,745 morgen, the valuation was 153,124*l*., and the average price was 3*l*. 6*s*. 11*d*. The average price of land acquired during 1912 under section 11 was 1*l*. 15*s*. 6*d*., and the applications submitted represented 105 applicants, partnerships included. It might be interesting to have some information as regards the nationality of the applicants: 79 were South African, 21 British, 3 Colonial (other than South African), and 2 naturalised British subjects, and of the 292 applications received during 1913, 65 per cent. were in respect of land situated in the Transvaal, 22 per cent for land in the Free State, 9 per cent. for land in the Cape, and 4 per cent. for land in Natal. It is therefore evident that the greatest demand is for agricultural land situated in those parts of the Transvaal and Free State where in normal seasons a moderate rainfall for summer crops may be anticipated. With the exception of the Cape Province, the holdings applied for were of 500 morgen. The Cape applications are principally for land suitable for stock-raising, and therefore a larger area is necessary. I would like to emphasise this, that there is little or no evidence at the disposal of the department that there is any demand for land for agricultural purposes of from say 50 to 75 morgen. There is a good deal of talk about adopting a system of small holdings similar to that prevailing in the western parts of the United States and Canada of 160 acres, as a dry holding. My experience is that there is nobody in this country who comes to the Government asking for a holding of so limited an extent in order to conduct dry land farm operations.

266. The size being ——?—Approximately 500 morgen—well over 1,000 acres. Apart from that, the experience of the department is quite opposed to small holdings for dry land farming. Under the Crown Colony Government, settlers were placed on an area in the Waterberg district of the Transvaal known as the Springbok Flats. Previous to the war that area was leased by the Republican Government for grazing purposes, and little or no cultivation was carried on. The Crown Colony Government had the land inspected. It was said to be suited for agriculture, so they started a settlement. Of the 31 settlers who were placed on the land originally, only 15 now remain, the places of the other 16 have been filled up by other persons. The holdings allotted were 640 acres in extent—one square mile. The nationality of the settlers was mostly South African and Australian, and they found that a holding of 640 acres was altogether too small. They had, of course, small stock and cattle on the holding which required grazing, and they applied to the Government for an increased area. After investigation by the Land Board it was decided to give them another 640 acres, which brought the area to, say, 500 morgen. Then, again, the late Transvaal Government laid out a settlement at a place called Stompiesfontein, on the East Rand about 30 miles from Johannesburg. This land was subdivided into 80-morgen plots, and the persons placed on it were mostly Dutch. They received assistance in the shape of building and fencing material, draught animals and breeding stock. At the present time the results of the settlement clearly show that 80 morgen is too small for dry-farming operations. I am now speaking more particularly of ordinary mixed farming. What I am saying has no relation to the size of the holding necessary for fruit-growing in the Western Province, where, of necessity, it is smaller.

267. Or for dairying?—It is rather too small for dairying in the Transvaal. Coming now to section 16, *i.e.*, the section under which the department offers available Crown lands for disposal in terms of the Act, 182 holdings have been gazetted since the Act came into force on the the 16th October 1912, representing an area of 223,661 morgen, valued at 151,807*l*. The average area of the holdings was 1,228 morgen, and the average value per morgen approximately 14*s*. This indicates the class of Crown land available for disposal, and it may be of interest to the Commission to know the extent to which there is a demand for land. During 1913, 127 allotments were made under section 16, of a total area of 122,141 morgen, representing a value of 106,207*l*. The approximate value per morgen of the land was 17*s*. So you can see that the better class of land offered was taken up. The number of applications made or submitted for the 120 holdings was 2,740, of which 2,074 were for land in the Transvaal, 372 in the Cape, and 294 in Natal. I want to make it clear that when I say there were 2,740 applications it does not imply that there were 2,740 applicants. Many applicants made alternate applications. I should say that the figure 2,740 would require to be reduced by one third to get at the number of different applicants who made application. But I best illustrate the point by giving you one or two special instances. On the Bechuanaland border, the Government had three small holdings, portions of the farm Maribogo, each in extent 600 morgen. 156 individuals made application for the three holdings, submitting 226 applications. In the Elliot district of the Cape

7 holdings were offered, being portions of the farm Lichfield. They averaged in extent about 175 morgen to 200 morgen. 107 individuals submitted 372 applications. In the Heidelberg district, Transvaal, six holdings on the farm Wolvenbank of an average area of from 350 to 390 morgen were offered. 230 persons made 549 applications. For the farm Roodepoort in the same district we had 114 individuals making 78 applications. In this case the figures are reversed, the difference representing partnerships. For three holdings in the Rustenburg district, Transvaal, 141 persons submitted 250 applications. It is perfectly obvious that there is a very considerable demand from persons resident within the Union itself for good agricultural land. May I now deal with the available Crown lands? I think it is fairly well dealt with in the memorandum submitted, but I should like to give a few details as to where the land is situated.

268. Have you a table of the whole of the lands?—I did not attach it to this, but I can supply a copy to the Commission.*

269. It is rather scattered?—I have picked out the principal areas. Take the Cape Province. You can dismiss the Free State from your consideration altogether, because at present there is only a limited extent of land in the hands of the Crown—some 60,000 morgen. In the Cape, Calvinia district, 351,000 morgen; in Kenhardt, 1,120,000 morgen; Namaqualand, 2,491,000 morgen; Van Rhynsdorp, 268,000 morgen. All these districts adjoin and the class of land is similar; that is to say, it is of poor quality and the average size of farms in that area may be gauged from a list of holdings recently published in the Gazette of land available for lease. There were 60 holdings offered and the average area per holding was 8,921 morgen, or about 20,000 acres.

270. You have a total in the Cape Colony of ——?—The total is given in my memorandum, and is in round figures 10,000,000 morgen. Taking the Transvaal, in the Barberton district, the Government has 1,061,000 morgen; in Lydenburg, 822,000 morgen, in Rustenburg, 477,000 morgen; Waterberg, 1,435,000 morgen; Zoutpansberg, 5,199,000 morgen.

271. The total for the Transvaal is ——?—Those figures do not represent the total for the Transvaal, but the total in the Transvaal is about equal to the total in the Cape—in round figures 10,000,000 morgen. I would, however, point out that these areas include land which has been set apart for game reserves and also land which, since the figures were compiled, has been noted provisionally for alienation to natives as locations. But in each of these districts there is only a very small percentage of land which is free from malarious conditions. I should also explain, as regards the Crown lands in Rustenburg (because portions of that district are the most fertile in the Transvaal, and the Commission may possibly be misled unless I explain), this particular land is in the northern part. It is not in the fertile region of the Zwart Ruggens Valley. Then as regards Natal, the total area in Natal is 1,688,000 acres, and the principal districts in which it is situated are Underberg, 131,000; Alexandra, 49,000; Ixopo, 60,000, and Vryheid, 48,000. Much of this area is malarious. The land in the Underberg division is healthy but is situate on the slopes of the Drakensberg, and is only suitable for grazing, and very rough grazing at that. It is not suitable for disposal on the terms of occupation provided in the Act, and may, therefore, be ignored. So far as I can ascertain, no attempt has been made to obtain a soil survey of the whole Union. The only attempt, and I think it is one which does not afford much help, is in connection with the last Census. I think it is unreliable, because I believe the majority of the farmers did not understand the returns they were called upon to furnish. I have a report of certain land which was held jointly by the Government and the Rhodesian Railways in Bechuanaland. The Government's ownership represented two-thirds and the Rhodesian Railways one-third. The price paid by the Government for the interest of the Rhodesian Railways was 34,500*l*. The Land Board of the Free State was sent to inspect it with a view to its subdivision for settlement purposes. I think it would be of interest if I read a short extract from the report of that Board. The area is roughly 400,000 morgen and lies west of Kuruman. Along the Kuruman River water is found within 60 feet of the surface. (*Reading extract.*) They recommend that holdings in that area should be not less than 2,500 morgen.

272. You have given overhead figures?—I can give you details.

273. No, what we want is the land suitable and available for settlement?—The various Land Boards are investigating the lands suitable for settlement. After the reports are to hand, applications are invited for the land.

274. And when you invite applications, do you get land settled in the majority of cases?—In most cases it is offered with right of purchase, but in certain instances it is offered on a purely grazing lease. The majority of the land in the Waterberg is really suitable only for cattle ranching. It is impossible to impose conditions of occupation or improvement. The areas that have to be given out in the Waterberg, which is suitable for cattle grazing, average about 4,000 morgen, *i.e.*, under 9,000 acres.

275. Is land settlement going on at a satisfactory rate?—It is a matter of opinion. I think, as far as can be seen at present, it is going on satisfactorily. Last year Parliament voted 100,000*l*. in connection with the Land Settlement Act and to the 31st March the commitments of the Government exceeded 200,000*l*. On the Supplementary Loan Estimate submitted to Parliament this Session, provision for 100,000*l*. is made—that is to enable the Government to meet its commitments: in other words, Parliament voted us 100,000*l*. and we have spent 200,000*l*.

276. I suppose land settlement is governed largely by two factors, railway construction and irrigation?—The whole question, I think, is summed up in the fact that people must have a ready access to market, and it is all the better if there is water. Of course, the Government has been faced with this fact, that most of its land, apart from that situated in the malarious regions, is of a dry character, and they have had to undertake boring operations before they could invite applications for it. The department has found considerable difficulty in dealing with areas which were allotted previous to Union, especially in those areas I have mentioned in the Cape—Calvinia, Kenhardt, and around Kuruman. Conditions of occupation were imposed, and as the land is waterless in most cases, certain settlers who spent their all in endeavouring to find water have had to abandon their holdings. The object of the Government has been defeated, and instead of putting people on the land and helping them to get on their feet, they have converted them into paupers. It is now the invariable practice of the Government to bore for water in these dry areas. I understand that the Director of Irrigation has explained fully the operations of his department. I should like to mention in regard to Namaqualand, Kenhardt, and Calvinia that the estimated carrying capacity is one sheep to 21 acres, and the water supply, generally speaking, is brackish.

277. The water you bore for?—Surface water. The Irrigation Department is finding sweet water in portions of the area. As bearing on the increased value of the land, I might give you a few figures dealing with the Imperial Land Settlement Boards. The settlements formed were undertaken under Crown Colony Government. In the Free State, 546 settlers were placed on land in extent 655,563 morgen (the average size of the holdings being twelve hundred morgen), and valued at 1,033,000*l*. The average valuation of the land per morgen is 1*l*. 11*s*. 6*d*. In the Transvaal, 443 settlers were placed in possession of 461,549 morgen, the average size of the holdings being 1,207 morgen and the valuation of the land 375,293*l*., while the average value per morgen was 16*s*. 3*d*. In

* Not reprinted.

1912, Parliament passed an Act which enabled the Government to issue Crown grants to these particular settlers, and simultaneously with the registration of the Crown grants to take a bond for their indebtedness, which consisted of the purchase price of the land plus the advances which had been made. I think the figures which I will quote are of interest in showing the extent to which the land has appreciated in value since the date of this settlement in 1902 and 1903. Under the Act, whenever a settler desires to dispose of his ground, he has to give the Government one month's option at the price of the offer he has received for the land. During 1913, 35 holdings in the Orange Free State were so disposed of by settlers (the option of purchase was not exercised by the Government), representing an area of 44,025 morgen; the bonds, which represent the purchase price of the land plus the advances—I regret I have not got the figures showing the purchase price and the advances separately—amounted to 71,688*l.*, and the sale price to 149,056*l.* Included in the 149,056*l.* must, of course, be considerable improvements, but the improvements would not equal the purchase price of the land, which must be something less than 71,688*l.* as that figure includes the value of advances made. In the Transvaal there have been only four holdings so dealt with, representing 5,308 morgen, on which bonds were taken for 4,266*l.* and the sale price was 11,097*l.* In each case the bond must be paid off.

278. Does that indicate the success of the experiment?—Not necessarily, but it indicates that the land has gone up in value. It may represent unearned increment in some cases, but it would probably represent in most cases an incremental value which was contributed to by the settler. In the Free State, taken as a whole, the settlers have been uniformly successful. They were placed on good land to start with. The land selected was very much better than land purchased by the Crown Colony Government for similar purposes in the Transvaal.

279. How do you contrast the result attained with the cost?—I have no means of assessing the value of the settlers per head to the State by reason of their agricultural operations. The State will get some benefit in the increased traffic over the railways, the contributions towards the customs revenue, and other indirect ways. I think the settlers have benefited the country to a very large extent in that they have introduced new methods of farming, and this has had a very wholesome effect on their neighbours. I think it is evident from the reports received, quite apart from the fact that the settlers are getting good prices for their land when they dispose of it.

280. Are a large number selling and going north?—Out of 546 in the Free State, 35 disposed of their holdings during 1913. Another factor, I think, which enables me to say that they have been fairly successful is that they pay up their indebtedness to the Government regularly. I should like also to mention that in 1913 a return was called for in Parliament as to the total number of farms in the Union.

281. Will you hand it in?—Yes.* The same return asked for information as to the area owned by members of the Transvaal Land Owners' Association. I am not in a position to say definitely what is the membership of the Association. The area owned by members of that Association within the Union is very considerable—5,754,924 morgen, so that you are faced with the fact that there is a very large area within the Union which is owned by, comparatively speaking, a few companies and persons.

282. **(Sir Jan Langerman.)** I suppose it would not be fair to ask you whether the land companies are anxious to get rid of their land on favourable terms to settlers?—I can only say this, that the terms and conditions offered by land companies which have come to my notice are, I think, most illiberal. They would not induce me to take up a single acre. In fact, they cannot compare with the terms offered by the Government in the Land Settlement Act, 1912. Not only that, but from day to day in the Transvaal I interview lessees of land companies who are dissatisfied with the terms on which they hold land, and desire to come under the provisions of the Land Settlement Act.

283. Now, you have given the number of settlers at the date of Union. What was the number of the original settlers who originally settled on the land? There are two periods, one under Crown Colony government and one under self-government. Can you give us the number placed on the land under Crown Colony government who are still on the land?—The figures are 546 in the Free State and 443 in the Transvaal. That is under Crown Colony government—say 1,000 approximately.

284. But are there not in the Transvaal, created by the Crown Colony government, settlements where practically the whole of the settlers have left?—No. But there is one settlement in the Transvaal, created under Crown Colony government, where the Government have never received a penny in respect of rent due, nor in respect of advances made, and where there is every likelihood of the Union Government having to pay compensation to the settlers; in other words, it is an absolute failure. It was an irrigation settlement in the vicinity of Potchefstroom. I do not think the Crown Colony government was wholly to blame for this failure; it acted on professional advice, which appears to have been unsound.

285. What was the cost of the settlement there to the country?—Off hand, I would not like to say, but certainly not less than from 40,000*l.* to 50,000*l.*

286. The Carlis Settlement—did not that cost a quarter of a million?—It is not quite fair to fasten that upon any Government. Just after the war, there was a certain class of burgher without land and without means of livelihood. These men were gathered into camps, and subsequently companies were formed to place these men on the land. The companies purchased land, and the Government gave the necessary financial backing. Burghers were placed on the settlements, and the settlements practically proved failures. The companies went into liquidation, and the Government, as guarantors, took over their assets. In the case at Potchefstroom, to which you refer, the Carlis Settlement, the loss was heavy—something like 50,000*l.* or 60,000*l.* Perhaps I was not quite right

* The witness subsequently handed in the following statement :—

The Number of Farms within the Union of South Africa.

	No. of Farms.
Transvaal	11,900
Cape Province	17,900
Orange Free State	17,052
Natal	8,653
Total	55,505

The above figures relate to original farm grants from the Crown. It is not possible to give an accurate estimate of the holdings actually utilised as separate farms, as original farms have been much subdivided and subdivisions have again been subdivided. Many of these subdivisions are being used as independent farms and many are combined with others to make one farm; this process of subdivision and amalgamation continuing incessantly from day to day.

Return of the Number of Morgen owned by Members of the Transvaal Land Owners' Association.

	Morgen.	Sq. rds.	Sq. ft.

*Cape Province	357,259	357	108
Orange Free State	31,439	407	—
Natal	10 763	204	108
Total	5,754,924	253	72

*Registrar of Deeds :—	Morgen.	Sq. rds.
Cape Town	37,090	564¾
Kimberley	6,229	393
Vryburg	313,939	—
King William's Town	—	—
Total	357,259	357¾

The above returns were prepared in June 1913.

in saying that there was no settlement instituted by the Crown Colony Government where all the settlers had left. There was one, the White River Settlement, near Barberton. The settlement was laid out on expert advice (it was an irrigation settlement): I do not think that at any time more than 10 or 12 people were settled on it. In course of time they all disappeared.

287. Do you think, looking at the settlements in the past under Crown Colony Government and Union, that these have been successful schemes?—There is a difficulty in contrasting the two.

288. Since the war—the whole period, whether Crown Colony or Union—do you think the settlement schemes have been a success?—A certain aspect of the settlement schemes has been successful and a certain aspect has been unsuccessful. I am now looking at it from the point of view of cost to the country. The best kind of settlement has proved to be the one under the Crown Land Disposal Act of the Transvaal, where land was allotted to applicants, but no monetary assistance was given. Most of the losses that have accrued on land settlement since the war in the Free State and Transvaal have been due to the financial assistance granted to settlers. Where the Government has merely contented itself with allotting land on easy terms of payment and with security of tenure, successful results have accrued and the allottees have been able to meet their obligations. The Crown Colony land settlement scheme in the Transvaal was a partial success only. There was a good deal of loss, but in the same way as the settlers in the Free State have been an example to their neighbours so have the settlers in the Transvaal. Indirectly the country has gained a good deal by reason of the fact that you have had these men from other parts of the world who have brought new ideas and assimilated the conditions of the country.

289. Were the successful settlers originally all people who were capable of farming and who had a knowledge of farming previously?—No. Many of the settlers selected by the Crown Colony Government had no previous knowledge, and many of these have disappeared. I instanced in my evidence earlier that of the 31 settlers on the Springbok Flats in 1902 and 1903, only 15 remain to-day. Sixteen have disappeared, either through death or removal from the district, on transfer or surrender of their holdings.

290. The class of settler the Government would select—would it be a settler with money in preference to one with practical experience? — The one with experience, undoubtedly. That is evident from what I say as to the recommendations of the Land Board. They take the man with experience and a reasonable amount of capital rather than the man with no experience and well endowed with capital. In fact, some of these applications—the 292 which were submitted under section 11 during 1913—were refused on the ground that the applicants had sufficient money of their own to acquire land for themselves, and they were not in need of assistance from the Government.

291. In your statement you say some applications were abandoned; what do you mean by saying some were abandoned?—The applications were withdrawn. The figures also include a proportion of applications that were approved, but in respect of which the applicants were not in a position to deposit the one-fifth cash. The figures given under "approved" on page 10 of the statement* I submitted refer only to those cases where the applicants deposited one-fifth cash, and where the purchase of the land had actually been completed. I have not said anything about the number of approvals given by the Land Board where the applicants were subsequently unable to deposit one-fifth of the purchase price, or where transfer of the land could not be given owing to various difficulties that have arisen.

292. That does not mean, then, that the people withdrew from the bargain because they could get better terms elsewhere?—No.

293. They are satisfied with the terms Government offer?—None of the obstacles were because the people thought the conditions under the Land Settlement Act were unsatisfactory. Most of them were due to the fact that the applicants could not put up the one-fifth cash, and some because we could not take transfer, the land being burdened with onerous servitudes.

294. Do you think the retention of the mineral rights by the Government has anything to do with holding the people back?—I think that under section 11 it has to do with the small number of applications submitted. What the applicants do not like is that they should contribute one-fifth of the purchase price, and after paying off the balance of four-fifths with interest at 4 per cent. get transfer of the land *ex* minerals. They say the minerals should not be a perquisite of the Government. They have refunded the whole of the cost price to the Government plus interest at 4 per cent.

295. Which included both prairie value and mineral value in the price paid?—Yes. Of course, we have no means of ascertaining the value of the minerals. The Board inspects the land applied for and estimates its agricultural value only.

296. Do you not think it would facilitate settlement if the Government withdrew that obnoxious provision?—Yes, I have urged that applicants under section 11 be given full rights when they get their Crown grant, and I believe the matter will be favourably considered.

297. Generally speaking, do you think from your experience that the system adopted by the Government in regard to land settlement will lead to success in future?—I think so. In my opinion the system adopted is the best means of encouraging land settlement.

298. You cannot suggest in any way how it could be altered in order to make it more successful?—No. I do not want to express any views on the merits of compulsory expropriation. That is a matter, I think, largely of policy, on which I as an official would rather not express any views.

299. **(Sir Alfred Bateman.)** In regard to the amount of land for disposal you are badly provided with statistics?—Yes.

300. Is that being remedied?—Yes, we are slowly endeavouring to straighten out the difficulties with which we were faced at Union. It is a matter of extreme difficulty to compile statistics of any kind in relation to land except in regard to current operations.

301. Have you statistics of current operations? Have you now agricultural statistics of areas?—When I say current operations, I mean under the Crown Land Disposal Acts.

302. In time you will have proper statistics?—Yes, I think so. We shall bring the matter up to date, I think, in course of time.

303. We have had an estimate, I think, from more than one witness, that about 5 per cent. of the total area of South Africa is land that could be brought under cultivation?—I am not in a position to speak from personal knowledge, but judging from information I have, and taking the average of the arable land we have for disposal, I should think that 5 per cent. is about correct.

304. That makes it about 16,000,000 acres, if you take the whole area of the Union. When you have done all, there will be only 16,000,000 acres to cultivate, independent of grazing?—I should like to make it clear that the 5 per cent. I would stipulate for includes land from which you might obtain a crop, say, once in five or ten years. There is a good deal of land on which you could get a crop if you had a sufficient rainfall. I think that is bound up in the question of having a soil survey of the Union, which is a matter of very great importance and urgency.

305. Is that likely to be done, do you think?—I cannot say. I think it would fall under the Agricultural Department.

306. Sir Jan Langerman asked you about section 11, and the effect of withholding mineral rights. Has any estimate been made as to the further price the Government would require if they gave the minerals in?—No. May I explain that section 11 does not

* *See* p. 12 of this Vol.

quite connect with the question you are putting, because that section deals with land acquired by the Government at the instance of individuals and in respect of which full rights are acquired. These individuals put up one-fifth of the price. I do not think the Government has retained the minerals in terms of the Act because of any value they place on them. I believe that the Select Committee which dealt with this matter thought that it would prevent speculation in land on account of the minerals. I do not think there is much in that, because the land that we are acquiring under section 11 is agricultural land pure and simple.

307. So it is difficult to put a value on that in this country. In England, in the midland counties, where coal is obtained, about 5*l.* an acre is about the price paid for possible minerals on the land as shown by recent sales. But you could not say in this case if, say, 1*l.* a morgen, should be allowed?—No. Under Crown Colony Government in the Transvaal when ground was acquired for these Imperial settlers the Government deducted one-tenth of the cost price when they re-allotted the land, the one-tenth being the estimated value of the mineral rights. But that is not done under Union. The Act lays down that when we buy land under section 10 for general settlement purposes with the ultimate object of sub-dividing it for the purpose of giving it out to settlers, the mineral rights belong to the Crown. The Act also says that the allotment price of the land shall not be less than the cost price to the Government, so that in that instance the whole of our purchase price is recovered, and as a perquisite the State takes the minerals.

308. I gather that, as a rule, they are not worth much?—I do not think they are, generally speaking, but one never knows.

309. I take it that, with the well-known sporting instinct in most people, they would rather like to have the chance?—Yes. The matter is capable of solution. The Government can, assuming it grants the mineral rights with the land allotted for settlement, define the State's share in the minerals, as in the case of diamonds, where, in the Transvaal, the share of the Crown is 60 per cent.

310. But the man would not be willing to give 60 per cent., would he?—No, not where he pays the full purchase price.

311. **(Mr. Campbell.)** Were there any compulsory provisions in the Act of 1912?—No. We have been accused of doing nothing, but I would say that whenever we see land advertised in the newspapers we locate it on the plans. We more or less have information on the plans to indicate whether the land is worth making further inquiries about. If it is worth following up, we have the land inspected. If it is deemed suitable for land settlement purposes we fix a price which we think we ought to give for the land, and generally one of our representatives attends the sale. Nobody knows who he is, and we endeavour to buy the property. Not only that, but we have requested the magistrates to let us know when they hear of land suitable for settlement being offered for sale in their districts, and to give us full particulars, so that the matter may be investigated. Apart from that, we have also written to large landowners, asking them whether they are prepared to dispose of their property. But I must say our efforts have not met with great success, as witness the small amount of land we have acquired in fifteen months.

312. Where you have bought land, have you disposed of all that land. Has it been all re-allotted?—All, with the exception of five holdings at present in the Gazette, and which I feel sure we shall have hundreds of applications for. May I mention that one of the conditions which the Board has to investigate when they are considering the purchase of land is whether there is any public demand for it. Before they make their recommendation they have to consider that point, so I think it is unlikely, with the care that the Boards have taken hitherto, that we shall acquire land that cannot be disposed of. Still, at the same time, suppose we bought, say, 20,000 morgen in one block, it is not unlikely that we should get odd lots here and there which we could not dispose of—probably the tops of hills, or land very rough and broken in character. Such lots would doubtless have to be included in adjoining holdings.

313. Have you any provisions for preventing the land reverting again to large holdings, other than the non-issue of the certificate within ten years?—No, but it would be a long process.

314. In ten years the allottee can re-sell?—Yes, there is no restriction after he gets the grant as to what he should do with the land.

315. I notice that in regard to land that has been purchased under the Act of 1912, the average price per acre would work out at about 30*s.* for 1913 and 15*s.* for 1912: is that so?—Yes, approximately.

316. Does that include any very good land, or has the land that has been purchased been of an average quality?—The land purchased has been of average quality. I can give particulars as to the average price of the land per morgen in each Province applied for and purchased, *i.e.*, under section 11 of the Land Settlement Act. In the Transvaal, the land applied for was of an average value of 2*l.* 18*s.* 9*d.* and the land purchased was 3*l.* 0*s.* 4*d.*

317. That is thirty shillings an acre?—Yes. In the Free State, the land applied for was 3*l.* 15*s.* 9*d.* and the land purchased was 4*l.* 7*s.* 5*d.* In Natal the price per acre as applied for was 2*l.* 4*s.* 0*d.* and the land purchased was also 2*l.* 4*s.* 0*d.* In the Cape Colony, the land applied for was 1*l.* 13*s.* 10*d.* per morgen and the land purchased 1*l.* The lowest and highest prices of land actually purchased in the Transvaal was 13*s.* and 61*l.* 11*s.* per morgen. The latter purchase represented seven morgen of irrigable land, with grazing rights attached thereto.

318. The Government does not go in extensively for the purchase of good land, then? For instance, we understand that land in the Oudtshoorn district fetches 100*l.* an acre?—No. We have had no propositions of that character. The lowest price in Natal per acre was 25*s.* and the highest price paid 3*l.* 13*s.* The lowest price in the Cape was 1*l.* per morgen; in the Free State the lowest was 32*s.* 6*d.* per morgen and the highest price 6*l.* 6*s.* The Free State, as I think the witness that follows me will be able to testify, contains some of the best land in the Union for dry farming.

319. **(Mr. Sinclair.)** You have given us a sketch of your land legislation, which would seem to be very up-to-date. There is provision for acquiring land, provision for helping the individual, you have provision for security of tenure and for the limitation of area?—Yes.

320. With all that favourable legislation, if there is no eagerness, as I gather is the position, for settlement now, what do you suggest is the cause?—No, I do not admit that there is no eagerness. I say there is eagerness. The fact that we had 292 applications last year under section 11 of the Land Act indicates that there is a desire on the part of the public to acquire land for agricultural purposes. I anticipate a much larger number of applications this year than last.

321. Is the desire for first-class land, or for the class of land that is still left to the State?—The desire is for first-class land.

322. Is there any large extent of first-class land left in the hands of the State?—No. I should like to qualify that by saying that you may have exceptionally good land on which you cannot live on account of malaria. What you mean is available land suitable for settlement.

323. Yes. Is the available first-class land now held in private hands so held because they do not want to sell or because they want higher prices?—I should think a combination of the two would just about represent the position.

324. Then you cannot have extensive settlement on the part of those who are looking for first-class land unless you can make that land available?—That is so.

325. Does not that suggest that the requisite for future settlement of first-class land must be the compulsory taking over of it by the State?—On that point, I hope you will not press me to offer an opinion.

326. Until that land can be acquired by the State there cannot be much settlement on it, can there?—No, although certain owners are dealing with their land for settlement purposes.

327. The supply is not equal to the demand?—No, not equal to the demand by persons resident in the Union. An effort is being made by certain private owners of land to meet some of the demand. I understand a company was formed recently in Johannesburg which acquired a farm on the Sundays River, Cape, for the purpose of establishing a settlement thereon.

328. There is some, but it is small?—Yes, it is limited.

329. And the prospects of those outside the Union who may want to come here for settlement are not bright?—I think that land can be acquired, but possibly the prices asked would be fairly high. I do not think there is any difficulty in acquiring land, provided a man is prepared to pay the market price therefor.

Senator Colonel the Hon. John Joseph Byron, C.M.G., called and examined.

330. **(Chairman.)** I think you have had a wide experience of the subject on which Mr. Hughes has given evidence?—Well, I have taken a great interest in this matter in South Africa during the last ten years.

331. You have heard the evidence, and perhaps you would like to supplement it?—I have not come prepared with any extensive figures and statistics, but perhaps I may just sketch some of the circumstances affecting land settlement in South Africa, as I think this may possibly assist you. To begin with, the whole question of settlement in this country has, up to the present, been overshadowed by minerals. I may explain that originally all the railway main lines in South Africa were constructed with one object only, and that was simply as the routes to the goldfields and diamond fields, irrespective of the quality of the land that they passed through. That, I take it, has not been the case in any other new country to the same extent, at all events, as here, and unfortunately these main lines seem to have passed through some of the most barren and forbidding portions of the country, so that general attention was not directed to the agricultural resources of the country as might have been the case under different circumstances. Then, too, the development of the gold and diamond fields had the direct result of taking away a good deal of interest from agricultural and pastoral pursuits. At one time it was no exaggeration to say that practically the whole of the rural population was engaged in mining or in transport riding to the gold and diamond fields, or getting fuel, storekeeping, or doing anything except developing the country's agricultural resources. So that up to the present those circumstances have largely affected land settlement here, and will account to some extent for the backward state in which the country is now from that point of view. Then also, even in regard to the settlements under Crown Colony Government, although very successful, I think it must be admitted that originally they were more or less designed from an Imperial point of view. It was immediately after the war, and it was considered desirable that the population in the newly-acquired territories should be mixed with settlers from oversea, and I may say this, that it has had the best results in every respect, economically, socially, and otherwise. But I think the prime intention was not so much successful land settlement *qua* settlement, but matters of very high Imperial politics. So, in short, I will put it this way: the development of the permanent agricultural resources of this country has not received adequate attention in the past, and up to the present public opinion has not been sufficiently behind the movement in order to attain the results attained elsewhere; and then, no prominent man in this country has hitherto devoted the whole of his brains and his energy to this subject. Am I right in saying that Sir John McKenzie in New Zealand had a profound influence on settlement there? and I daresay that if settlement in other parts of the world could be investigated you would find that a prominent man had led the movement in each case. Now, we have suffered so far in not having had a man who devoted the whole of his time, his energy, and enthusiasm, and, may I add, patriotism, to that particular branch. Those are broadly the salient matters affecting land settlement at present, and they are affecting it at the present day. I think that may be deduced from the evidence of the last witness. We know, too, there has been no soil survey of the country up to the present. The country has not been thoroughly prospected from an agricultural point of view, though it has to a large extent from a mineral point of view, and we have no idea what our resources are. We may form too optimistic a view or too pessimistic a view, but we lack exact knowledge on the subject. For instance, it is only, I think, within the last year or two that it has been discovered that some of the Karroo soil in the river beds is the richest in the world by analysis. Naturally, that came as a surprise to many people, and therefore those who are inclined to be optimistic about the matter think there is a very great future for settlement in portions of this country which are as yet, if not unexplored, unexamined and unsurveyed from an agricultural standpoint.

332. **(Mr. Lorimer.)** I see the whole of the land operations in the Union are now conducted under the Act of 1912?—I do not think that is quite correct. I think the Act of 1912 is supplementary to other existing legislation.

333. But the settlements under the old Provincial Acts remain; they are not altered in any way?—No.

334. I should like to ask whether the policy of the Government in respect to land settlement favours freehold or leasehold tenure?—The whole instinct of the people of this country is towards freehold.

335. And in that case is there any reservation, any power of resumption in the case of land which may be declared by the Land Board or other competent authority to be likely to prove ultimately of great public value?—There are no powers of expropriation of land for land settlement purposes as far as I understand.

336. Does the law as it works now tend to prevent the aggregation of large tracts of land in one pair of hands?—No.

337. Then there is nothing to hinder a farmer, after he has paid up his instalments, or if he can get the sanction of the Minister while paying up, to sell to any man round about him who may want to get large tracts?—I understand he cannot dispose of the land for ten years.

338. After paying the final instalment?—Speaking generally, I understand he cannot dispose of the land until he has been in occupation for ten years. He does not get transfer himself till then. After he has got transfer, no matter how, he is the owner, and there is nothing to prevent him selling.

339. I noticed in the memorandum of the last witness that when land is sold or settled the minerals are reserved, but is that while the instalments are being paid up or in perpetuity?—Yes.

340. Those will remain for all time the property of the Government?—Yes.

341. **(Mr. Tatlow.)** Does the whole value of the minerals remain the property of the Government, or does the tenant enjoy anything at all?—I understand the Government retains the whole property in the minerals.

342. **(Sir Alfred Bateman.)** Are you in favour of that?—I think it has the effect of checking settlement. I prefer to see the restriction removed, because the mineral value is very speculative, and, as you have suggested, the sporting instincts of human nature have to be considered.

343. **(Mr. Sinclair.)** Take the outsider with a reasonable amount of capital. I think your study of the existing conditions makes you believe that there is for such a one a good opening, and the prospect of making

Cape Town, 6 March 1914.] Senator Col. the Hon. J. J. Byron, C.M.G.
[*Migration, Land Settlement, and Irrigation.*

a comfortable home in the Union?—Well, if I may so put it, capital consists, in my opinion, of many things, of which cash is the least important. That is to say, it is possible for a settler to succeed without any cash if he possesses health, energy, and character, including such qualities as aptitude for the life, determination and grit, and, above all, some business capacity. But without these qualities it is impossible to succeed, even with cash. Some of the most successful settlers in this country now are men who had very little cash and no previous experience whatever of farming. I got a list the other day from a representative of one of these land companies. I asked him if he would go through his books specially and give instances of successful settlers who had no previous knowledge. He did so, and gave instances of many men who are now recognised authorities on such subjects as sheep-farming, dairy cattle, fruit culture, sugar cultivation, and so on, who acquired this knowledge somewhat late in life, and there are many instances of people who have been bred and born to farm work, but who have not taken the trouble to make themselves up-to-date on agricultural matters, and who have been the most abject failures as agriculturists. But the man who has business experience, health and energy, plus a little capital, will be almost bound to succeed.

344. **(Chairman.)** What do you want done which is not being done, in order to be more successful in settlement?—We want a soil survey and a water survey. We want public opinion to be educated to the true wealth of this country, which is not minerals. And, in fact, we want a large and defined public policy towards making ground available and ready for land settlement, which will only come when the people generally are educated up to it.

345. Is not that somewhat rather vague as a policy of land settlement? Cannot you be more precise?—I think, first of all, a soil survey is essential. In this respect we have never taken stock of the location and extent of the national assets. With that, we must have such information as to the size of farms, the productive capacity, the facilities for market, and so on, that will enable us to put settlers on the land with confidence. We then require to pass such legislation as will make that land available for settlement. I look on the construction of railways as a most important factor in regard to land settlement schemes, and in this we are rather behind. If we take the experience of other countries and study it and adapt it, there is no more difficulty in settling people on the land here than in carrying on any other great national work. You will always have your percentage of failures, but we can reduce this percentage very considerably by care in the selection of land, as to size, situation, fertility, and price, and in the selection of the settlers.

346. Would you care to say anything about irrigation and railway construction?—Yes, I think our railway policy now should have some bearing on agricultural development and land settlement. Our mining and coalfields are now sufficiently well connected up to the coast, and in future the aim should be to construct lines more with a view to land settlement. I need not go into details.

347. Have you any desiderata regarding irrigation outside of the policy now being pursued?—I would rather not speak of it. I do not live in an irrigation district, and I have concentrated my attention more on the dry land farming aspect.

348. Are there any other points?—I think there is a great deal of suitable land in the Union as regards the fertility of the soil. People are notoriously kept away from some of the most valuable land by the bogey of malaria, but on this question I would quote an interview with General Gorgas, from Panama, who is now in this country, and he has summed the matter up by saying that the settler in the malarious districts of the Transvaal where the land is good has less trouble in protecting himself from malaria than the settler in Dakota or Manitoba has in protecting himself from the cold. So that at once opens up a vista of almost unlimited settlement in these fertile districts. As regards the size of the holdings, I would point out first of all how backward we have been here and are still. I may say, as a matter of fact, that seven years ago, in the most progressive part of the Union, which happens to be the part I come from myself, such a thing as winter feeding was comparatively unknown. Ensilage was unknown, and rye—I can well remember when it was first planted—the majority of the farmers had never seen such a plant. But it is now very rare that you will find a farmer who is not well provided with winter feed. You will now find green fields of rye growing where formerly there were brown plains, and in this way provision is made for the sustenance of sheep in the winter season. These facts will tend to explain why people in the past considered that they must have enormous areas on which to feed their stock, so that having grazed out one portion they could send their animals to another. And little or no action was taken, owing to the size of the farms, to insure against a bad season and consequent loss of stock by developing or cultivating a portion to provide winter feed. But it is also being proved that the smaller the farm the greater the insurance against total loss. As a man cultivates his farm better he will not allow the moisture to escape from the ground as before, and if he does meet with a shortage of rainfall sometimes he will not come to utter ruin as in the past. This is only possible by reducing the size of the farm. He will supplement nature by cultivation.

349. **(Sir Alfred Bateman.)** Where is this district you are speaking of?—I am speaking of what is known as the conquered territory in the east of the Free State along the Basutoland border. As you approach the mountians there is rich fertile land averaging almost 30 inches of rainfall per annum. In this district the farms are becoming smaller and smaller.

Port Elizabeth, Friday, 13th March 1914.

Mr. Charles Huskisson Mackay, President of the Port Elizabeth Agricultural Society, called and examined.

350. **(Chairman.)** You appear to give evidence with Mr. Oscar Evans*?—Yes.

351. The heads under which you will give evidence are irrigation, agriculture, and pastoral development?—Yes, I do not know exactly in what form the Commission would prefer me to give my evidence.

352. The larger possibilities of development; minor things we need not trouble you about?—First of all, I would start with the Humansdorp district, in which the Gamtoos River is situated. At present there are four schemes being constructed there, four weirs across the river called the Cougha and Gamtoos River, the Rademeyer scheme and the Pateintre, which will probably bring about 9,000 morgen of rich virgin soil under irrigation. In the past this valley has been developed to a great extent, but all by pumping. By means of these weirs, however, they will now be able to irrigate this immense tract of country by gravitation. I then go to the Cradock district. This is an area which has undergone an immense amount of development in the last few years. First of all we come to the Tarka Bridge scheme, which has already put 1,800 morgen of virgin soil under irrigation, and then a little lower down, on the Fish River, below Cradock, to the Mortimer scheme, which includes four weirs at different places across the Fish River. One is called Marlow, bringing 1,917 morgen under irrigation, the Scanlan with 2,518 morgen, the Lime Bank with

* For the evidence of Mr. Oscar Evans, *see* p. 24.

1,789 morgen, and the Drennan scheme with 1,729 morgen. Then a little lower down below those schemes is one called the Baroda scheme, with 4,500 morgen under water. These are the large developments in the Cradock district, but there is also a quantity of work which has been done by private enterprise by farmers putting their own weirs across the rivers, bringing large tracts of country under irrigation which before was simply Karroo veldt, and now it is producing lucerne and different kinds of produce. Not only are they doing this by the construction of these weirs in the district, but they are stopping a great deal of water that formerly ran to waste. They are surveying it and they are bringing it over the Karroo, and irrigating the land by this means, and so protecting themselves from drought. I know of one instance out of many showing what the result of this lucerne-growing has been and what benefit it has been to the country. During recent years we have had a very severe drought, but there was practically only a small amount of stock lost in consequence of the drought, on account of farmers in that area having large quantities of lucerne hay put away. In that way they were able to save their stock, whereas formerly they lost a good deal.

353. What is the difference in the value of the land before and after these works have been carried out?—Mr. Evans might probably give you that better than I can, but in the olden days you could buy for possibly 2*l.* a morgen land which to-day you could not buy for 50*l.* Then we come to the Bedford district. There they have the Vitmoss scheme, which puts about 5,000 morgen of land under water, and a little lower down, in the Somerset East district, we have the Long Hope scheme putting about 5,400 morgen under water. That is as far as I can go in the Somerset East district, but in both Somerset East and Bedford there are these private schemes to which I have already referred carried out by the farmers themselves. Now, coming to the Sundays River, we have three schemes starting from Bayville.

354. **(Sir Rider Haggard.)** Is that Sundays River in this district?—Yes, not far from here. There is the Bayville scheme, the Cleveland scheme, and the Selborne scheme, and then further up than that you have the farmers who have constructed large weirs of their own. For instance, there is a gentleman just below Graaf Reinet, Mr. Olivier by name. He has put a huge weir or embankment across some ravines at a cost of 90,000*l.*, and by that means placed an immense tract of country under water; so you have these works going on right away up into the middle of the Karroo, which used to be at one time absolutely barren and is to-day growing lucerne. These are small schemes of private enterprise undertaken by many of the farmers themselves. Then, again, we come to the Longkloof, a very productive district well supplied with water, but in the past having no means of bringing that produce to market. Now, owing to a light railway having been constructed, the fruit that used to come by bullock-wagon in the olden days to this market, probably arriving in a state of pulp, to-day not only comes to Port Elizabeth market, but is shipped in fairly large quantities across the water all packed in up-to-date boxes, as fruit should be packed. That is the effect of a small light railway. Then another great development that has taken place in the Eastern Province is the growing of citrus fruit, especially in the Lower Albany district. They are now growing magnificent oranges that are being shipped oversea and fetching very good prices on the London market. They are also going in largely in that district for apples, and I noticed only this morning in the paper that there had been a very fine exhibit of apples grown in the Lower Albany district at the Grahamstown Show yesterday. In the olden days this was quite unknown. That is all I have to say on that subject, but I shall be pleased to answer any questions you may desire to ask me.

355. **(Sir Alfred Bateman.)** Who made the light railway, did the Government make it?—Yes, it was a development line.

356. And did the Government help with the irrigation?—Most of the irrigation schemes have been undertaken by means of irrigation boards, the farmers joining together and forming a board, and the Government advancing the necessary money at a low rate of interest.

357. Could you give us any estimate of the acreage that has been added to cultivation by means of these irrigation schemes in the last five years?—That would be very difficult to do.

358. **(Mr. Campbell.)** Where farmers carry out these private schemes, do they have to get any authority from the Government, or have they full rights to block up the stream and irrigate their land?—I do not think the Government has anything to do with it, they have to agree with their neighbours. You will understand that this matter of blocking up the rivers has probably caused more litigation in this country than any other question.

359. Is that litigation still going on?—No, under the recent Irrigation Bill passed by the Government, and through the farmers agreeing among themselves right along the river, that difficulty has been done away with to a certain extent.

360. In regard to this land which is reclaimed by irrigation, is there much room for extension of the system throughout this district? Would these irrigation schemes be able practically to cover the whole district, or is there only a limited area?—There are certain areas that you could never irrigate, such as the mountain lands and the stony ground, but these schemes which I have spoken about are principally on the banks of the river, where there is virgin soil deposited in years gone by.

361. Could you give us any idea as to the average cost of the land when put into a condition for irrigation, that is, the original cost of the land before the works were started, and the cost per morgen of putting down the irrigation works. Have you any idea?—No. I cannot say, it varies tremendously. To clean an ordinary piece of land to level it up for lucerne, would possibly cost 10*l.*, and that ground would probably cost 1*l.* 10*s.* to 3*l.* a morgen, but, of course, the total cost would depend on the cost of the weir and furrow.

362. That was not the cost I asked for. The cost I want is the original cost of the land unimproved by irrigation, and then the cost of putting down those works for the purpose of irrigation. Those figures must be kept somewhere, I should think. Nobody enters on a scheme without looking at the cost very carefully?—Well, I do not happen to know that figure. Of course, in some places these weirs are very primitive affairs.

363. Earth banks?—Yes, with stones packed up. Quite a lot of country near Port Elizabeth has been brought under cultivation by that means. Mr. Holland is here, and he himself has thrown a primitive bank across the river. By that means he has developed it, and brought a most valuable quantity of land under irrigation. There are many other schemes in the country of the same kind.

364. **(Sir Rider Haggard.)** Is the position this, that in this part of South Africa, as in many others, there is an enormous stretch of land which is not valueless, but which can only support a small proportion of stock, and there is a small area of land which can be brought or has been brought under irrigation?—Yes.

365. And is it the case that really the welfare of the country, the agricultural welfare, depends for the future on irrigation?—Yes, I have considered that, and I may say that up to the present it has been the salvation of the country wherever they have made irrigation works. Whenever we get droughts the farmers can now save their stock, which in the olden days would have died, practically to the last one, if they had only to depend on the ordinary rains of the country.

366. Would it be too much to say that the agricultural advance of the country during the last thirty years can be put down to irrigation?—I would not go back thirty years, I would say during the last ten years even there has been a wonderful development, but at the same time there is room for much more.

367. And the agricultural future of the country depends upon the increase of the irrigated areas?—Yes. I would say it depends on the conservation of water a great deal. If we can conserve a small portion of the water by means of these weirs we can transform a great quantity of this country into splendid land.

368. Is it not the case that even with your schemes already in action the vast majority of the water runs to waste?—Yes, a long way.

369. And that, therefore, whatever you have irrigated up to the present could be at least doubled if the water were stored?—Yes, more than doubled.

370. Probably quadrupled?—Yes, that is my opinion.

371. If that is the case, would not such doubling or quadrupling mean a vast increase in the prosperity of this part of South Africa?—Absolutely.

372. These facts are realised, are they not, by the farming community?—I think so, and wherever a man has an opportunity of putting a weir across these small rivers he tries to do so, whereas before he never thought of it.

373. Are the Farmers' Association pressing that point of view on the Government and taking corporate action towards that end?—I could not say that has been done by any other bodies than the Farming Association.

374. Are the Farming Association doing it?—Yes.

275. Is the Government contemplating any help in the matter of these schemes?—Only by means of the new Irrigation Act which they have passed, under which a certain number of farmers can form themselves into a body. The Government advances the money at a low rate of interest, repayable in a certain time.

376. Will they do that to any extent?—So far as I know it is unlimited.

377. Therefore, it seems that the matter lies in the hands of the farmers themselves to bring forward schemes, since the Government is ready and willing to give adequate assistance?—I would not like to say that it depends entirely on the farmer; it depends on the Government also to a large extent in this country. There has been a difficulty in the past of getting sufficient hydraulic engineers in this country to carry out the different works. I think Mr. Evans will bear out what I say. There are many schemes which have had to be left, because the Government have not had engineers who could survey these schemes and report on them.

378. Then the only stumbling-block in the way is the lack of competent hydraulic engineers?—Well, I should say that has a lot to do with it, because, take any kind of scheme, there are schemes upon the Vaal River and the Orange River that the engineers cannot cope with.

379. Suppose this was done, that all this land was brought under irrigation, are there sufficient people to occupy it?—I should say no, we want more population of the proper sort in this country.

380. What do you mean by the proper sort?—The farmer class.

381. It would be of no use having irrigable land if there are not sufficient agricultural people to put on to that land and to turn it to account?—No.

382. Therefore, irrigation must in one sense depend on population just as population must depend on irrigation?—I would not say that entirely, because we have a great many people who could do very much for themselves and for the country if they could only be made to work. There are plenty of them here already, but, unfortunately, they will not work.

383. Do you mean to say that you have people here who have wealth before them such as you describe but are not willing to work so as to put that wealth into their pockets?—There are some of that kind.

384. You mean a thoroughly idle class?—Yes.

385. Lucerne is a good crop under cultivation, is it not?—Yes.

386. It is a perfect godsend to the country?—Yes, and if we grew ten times as much as we grow now it would still be one of the most valuable crops that we could possibly have.

387. And this could be done, you say, by irrigation?—Yes.

388. Is it the most profitable crop?—There is nothing pays better than a crop of lucerne. You can get from four to six crops of lucerne in a year, whereas with maize, or anything else, you can only get one crop.

389. Are there any schemes afloat to put poor whites on the land with the help of Government money?—I only know of one poor white settlement in this country, and that is the Kakamas on the Orange River, which is controlled by the Dutch Reformed Church.

390. How is it doing?—I believe splendidly.

391. Are the people getting on?—Yes.

392. And so I suppose that is a good augury for the future of such schemes?—Yes.

393. Would this land grow fruit if it were irrigated?—Yes.

394. What sort of a market is there for fruit? Suppose you grow the finest quality of Californian oranges, Navels, could you dispose of the fruit?—Not locally, but England provides a good market.

395. Therefore, I should be right in concluding from what you say that there would be a very much enhanced prospect for this country if only its available waters were turned to account?—Yes.

396. **(Mr. Sinclair.)** Have the larger schemes of which you have spoken been undertaken by combinations of settlers or by irrigation trusts?—No, simply by the farmers through whose lands the rivers run forming themselves into an irrigation board. The Government then sends an engineer to report on the scheme, and if they see it is a feasible scheme they advance the farmers the money needed.

397. After a scheme has been projected and inquired into and reported on, the Government lend the money if it is satisfied?—Quite so.

398. Is the loan interminable, or do the rates include a sinking fund?—They have a sinking fund, and it is paid off in so many years.

399. Have you any idea of the approximate amount of capital that has been advanced by the Government for these purposes?—No.

400. It would be a very large sum, I suppose?—Yes.

401. And in addition to that there has been individual private expenditure?—A great amount.

402. You cannot tell us how much?—No.

403. But altogether the need for irrigation has resulted in very large funds being provided for the purpose, as so much of the prosperity of the country depends on it?—Quite so.

404. As to the land that will from time to time be available, do you think that there is room for the outsider—for the arrival in the Union of settlers from other parts of the Empire? Is there room for them to take up land? Will there be room under the schemes you have in view?—Yes, immense possibilities; there should be homes for hundreds and thousands of settlers.

405. I wanted to get your opinion as to the opportunities and prospects for outsiders coming into the Union and settling on the land?—Yes, if the irrigation works are carried out on a larger scale.

406. And they are being carried out?—Yes, for instance, one syndicate alone—the Smartt Syndicate—has put an embankment across two ravines and brought I do not know how many thousands of morgen under irrigation. That is private enterprise.

407. Are they bringing in settlers?—Yes.

408. That is a part of their scheme—to reclaim the land and bring in settlers?—I do not mean to say that they are actually importing people from over the water, but they are getting these people to come and settle on the land—those who are willing to work. But there is a large class of white men in this country who will not work.

409. You have them already. I was rather thinking of the opportunities for outsiders, and you think there are large opportunities for them to come in and take up land?—Yes.

410. Will those lands when reclaimed be suitable for mixed farming, as well as for growing lucerne?—Yes, they can grow anything on this land.

411. They will be suitable for general farming—is that so?—Well, of course, it depends on what you call general farming. If a man wanted to keep a herd of cattle on a small piece of ground it would be impossible.

412. But he can grow a little wheat and tobacco, and keep a few ostriches, can he not?—Yes, also potatoes and fruit.

413. And grow lucerne for seed, if he cannot utilise the ground for ostrich farming?—You would want a good piece of land to grow lucerne for seed, because if you are going to let your lucerne run to seed, you are not going to get five or six crops a year from it.

414. Has not ostrich farming in the past really diverted attention from what I would call mixed farming?—Yes, there is no doubt about it in my mind, but it has paid so well that you could hardly blame the farmer for going into it. It has prevented what one might call general all-round farming.

415. General all-round farming is a source of wealth to the Union which has not yet been tapped?—Yes.

416. You have been rearing ostriches instead?—Yes.

417. **(Sir Jan Langerman.)** Yesterday, in the train, we came through about 150 miles of country which did not seem to be put to any use at all?—Do you mean the coastal belt?

418. We travelled through an immense extent of land where there did not appear to be any habitation or animals. Cannot that land be utilised?—Yes, and since the farmers on the coastal belt have found out the advantage of dipping their cattle, these coastal farms have become very valuable. Although you did not see the homesteads there are some very fine farms in that area. And that is one of the complaints we have to make at present, that sufficient attention is not paid by the Government to this coastal belt, which is very valuable, because the rainfall is so regular. We have been urging on the Government for some years to give us experimental stations along the coast belt the same as at other places. There is no reason why this country along here should not grow anything you wish. I do not mean these sour pieces. But, even there, one of our merchants here has bought a tract of that land and manured it and planted it with grasses, and he has now a very fine lot of grasses established. There is no reason why these farms, if they had manure, should not grow plenty of stuff.

419. That is in the lower part here?—Yes.

420. But higher up, between this and Uitenhage, I mean?—Did you not see a very fine farm, belonging to Mr. Holland?

421. We traversed about ten thousand square miles without seeing any farms?—Yes, but the reason for that is that a good portion of this land is in the hands of companies and they are not developing it. They have let one farm, which is being worked, but the rest of the country is not being utilised.

422. The country seems to be waterless—as regards surface water?—They have a river running along the railway.

423. But you can only make use of that for about half a mile on each side?—I should say that the whole of that country, if there were a large weir constructed up above Uitenhage, every inch of that ground till you get to Redhouse will grow anything you like. It is all beautiful red soil, and if the bush were cleared off there is no reason why the whole of that area should not be under irrigation.

424. I noticed it was a good red soil and of good depth?—Yes.

425. I was wondering why it was not brought under cultivation?—The farmer I referred to was Mr. Holland, who is present here this morning. His farm was exactly the same kind of bush land that you came through, but being an energetic man and having the wherewithal to do it, he has cleared his farm, and I suppose it is worth ten, twenty, or fifty times as much to-day as when he got it.

426. What do you think the Government ought to do in the matter to open the ground for cultivation? Because, I take it, it is private land?—Yes, it is private, and some belongs to the company. I do not know what the Government could do in a case like that. But I should say the whole of that land could be made most valuable and support a large number of people if they had a weir above Uitenhage.

427. Then the only remedy to bring it under cultivation would be to tax the owners heavily?—I would not like to say that, sir.

428. **(Mr. Garnett.)** I gather from your remarks that by irrigating these areas you hope to induce closer settlement on the land?—Yes.

429. Would you say what size of holding you think suitable?—No, I would not care to say that.

430. You have laid great stress on the need for suitable people, and I suppose that one requirement is willingness to work?—Yes, that is the first essential.

431. Is it necessary, also, that the man should have capital before he can make a start?—Yes, they would have to have some animals for ploughing, and a few cows for milking, and so on.

432. They would either have to have capital in money or in stock?—Yes.

433. You would not be able to say how much capital is necessary, because so much depends on the size of the holding?—Quite so.

434. You mentioned some very large works undertaken by a gentleman who spent 90,000*l.* in erecting a dam?—Yes.

435. Is the water impounded by that dam used solely for his own estate, or does he supply it to his neighbours?—No, it is used for his own purposes.

436. Would he have any right to supply his neighbours?—Yes, he could do what he liked with the water, because it is not a river. He has impounded a flow of water on his own farm.

437. But at present he is only using it for his own purposes?—Yes, as far as I know.

438. **(Mr. Bowring.)** You told us a good deal about the land which is irrigated or irrigable: will you tell us something about the land which is not irrigated—whether there is much expansion in farming on these lands or not?—That would be what is termed in the Transvaal dry farming. Well, along the coastal belt there is an enormous extent of dry farming done. That is growing barley and oats in large quantities with absolutely no irrigation of any sort. But they grow mangold wurzels for feeding ostriches and cattle.

439. And that is quite a large industry?—Yes.

440. Have you an export in those things from Port Elizabeth?—No, we consume it ourselves practically, here or in the country. Since we have had railway communication the farmers have been able to bale their forage and send it in up-to-date style to Johannesburg or wherever it is wanted, whereas formerly they had only this market.

441. There is, I suppose, a demand for all you produce, and I suppose for more if you had it?—Yes, at the price.

442. This dry farming is not increasing very largely, I understand from what you say?—I think it is, because whereas in the olden days there used to be only the father ploughing a certain number of acres, now you have all the sons growing up and they are further developing those lands.

443. All the land in this vicinity, I presume, is taken up by private people or big companies?—Mostly by private farmers. Of course, there are a few Government reserves, which are an absolute curse to their neighbours by allowing vermin to breed.

444. Are these reserves for sale at a cheap rate?—Well, I do not think so. The Government lease some of it, but there is none for sale that I know of.

445. What do they do with these lands?—Breed jackals and vermin to destroy the farmers' crops and stock.

446. It is not open to settlement at all?—No, it is practically all leased to Kaffirs—they hire it out.

447. But not at rates that would induce settlers to come in and take up land?—No, it would not be suitable for settlers, I think.

448. It is not good land?—A great deal is forest reserve.

449. **(Sir Rider Haggard.)** Well, that is a good thing?—Yes.

450. **(Mr. Bowring.)** All the good land, then, being held privately and at a high price, there is not much chance for settlers to come in and develop it as it stands?—I believe there is going to be a large land settlement scheme established near here shortly. That valuable property which has been bought by a Johannesburg syndicate, with which Sir Percy Fitzpatrick is concerned—the Sundays River Settlement Syndicate. That is lower down than Selborne, and I believe they are going in for closer settlement there.

451. On irrigated lands?—Yes.

452. But you do not anticipate any great development or closer settlement on the lands that are not irrigated?—No.

453. The prosperity of this neighbourhood depends almost entirely on irrigation?—Yes. But, understand me, there is any amount of this coastal land that cannot be irrigated because there is no water.

454. What is the prospect of developing that kind of land?—There is no reason why, with the regular rains that we have, these farmers could not go in for dairying and grow a great deal more stuff than they do. There is no reason why they should not grow mangolds and root crops and feed their cattle and go in for dairying and poultry.

455. Dairying has not received much attention so far, I gather?—No, it is in its infancy.

456. And you are importing large quantities?—Yes, and importing eggs to the extent of about 70,000*l.* a year.

457. That, one would imagine, ought to be changed?—Yes, and milk to the extent of 477,000*l.* last year.

458. In the shape of condensed milk?—Yes. Nearly half a million. I took the trouble to extract the figures relating to stuff which you could call the products of the cow, and I found it amounted to over one million. All that we should produce in this country, and at the present time we are importing it. At least, we did last year.

459. It is most extraordinary?—Yes, and it is the kind of thing we talk about at every agricultural show we go to, and urge the farmers to go in for dairying.

460. I suppose you are advancing?—Yes, there have been great strides made, but there is still a lot of room for improvement.

461. **(Mr. Campbell.)** In answer to Sir Jan Langerman, you referred to the land we passed yesterday being in the hands of some company, and not being made use of as it might be. Is there much land in this district in that position, held by private individuals or companies, that might be irrigated and is not?—No, I should say not. That is the exception, I think.

Mr. Oscar Evans, farmer, and a member of the Land Board, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce," see page* 200.)

462. **(Chairman.)** You have heard the evidence of Mr. Mackay. In what way can you supplement it?—Everything that he has said, so far as I have heard, I can corroborate. I do not know that I have much to add.

463. **(Mr. Campbell.)** You have had a good deal to do with the irrigation of land?—Yes.

464. I suppose you think, like Mr. Mackay, that a great deal of your success is dependent on the proper use of irrigation. We have heard elsewhere that there has been an enormous mass of litigation over water rights, in regard to streams, and so on. Probably that litigation has now been settled, and the position is fairly well understood, but can you say whether, as the law stands now, either under the Roman Dutch code or under legislation, the legal position is favourable to the proper development of irrigation?—It is better now.

465. I mean to say, is there any need for alteration by means of legislation in order to facilitate this development?—I can only say that the law is very much more favourable to proper irrigation development now than was the case in the past, because we have had a new Irrigation Act passed three years ago, and since then the chief fillip to irrigation has taken place.

466. That deals, I understand, chiefly with co-operative irrigation by bodies of farmers who combine for rating purposes; is not that the case?—Yes, but it also lays down laws for private individuals.

467. It defines the rights of private persons?—Yes.

468. And you think that the law is now generally satisfactory in regard to irrigation?—I think in regard to present conditions it is satisfactory. Of course, it is a new Act, and if any difficulties crop up they will no doubt be adjusted later on. For the present, however, I fancy it is as good as we can have it. Circumstances occur in a new country which bring about new conditions, and there may be amendments necessary from time to time. But at present I think it is a very good measure, and in favour of the general development of irrigation in the country.

469. **(Sir Jan Langerman.)** You are a member of the Land Board: what are its functions?—There is a membership of five in the Cape Colony. There are five in each Province. We have meetings at Cape Town generally, but we may meet in the Eastern District occasionally, to consider applications made for the sale of land for closer settlement purposes. Also, in the case of any man really deserving of help who applies to the Government with the object of settling himself on a good farm, we consider his application, and then report on it to the Government. On our report depends whether the Government will assist him by buying the farm or not.

470. I gather it is not part of your functions to make a recommendation to the Government supposing you see a large area in a certain district which is capable of development; you do not recommend the Government to take it up?—No.

471. Do you not think it should be a part of your functions to do that and, so to speak, hasten the development of the land?—Yes, I think so, possibly.

472. Because at present the Government knows nothing except when an application comes along?—Yes, but there is a keen desire on the part of most people who have good land to offer it. Probably 90 per cent. of the schemes have to be rejected owing to their not being considered suitable for development. It is not the lack of offers that we have to complain about so much.

473. Mr. Mackay said there were miles and miles of land which could be brought into cultivation. Would it not be to the advantage of the country if the Land Board were to make recommendations in regard to that land so that the Government could take certain steps to facilitate its development?—There is so much of that kind of land all over the country, and I do not think it would be of very much advantage for the Land Board to do that. The Land Board is capable of doing it if they wish, but it is not part of their duty.

474. Do you not think it would be advantageous if the Land Board took that question up and wherever they see an opening for development to make a recommendation to the Government?—I think it is this way—if a member of the Land Board saw there were capabilities of development in this direction he would suggest it to the people round about. He would probably say, "Why did you not offer this to the Government." It would do a great deal of good, no doubt, but I do not think you can expect the Land Board to travel about the country and hunt for these feasible schemes.

475. Not as the Land Board is at present constituted, but I mean to say cannot the Land Board get further powers to enable them to travel round and find out where the country could be opened up. Do you not think that would be a good move?—It is hard to say.

476. Otherwise the country stands still?—Well, you would have to reconstitute the Land Board. At present the idea is this: there is the Land Board and there is the Government ready to buy any lands which are considered by the Land Board to be suitable for these purposes such as closer settlement, or any ordinary individual could come to-morrow and apply to the Land Board to purchase any property on which he sees a chance of doing well for himself, if he is a poor man. I think that anybody who had property capable of closer settlement would be only too anxious to sell it to the Government. It is rather a difficult matter for any individual to carry out such schemes without assistance. It could only be done by a company like this one of Sir Percy Fitzpatrick. In that case they are going to cut up a larger tract of ground, provide water, and put people on the land. The private individual cannot do that, and he would say, "I must offer this to the Government."

477. You think it would occur to a man as a speculation to go to Government?—Yes.

478. There is no machinery to compel a man who locks up his land, or a company which locks up its land, to develop that land?—No, there is no such machinery.

479. Do you not think that is a wrong principle; the country will never make any headway as long as land is locked up in that manner?—I think to a certain extent it would be a good thing if it could be done. I think most of these large companies should be prevented from holding up large tracts of land.

480. Why a company and not a private individual?—I do not think that the private individual is such a great sinner in this respect as the company.

481. Generally speaking, you think there is room for improvement in the constitution of the Land Board in order to facilitate the development of the country?—I would say that it is a matter which requires a good deal of consideration; at the present time the system is working very satisfactorily, as far as I can see.

482. But there is no initiative on the part of the Land Board now?—No.

483. If they could have initiative powers, do you not think it would be good for the country?—It might be, but I do not think it would make very much difference myself.

Mr. Fred. H. Holland, member of the Ostrich Farmers' Association of Middelburg, called and examined.

(*For evidence of this witness on "Animal and Agricultural Produce," see p.* 203.)

The witness made the following statement:—Reference has been made to the basis upon which farmers borrow money from the Government for irrigation schemes. I may mention that there are two kinds of rivers in this country, the perennial stream and the intermittent stream. The former, as regulated by the Irrigation Act, is one that runs for not less than nine months in the year, whereas the intermittent stream is the kind you see all over the country that comes down only in flood. Now it is not permissible to throw a weir across a perennial stream, all these co-operative schemes being confined to the intermittent streams. Whereas, previous to 1906, when our Irrigation Bill was passed, any farmer had the power of blocking a co-operative scheme entirely when he did not consider it advisable in his own interests, to-day he can be compelled to allow a right of way over his land. We are allowed to put a weir in the river even on his land for the benefit of lower owners, suitable compensation being arranged by the Water Board. A further comprehensive Irrigation Act for the whole Union was passed in 1911.

Now, in regard to the subject of dry farming, I have no doubt the members of the Commission have read with interest Dr. McDonald's book entitled "The Conquest of the Desert," and also a rather able paper read by the same gentleman before the Unionist Congress a few weeks ago. I just wanted to mention that, from practical experience, I know that Dr. McDonald's statistics are unduly optimistic. I side with his arguments entirely, but when it comes to statistics, especially those dealing with citrus fruit for export, and the cultivation that might be possible on the banks of the Orange River, I can state that they are wrong. I could draw up a similar prospectus in regard to ostrich farming, for instance, and by a process of multiplication I could show that on a given area of ground it would be possible to produce ten times as much as we do. He proceeds to state that if you plant trees so many feet apart and each tree will yield so much fruit, by multiplying that quantity by so much you get such and such a result. Well, that is not correct.

We were also told just now that there is only one of these poor white settlements in the country, the one at Kakamas. But there is another one near Aliwal North, called the Arbeids Kolonie. There they have a Dutch settlement, also under the ægis of the Dutch Reformed Church, and I saw growing there a comparatively large area of wheat off which they expect to reap 4,000 bags this season. Their water is got through two turbines with a 15-inch delivery pipe from the Orange River, and in time they will be able to extend the area under cultivation very much.

Now we were also told that the absence of competent hydraulic engineers operated against the development of more of these private irrigation schemes, but I disagree with that statement entirely. A few years ago there were only three irrigation engineers working for the Government in the midland circle, controlled from Cradock. To-day there are eleven stationed at Cradock and about eight at Graaf Reinet, which will indicate the increasing assistance extended to farmers. These are all professional surveyors and trained engineers, and I would say that the progress of the country is being retarded very much more by lack of appreciation of the advantages of irrigation on the part of many of the landowners in the country. The advantages are fully recognised in the ostrich farming areas, and I side, in that connection, entirely with Mr. Evans* as regards the advantages that have been reaped from ostrich farming forcing on this development: it is recognised in the midlands, in the Uitenhage District, in Bayville, in Selborne, in Oudtshoorn, and in the Western Province. But on the banks of the Caledon River, for instance, that rises in the Mohuti Mountains in Basutoland and flows into the Orange River near Aliwal North, I have seen great possibilities of development. I have a farm myself on the banks of that river, and I have been doing my level best to persuade the Dutchmen who live around there to go in for a comprehensive scheme. The owner of the land before me got the Government expert from Bloemfontein to report on the possibilities of irrigation, but I understand the scheme, although recommended by him, has been condemned by the other landowners interested, and we have been forced to be content with a suction gas plant which places about 100 morgen of land under irrigation in place of the other scheme bringing about 700 morgen under irrigation on that particular farm. That is only an isolated instance, but it can be multiplied a hundredfold or a thousandfold. Then, of course, it has been recognised by the Irrigation Department that you must have these small educative schemes. Mr. Kanthack, the Director of Irrigation, has given evidence on that point, I believe.† These small schemes that we have throughout the country are fulfilling their duty as educative schemes. The country is not ripe yet for the colossal schemes, but eventually there is no good reason why vast tracts should not be put under irrigation both from the Orange River and the Vaal River, apart from our smaller river schemes.

484. (Sir Jan Langerman.) You referred to Mr. Kanthack. Do you know what his opinion is on the result of his surveys?—I believe he is of opinion that there are considerable possibilities of development there when the country is ripe. It is impossible to do anything until the country is opened up by means of

* *See* pp. 24 and 200. † *See* p. 1.

railways. There must be a comprehensive scheme, and I understand the Government is not prepared to spend sufficient for the purpose.

485. **(Sir Rider Haggard.)** Did you tell us that the conclusions in the "Conquest of the Desert" were unreliable?—No. It is very reliable, but I say Dr. McDonald's statistics about the profits to be derived from citrus culture are unduly optimistic.

486. Where is that area?—Below Kakamas, about 200 miles from Prieska, in the Cape. It is generally called the arid south west.

487. How far from Bloemfontein?—About 36 hours by rail, and then you would have to motor for a day.

488. Is there a large area of soil there?—Almost unlimited, and not only there but all along the banks of the Orange River.

489. What is the value of that land now?—Probably you could get river frontage land there at 8*l.* to 10*l.* per morgen. The land has appreciated very much. Formerly you could have got that land at 10*s.* an acre, but since ostrich farming has been so prosperous, this irrigable land is almost unduly inflated.

490. Is there any railway?—No. Part of Dr. McDonald's scheme is to have an electric railway driven by power derived from the falls on the Orange River.

491. Is it a good climate?—Marvellous.

492. Is it very hot?—Yes, and very dry. The rainfall is only about three or four inches per annum. Nothing is possible without irrigation.

493. Is this place fit for settlement?—Yes.

493*a*. Is it fit for small holdings?—Yes. In fact, there is a settlement already at Kakamas. The whole place is cut up into small settlements.

494. Is the soil very deep there?—Yes, from 30 to 50 feet.

495. Is it suited for all forms of citrus fruit?—Yes, and other fruit.

496. And is it suited for lucerne?—Yes, it does remarkably well; in fact, they have been turning lucerne into seed, and I myself grew some of it last year and found the germinating power to be far superior to the best imported seed.

497. Is any other land there under cultivation?—Very little. I have heard about another scheme at Upington, where the Rev. Schroeder induced poor whites and bastards of the coloured race to go in for irrigation, and I believe it has been very successful, but I should say that not more than 1,000 acres at the outside along the banks are at present used for irrigation besides the settlement at Kakamas. There are isolated islands here and there of about 60 to 100 acres in the centre of the stream which are very suitable for irrigation, and these islands are being largely cultivated, but by comprehensive schemes considerable development could take place.

498. Do you think there are 100,000 acres that can be irrigated?—Yes, along the whole banks of the Orange River and probably more. I should think that Mr. Kanthack, of the Irrigation Department, could give you reliable evidence. They have surveyed most of the banks of the river.

499. You tell us that the price of land is being unduly inflated?—Yes. The difficulty would be to acquire the land. It would have to be brought privately, or expropriated at a fair valuation.

500. It is now in the hands of people who are making no use of it, or speculators holding it over for a rise?—Yes.

East London, Monday, 16th March 1914.

Major-General Sir Edward Yewd Brabant, K.C.B., C.M.G., called and examined.

(*For the evidence of this Witness on "Animal and Agricultural Produce" and "Cotton," see pp.* 209 *and* 279).

The witness made the following statement:—

What we want is a much larger population. We want the large farms broken up. The Komgha district, which is the next one to this to the eastward, is one of the best for mixed farming in the country, and I do not think that any man there ought to have more than 500 acres, and you could keep a large population on this land, giving them from 20 to 50 acres. I may say that when I first went into Parliament I carried a resolution in favour of introducing Scandinavian and Scotch farmers. We put them on the very worst patch of ground we had, and most of them have done well. Some of them have made fortunes. I know one man who began with 20 acres only and died the other day with 2,000 and a large sum in the bank. And others have done almost as well. Of course, you have failures. There always will be those.

501. **(Mr. Sinclair.)** Do I gather from you that large areas of good land are now in private hands?—Yes. The larger farms in this district run from 1,000 to 2,000 acres, and they are almost all in private hands and are not, as a rule, developed.

502. You favour the cutting up of these areas into smaller farms?—Yes.

503. Is there any way of bringing that about except by a land tax, do you think?—It is gradually coming about without any attempt in that way by the demand for small farms. Only this morning one of the leading auctioneers told me there was a great demand for small farms.

504. By your own people?—Yes, people already in the Union, people retired from business.

505. Do they get those small farms at prices which will enable them to make homes for themselves and live comfortably?—At present, undoubtedly. I believe that in the United States land such as we have here would be well worth 20*l.* an acre; the extreme price now being given is 3*l.* an acre.

506. That would seem to be a reasonable price?—Yes.

507. Are those holders of large areas of farm land that you refer to ready to cut up their land at about 3*l.* an acre?—Well, of course, in some cases. It sometimes happens that for various reasons a farm is sold, and they find it better to sell it in two or three portions rather than as a whole.

508. The point I want to find out about is whether small farms are available for settlers to-day if the small settler wants to come in?—I am afraid not. It is difficult now to meet the demand for small farms.

509. That is, the demand by those who are already here?—Yes.

510. Would you suggest there was room for outsiders to come here and take up small farming?—Under a proper scheme of immigration there is abundant room. There is room for a very large population between here and the Keiskama.

511. Would the land be available?—You would have to look out for farms and buy them as they became vacant.

512. Do you think the competition of new-comers would run up the price?—Eventually, no doubt. I do not understand why men who are situated as I was when I first settled, an officer on half-pay, do not come out and settle on this land. You need not work very hard, and you have advantages such as no other Colony has in the way of labour. Your wife is not compelled to work as she is in Canada or Australia, and I have never understood why a large number of that class has not come out.

513. **(Sir Rider Haggard.)** Do you consider that the population in this part of the Cape Colony is

insufficient for intensive farming?—Entirely insufficient at present.

514. How would you propose to add to it?—I can only say this. We carried out a scheme some forty years ago of getting a quantity of land, dividing it up, and giving to each family, say from 15 to 20 acres of agricultural land, leaving the rest of the land which is not so well suited to agriculture as commonage, and then at the end of ten years, giving the right to the commonage to those people who held the agricultural lots. We found that plan work very well, and in that way we settled these Scotch and German immigrants. I think they have all since bought up the commonage.

515. Where would the capital come from?—That is the difficulty.

516. That is a vital difficulty?—Yes, you will not get the Government to do anything. The only hope is perhaps that some of these millionaires may do something. For example, Sir Percy Fitzpatrick is carrying out a scheme in connection with a syndicate for cutting up land on the Sundays River and giving it out to settlers. But there he has to irrigate. Here, there is no necessity for irrigation. I have never lost a crop through want of moisture, though I have lost some through too much water.

517. There is not the population necessary to attain the ends you consider so desirable, and you do not see how it is to be overcome because of the difficulty of providing the capital?—Yes.

518. I think you said also that the farms which have been taken up lately are largely occupied by people retiring from business?—Yes.

519. That is not the class, is it, that you would expect to plunge into very vigorous agricultural operations? They are generally elderly people who require rest, are they not?—Yes, to a certain extent. I think the tendency is rather to overdo it. I think they try too much farming.

520. And they are rather apt to fail—lacking previous experience?—Yes.

521. Therefore, you can hardly look upon them as serious and *bonâ fide* farmers—persons who are seeking rest in the evening of life?—Yes. But these people generally settle in the neighbourhood of the town, and go in for dairy farming and supplying the town with milk.

522. There is a difference between a man aged 60 at the end of his business career and a young man who takes to farming as a trade?—Yes.

523. You spoke of the top price of land as 3*l.* an acre?—Yes.

524. Does much of it come into the market?—No, not very much.

525. What class of land is it—deep loam?—The district varies very much. In some parts it is a black loam, 8 or 10 miles away from the coast on the ridges, of about 2 feet in depth. Generally speaking, the land between the valleys is rather poor, and only suitable for grazing, but in the valleys there is plenty of alluvial soil, which is very rich.

526. Are you speaking of ground that can be purchased for 3*l.* an acre?—I am speaking of the whole thing. A farm of, say, 1,000 acres may have 100 to 200 acres of good agricultural land, and the rest would be grazing land.

527. What would the average price be?—About 3*l.* an acre.

528. I thought you said that was the top price?—I am told that you cannot buy land at all under 3*l.* an acre now.

529. What you really think is that the sort of farming which is available here is a kind which would be suitable, for instance, for Indian officers at the end of their service—the man with some little capital who wants to take up farming for a livelihood?—Yes.

530. **(Mr. Campbell.)** In regard to the farms in this district: you gave your estimate, I think, of a standard farm as 500 acres, and I think you said it is the retired tradesman who takes them up?—I said that no man ought to be allowed, if it could be done, to have more than 500 acres. The majority of our farmers who have 2,000 acres have neither the capital nor the labour to develop the farm.

531. Do you think there should be legislation with a view to cutting up these large farms?—It is a difficult thing to say that. If I were an autocrat and governed the country as I liked, I might make a law to that effect, but as things are at present I am afraid we cannot.

532. Do you think that legislation, provided it could be carried out, would be valuable?—Yes, undoubtedly.

533. On a farm of 500 acres I think you said that mixed farming could be carried on?—Yes. You would have to keep a certain amount of cattle, and go in for agriculture to a certain extent.

534. That is, cattle and sheep mixed with wheat-growing, for instance?—No, wheat won't grow here.

535. What will grow?—Maize, cotton, beans, and a variety of things like that, and fruit, of course. It is a splendid district for tropical fruit—bananas, custard apples, mangoes, and oranges.

536. Where maize is grown the pig ought to do well?—Yes.

537. To carry on mixed farming like that on 500 acres of land—which, I presume, is the land valued at 3*l.* per acre—a man would need to do practically the most of the work himself, would he not?—No.

538. Would he be able to employ labour?—Yes.

539. Profitably?—Yes. There is a great deal of difference between myself and the bulk of the farmers in this district in regard to labour. I have never had the slightest difficulty in getting all the labour I wanted. Many farmers say that they cannot get labour, but if a farmer once gets a bad name as a master it is impossible for him to get labour.

540. Could a man, unless he had independent means to some extent, make a living on a farm of that size and value without doing a large amount of the manual work himself?—It would be much better to do the manual work himself, and the really good farmer always does. The Kaffir works infinitely better when the white man works with him.

541. Is manual work on farms the rule in this district—by white people?—Yes, though not so much by the large farmers.

542. They do cultivation work?—Yes.

543. Is much machinery used in the cultivation of maize, for the cultivation of the plant and cutting it, or is it all practically hand work?—Up till recently there has been very little machinery used, but now they are going in very extensively for machinery. Up till recently, manual labour was so cheap that it would hardly pay to use machinery. Up till the last few years you could get Kaffirs for 10*s.* a month, with mealies and milk, but now wages are rising.

544. The higher wages demanded by the native is causing the introduction of machinery?—Yes.

545. Is that going to be a continuing condition?—Yes.

546. The rise in wages will go on?—I am afraid so.

547. In reply to Sir Rider Haggard, you spoke of settling immigrants on the land, and you spoke of acquiring land and dividing it up. Do you mean the compulsory re-purchase of land by the Government?—No, I do not think there is any chance of getting that land. But I mean in the same way as Sir Abe Bailey bought his farms in the Colesberg district—buying up a block of farms as he got the opportunity—and giving perhaps a trifle over the market price.

548. Do you think that land bought at something over the market price—a large area—would pay when cut up into small settlements?—Yes, I think so.

549. Because the tendency is for large areas to be held at a better price than small farms?—No. Where you can get the European family to live on a farm of 50 acres by intensive cultivation they will make that land infinitely more valuable and enable them to pay for it.

550. Are there estates large enough in this district to make it possible and worth while to cut them up for a number of families?—Oh, yes; if you bought a farm of 2,000 acres you could put 10 or 12 families on it without any difficulty.

551. Do you contemplate doing the whole of the

East London, 16 *March* 1914.] Major-Gen. Sir E. Yewd Brabant, K.C.B., C.M.G. [*Migration, Land Settlement, and Irrigation.*

work by private enterprise?—It is the only way of doing it, as far as I can see.

552. **(Chairman.)** In regard to native labour, do you say you have always had a plentiful supply?—I have, personally.

553. What do you attribute that to?—To my getting a good name.

554. How do you get a good name?—By paying regularly and paying the top current prices for labour in the district, and also by treating them with a little sympathy. I have found by experience that one has to put oneself in their places sometimes.

555. In regard to the natives you have working for you; do they live on the land?—As a rule.

556. With their families?—Yes.

557. Has that a great influence with them in inducing them to stay?—Yes. As a general rule you give them about two acres which their wives cultivate for mealies for their own consumption. And on a large farm they generally allow them to run eight or 10 cattle of their own.

558. What is your view generally of the native labour question here, where the labour is wanted in large quantities?—You would have to pay a high price for it. But that you can get it is evidenced by the mines, where they have 250,000 natives. We have immense reserves of native labour in the Transkei. If you offer a sufficiently high price you can get it.

559. Then, the current rate not being sufficient to bring them out, you think a higher rate might be?—Yes.

560. It is the ordinary question of supply and demand?—Entirely. A large number of men are employed on the wharves here in handling goods, and I believe there is no difficulty in getting them. I do not know what the price is, but nothing very high. And I am told by captains who come here that their work compares very well with that of the London dockers, man for man.

561. Your remedy for the deficiency of labour is to bring more out by paying a higher rate?—Yes.

562. Has the possibility of taking his family with him a great influence in inducing the native to come away from his kraal?—Yes.

563. You said something about the example of the white man working with his natives. The view is sometimes taken that it demoralises both of them?—No, that is absolute nonsense. When I began, my sons worked with the natives. My sons were all strong men, and they said it was just as much as they could do to keep ahead.

564. And their working with them made them work better?—Yes. And I may give another instance. When this railway was first built, they sent out some English navvies. As you know, that is a strong class of men, and they acknowledged that it was just as much as they could do to keep up with the natives. Now that kind of work is the best that he is suited for. He is not so good where deftness of fingers is required.

565. But is it not the case where you get whites and natives working together, that after a short time the white does not do any manual work?—No, I do not think so. I know a great many farmers in this district who always work with their men and they are not demoralised.

566. You spoke of Kaffir wages having risen: can you state from your own experience to what extent they have risen in the last twenty or thirty years?—It depends on whether you are near the town or further away. Near the town, we are paying now from 1*l.* to 30*s.* a month with food.

567. How much do you calculate the food is worth?—About 3*d.* or 4*d.* a day—that is mealies and milk. That is outdoor workers. Of course, the indoor servant or groom would come out differently. But when you get further away from the town, say 20 miles, you would pay 12*s.* a month.

568. That compares in what manner with the wages paid twenty or thirty years ago?—It is about double. You can get Kaffir women now for 9*d.* a day without food for cotton-picking, or any work of that kind.

569. Is the work of the Kaffir women of a high quality?—No. They require a great deal of looking after and constant watching.

570. Well looked after, do they get through their work well?—Yes.

571. You spoke of retired officers and Civil Servants coming out here and farming. What capital is required?—It depends entirely on the size of the farm. It would not require much capital if a man was satisfied with a small farm.

572. What size of farm is in your mind?—Well, I should say from 300 to 500 acres. That would cost about 1,000*l.* to buy it.

573. How much to stock it and so forth?—I should advise a man of that kind not to begin on too large a scale. The smaller the scale the better, because he will have to pay for his experience. That is the great fault in this country with our young Colonial farmers. They begin on too large a scale, and if they have a bit of bad luck at the beginning they are done for. If they would only begin on a small scale and work up it would be a different matter. The men who have made fortunes in this country are those who started with almost nothing. I have now in my mind a young fellow who started about five years ago. He was simply a manager on a farm, and was allowed to cultivate for himself and so on. Well, the farm is being sold now, and he is giving it up, but he has cleared 1,500*l.* of his own money, made entirely by crops and a few head of cattle. He had absolutely no capital to start with.

574. You spoke of agricultural machinery being brought in owing to the rise in the price of labour. Do you get your machinery in fairly cheaply?—I could not say. I do not know the price. I should say we paid rather dearly for it as compared with the price in America to-day.

575. **(Sir Rider Haggard.)** When you said in answer to the Chairman that you approved of the white man working with the native, you were referring to the master working with his men?—Yes.

576. You were not referring to white and black working shoulder to shoulder?—No.

577. Has land risen very much in price during the last twenty-five years?—Yes. I bought a farm forty-four years ago for which I gave 4*s.* 6*d.* an acre, and I sold it the other day at 2*l.* 10*s.*

578. In those days the country was almost wild veldt?—Yes, and the country had a bad name about here.

579. Unhealthy?—No, stock did not do, and people would have nothing to do with agriculture. Sheep farming was looked upon as the only pursuit for people out here.

Kimberley, Wednesday, 18th March 1914.

Mr. Arnold Wilson Wall, Manager of Messrs. Stewarts and Lloyds (South Africa), Ltd., called and examined.

(*For the evidence of this witness on "Bills of Lading," see p* 88.)

580. **(Chairman.)** You are, I understand, interested in the pipe trade?—Yes, I am.

581. And you appear to give evidence in regard to irrigation from the point of view of the pipe trade?—Yes. I can only speak in general terms. I should say in the Kimberley district in the past two or three years irrigation has gone ahead by leaps and bounds. We have three rivers—the Vaal, the Orange, and the

Modder, and I should think that within a radius of 150 miles within the past three years something like between 70 and 80 suction-gas engine plants—pumping plants—fairly big schemes—have been put down. I may specially mention that the plant that my firm put down at Hopetown, for a syndicate of farmers there, has been very successful. It was absolutely bare veldt when they started. I wrote to them the other day saying I proposed to give some evidence before this Commission and asking them for particulars of their scheme. The secretary replied:—"In reference to our "irrigation scheme, and the pumping plant installed "by Stewarts and Lloyds, this plant was completed "last May. We have had this season a very successful crop of oats and wheat. Our lucerne fields are "doing well. Altogether we have 80 acres of lucerne "and 35 morgen of oats and wheat. The yield was "good and the crops are of splendid quality. We "find our apple trees do exceedingly well on this soil, "and a large industry could be established here in "growing apples for cider and light wines."

582. You see very great possibilities in the direction of irrigation?—Yes, undoubtedly.

583. In the direction of numerous small schemes?—Yes.

584. Or do you see large schemes too?—I should say in this part of the country you must have large schemes.

585. Which involve co-operation?—Yes, in this instance. I think there are about thirty of them who combined together and leased a piece of land from the Municipality of Hopetown, and I think they have a capital of something like 3,000*l*. The scheme I put down for them cost a little over 1,000*l*., but I do not think there is much chance of any schemes for lesser amounts to make it a paying proposition.

586. **(Mr. Campbell.)** Have you any knowledge of irrigation work—have you been anywhere where the schemes have been successfully carried out?—Yes.

587. **(Chairman.)** You are responsible for schemes yourself?—Yes.

588. **(Mr. Campbell.)** Those are small irrigation schemes by individual farmers that you speak of?—Yes.

589. What do you call a big scheme here? What area of country would you calculate to cover in a big scheme?—Oh, well, that is very difficult to answer. You could irrigate hundreds of morgen in some places for a comparatively small sum, while in other cases you could only irrigate 200 morgen for a very much larger sum. It would depend on the lay of the country.

590. In reply to the Chairman, you spoke of pumping plants having been erected?—Yes.

591. As a matter of fact, successful schemes hitherto in this country have been flooding schemes have they not?—Yes, by gravitation.

592. It is simply flooding the river over the adjoining land?—Yes.

593. There has been no very great or successful attempt to conserve water and distribute it by channels over the land?—Yes. There is a very successful attempt at Douglas, fifty miles from here. It is a Government scheme. They dug a furrow and brought the water out of the river, and distributed it over the land by gravity.

594. Is that doing well?—Very well indeed.

595. What is the name of the scheme?—The Douglas scheme.

596–7. Cultivation is being carried out under that scheme?—Yes.

598. **(Sir Jan Langerman.)** Who would benefit by the Hopetown scheme?—A good many people benefit. The whole town benefits.

599. Private owners?—Yes—it was a syndicate which was formed.

600. The Government undertook the scheme in the interests of private owners?—As regards that scheme, the Government did not have anything to do with it at all.

601. Who then?—It was a syndicate of farmers themselves.

602. Why did you mention that one?—I thought the Commission were desirous to know what was being done in this district.

603. Would you advocate that the Government should undertake schemes of that sort?—Yes.

604. And you think that a large population for settlement purposes could be put on the land?—Yes; I think so.

605. What could be grown there?—Those people are growing everything practically—oats, wheat, lucerne, and fruit.

606. This refers to what river?—The Orange River.

607. You think a large settlement could be formed?—Yes, I feel convinced of it.

608. You think there is much room here for that purpose?—Yes.

609. What area do you think could be brought under cultivation in the Hopetown District?—Hundreds of morgen. I could not give you the exact figures.

610. You can grow all the cereals that we want then, really?—Yes.

611. **(Sir Rider Haggard.)** I want you to tell us a little more about the Hopetown scheme: how far is that from here?—A little more than seventy miles.

612. What is the extent of the area irrigated?—Roughly, I think, about 600 acres.

613. Who are the owners?—A syndicate of local gentlemen in Hopetown. One is a bank manager, another an attorney, another a storekeeper, and the rest are farmers.

614. What is the capital of this syndicate?—I think 3,000*l*.

615. What was the prime cost of the land?—They did not buy it. They leased it from the Municipality for twenty years.

616. Are they working it at their own expense on a twenty years lease?—Yes.

617. What would be the value of such land in its raw state first of all?—I should say ten shillings an acre.

618. And what would be its value when irrigated?—That is problematical. But for myself I think it would be worth anything up to 50*l*. an acre.

619. And at the end of twenty years they have to make a present to the Hopetown Municipality of the difference between 10*s*. and 50*l*.?—That is so.

620. What will it grow there?—Everything practically.

621. Fruit?—Yes.

622. What is the rainfall?—I think the average is the same as Kimberley, which for the last five years would be from 12 to 15 inches per annum.

623. What is the depth of soil?—It varies. In some places it is 20 to 30 feet and in other places less.

624. Has it the same characteristics as the district of Prieska?—No.

625. In what way does it differ?—I cannot explain that, because I am not an agriculturist, but I know it is different.

626. How long have they been cultivating there?—About two years.

627. They are doing well?—Yes.

628. Is there much more of such land?—Quite a lot; hundreds of morgen.

629. Or thousands?—Thousands. It is boundless.

630. In fact, a huge area which could be brought under irrigation?—Yes.

631. Would there be any trouble, legally or otherwise, in getting the water for that irrigation?—As far as I know I do not think so. But, of course, it is a difficult matter in regard to these riparian rights. Still, it is not insurmountable.

632. Supposing people put their money into it, they might be brought to a full stop by those who have the rights refusing to allow them the water?—No, I think not.

633. You suffer from drought in these parts?—Yes, severely.

634. Does it not suggest itself to you that if you have these conditions of which you have spoken, it might be well worth while to follow up these irrigation schemes?—Yes.

635. Is that being done with the exception of this one?—Yes, quite a lot of big schemes are in hand.

636. Are they in operation?—Yes, all in operation.

637. And you say there are many thousands of morgen more which might be put under water?—Yes, undoubtedly.

Mr. W. H. Carter, called and examined.

638. **(Chairman.)** You have a considerable knowledge of irrigation from the farmers' point of view?—Yes, we have a small scheme at work.

639. Have you prepared a note for the Commission?—I am sorry to say I have not, but I have the different details here.

640. Will you give us the essential heads, we will not go into details?—From the junction of the Riet river to the Vaal river is a distance of about 45 miles. On that 45 miles there are about 19,000 acres of land that can be developed by irrigation at the present time. There are about 2,000 acres of land already developed. And then, again, along the Vaal river to the junction with the Orange river, another 40 miles, there is a further large quantity of land which can be put under irrigation.

641–2. Can you give us the figures?—I should say it is about 10,000 acres. At present, there are about 2,000 acres under irrigation by means of different schemes, and the farmers grow lucerne forage, and down at Douglas there is a lot of fruit grown. But the difficulty is in getting that produce to the market. We are about 70 miles from Kimberley, and it is a bad road. We have no railway connection. If we had railway connection, we should grow any amount of stuff, because the soil is from 30 to 40 feet deep, fine alluvial soil. I was down there last week and saw peaches nearly the size of my hand and apples also. It takes about five or six days to make the journey by ox-waggon, so to bring the fruit into town is impossible. There is one thing I might mention: a great amount of this land is held by farmers who are not of a very progressive nature and they have not sufficient means themselves to carry out schemes, because the river lies down below the surface of the ground, a distance of about 40 feet and gravitation schemes would have to be worked after weirs had been erected. My contention is that if the Government would only make a railway for use along the Riet river we should be able to bring produce into Kimberley market, and send it to Johannesburg and other parts of South Africa. Any amount of lucerne forage, fruit and vegetables of all descriptions can be easily grown there. For instance, in regard to the Douglas scheme that has been at work for the last twenty years, the people there are in very poor circumstances and they cannot dispose of their products. I have been there sometimes and could not buy forage. That gravitation scheme at Douglas has cost the Government over 40,000*l.* Lately the Government has bought another three farms below Douglas, called the Bucklands Estate, and are extending the gravitation scheme. They will have about 2,000 acres that can be put under cultivation but unless we have a railway it is useless.

643. Are there any other points?—As regards the natural resources, as I mentioned, the Riet river is a matter of about 40 feet below the surface of the ground and you would have to consider the building of weirs to raise the level of that water. There is no doubt, then, that gravitation schemes could be utilised and the flood waters could be utilised at certain periods of the year. At the present time the flood water is coming over our weir about 18 inches deep, above the crest of the weir. Our weir is about 480 feet long. If other weirs were built, all that water could be conserved and used on the land, and in cases of drought like this it would be of immense benefit.

644. **(Mr. Sinclair.)** As soon as the Government is in a position to expend large sums of money on railways and irrigation schemes, where the irrigation schemes are too large for private enterprise, a considerable settlement will take place and there will be greater production in the areas to which you have referred?—Yes, certainly.

645. You realise, I take it, that a large expenditure of that kind must go comparatively slowly; everything cannot be done at once?—Certainly.

646. The development of every new country by railways and other public works must be gradual?—Yes.

647. Can you tell us what has already been done by the Government for irrigation purposes in the areas with which you are familiar?—What the Government has done is this—I think they purchased this property of the Bucklands estate and paid 18,000*l.*, and made a furrow from the Vaal river; I believe that cost about 30,000*l.* They erected a weir and sold the land. They sold the land to different people, about 2,000 morgen, with the option of paying up in a certain number of years. When that land was put up for sale many people rushed in, thinking they were going to make a fortune. In some instances they paid about 200*l.* a morgen for the land. The people who bought this land were poor and could not pay and it has consequently reverted back to the Government and the Government has had to re-sell it to other people.

648. What does that point to, that the land would not bear the expenditure that had been made upon it?—It would bear the expenditure, but I must admit that the men who bought it did not know exactly how to work it, they had practically to gain their experience of irrigation; they went in for fruit trees and produce of that kind and when the fruit came to perfection they had no means of disposing of it.

649. But I take it that they were the highest bidders for the land when it was put up?—Yes.

650. You think that part of the failure was due to the fact that they were unsuitable settlers?—In many cases. My argument is that this irrigation work requires men who have had experience in irrigation with energetic dispositions. Now, many of the farmers in that neighbourhood are not of that kind, they have gone in for ostriches—I do not know how this slump in feathers will affect them. But we have gone in for lucerne forage, and mangolds principally to feed our own stock, we have not disposed of anything, but it means that we have to keep about 200 to 250 oxen to carry this stuff to our different farms, whereas if we had a railway we should not require those oxen.

651. No doubt if you had a railway it would bring the produce nearer to market, but to go back to this scheme of which you tell us, do you think that the price that was paid by those settlers was too high, supposing they had been fitted for the work?—Yes, it was far too high, it was undeveloped land, it was not planted, there were no furrows, in fact it was bare veldt.

652. Are you speaking of the land that was sold by the Government in Douglas?—Yes.

653. You think that the price was far too high?—Yes.

654. Would a lower price have justified the expenditure; in other words you can spend on land by irrigating it more than it is worth?—Yes.

655. In regard to the land on which the Government made its experiments, was much money spent on it?—I think so. For instance, very often private schemes are put up at less cost than Government schemes, there are so many overseers to be paid.

656. Do you suggest, then, that the scheme was extravagantly carried out?—They had various difficulties to contend with; I suppose they had washaways that cost a large amount of money; and also in connection with their main furrow, I think, they had to compensate some of the adjoining farmers for passing through their land.

657. I take it that had to be done?—Yes.

658. You are advocating, on the one hand, that the Government should do more in developing schemes for irrigation?—Yes, they should build weirs and also expropriate a lot of this land lying along the river.

The Government has practically no land along the river at all.

659. You advocate that the Government should do this, in view of the particular instances you have put before us which resulted so unsatisfactorily?—That is a matter which happened about twenty years ago and the Government has profited a good deal by experience since then.

660. They have gone in for many schemes which have been successfully carried out?—Yes.

661. As a matter of fact, is not the Government at the present time having systematic surveys carried out throughout the Union as to the directions in which irrigation works can be carried out?—Yes.

662. But that is not being carried on, perhaps, as quickly as you suggest it should be?—Yes

663. That is really the point of your complaint, if it be a complaint?—Yes.

664. **(Mr. Garnett.)** Have I rightly understood you—your opinion is that in these remote regions that are suitable for irrigation, unless there are railways made to bring the produce from those places to market, the money is simply wasted?—Yes.

665. The general conclusion is that, *pari passu* with a construction of irrigation works, railway construction into the area so irrigated should proceed?—Yes, it is the same as in America, they take the railway there and the population follows; here we want the population first.

666. **(Sir Jan Langerman.)** In regard to this scheme which you mentioned just now and which was so disastrous, you say that happened twenty years ago?—Yes, it is still being carried on, but I believe to-day it is more successful, because the people who originally had possession of the erven have gone out and new-comers have taken up the land.

667. So you do not quote that as a typical case of Government incapacity to carry out such schemes?—No.

668. You think to-day that with their experience they would do it better?—Yes.

669. Are the farms which the Government bought near the railway line at all?—No, it is a matter of about 70 miles from the railway; Belmont is the nearest railway station.

670. What induced them to do that, did they have an idea of building a railway at that time?—Yes, we have been trying for years to get a railway made to Douglas. In the old Cape Parliament a sum of money was voted to build a railway from Belmont to Douglas, but the war intervened, and for different reasons it has not been proceeded with.

671. On what basis did the Government dispose of the land?—They sold it outright.

672. The Government has no interest to-day?—Under the old scheme they sold the land outright, but under the new scheme it has not been put up for sale, the matter is still in abeyance; they are constructing a furrow to carry the water.

673. On what terms will they sell now?—I think they will sell it right out freehold, except that purchasers will have to pay a certain water-rate for the upkeep of the furrow.

674. You agree with the last witness that there is a large area for closer settlement?—Yes, provided you get the right class of settler and make railways to bring the stuff to market.

675. **(Mr. Bowring.)** I gather that you think that private irrigation schemes have been more successful as a whole than the Government schemes?—They have, up to the present.

676. And there have been a great many of them?—Yes.

677. Assisted by the Government?—Not that I know of; it has all been done by the people themselves, but Government will assist them, they will lend money at 3½ per cent. interest.

678. For approved schemes?—Yes; we have to submit our scheme, and then they send down a surveyor and engineer who pass their opinion on the scheme and help us to make out plans.

679. There is no reluctance on the part of the Government to provide money for approved schemes?—No.

680. Do you advocate private measures of that kind rather than Government schemes?—Well, in regard to large schemes it is too much for a farmer. Our schemes cost us practically 10,000*l*. Hundreds of farmers have perhaps 1,000*l*. or 2,000*l*., but they have not sufficient capital for a large scheme, and they have to get money from the Government. In regard to a scheme for the construction of a dam in the Vaal River, for instance, that would be impossible for a private individual, but if they had a dam in the Vaal River land could be irrigated 40 or 50 miles away and there would be enormous possibilities.

681. And the Government are better able to settle the private water rights than the individual or corporation I suppose?—Yes, I suppose so, because as a private individual you have to pay for a servitude for an abutment to land your weir on your neighbour's property for the storage of the water.

681A. The Government, I suppose, makes concessions in such cases?—Yes, if there were Government land, but there is no Government land for irrigation purposes along the river that I know of.

681B. But you are rather inclined to think that private irrigation schemes are likely to be more successful than the Government?—The small schemes.

681C. But the larger schemes the Government must do?—Yes, the great thing, however, is for the Government to assist in building the railways or making better roads for the conveyance of our goods to market.

681D. **(Sir Rider Haggard.)** Lacking a railway, which is expensive, would not a good road and a few motor vehicles help you a great deal?—Yes, certainly they would.

681E. Is that beyond the possibilities of co-operative action?—It should not be, but I know the Divisional Council, which has to construct these roads, have so many roads in the district to look after that they have no money to build a good road through this district. In some parts you have to go through sand 9 to 10 inches thick.

681F. But with the large profit in sight do you not think that might be managed, not only here but in many other places where they are crying out for railways for which they will have to wait a generation?—We have tried, but the Divisional Council has no money to build the railways.

681G. But the individuals concerned in raising the produce might join together and form a mutual scheme and have some motor drays. I only throw this out as a suggestion. In regard to lucerne, have you a good market here and in Johannesburg for lucerne, hay, and green stuff?—I think there is a good market. People from Modder River will be better able to speak about that. We use our lucerne ourselves to feed the ostriches.

682. If you grew a great deal of lucerne on these irrigated lands you might get a handsome return?—Yes, but the cost of bringing it to market at present would be 1*s*. 3*d*. or 1*s*. 6*d*. per 100 lbs.

683. But I am suggesting that might be modified by a decent road and motors?—Yes.

684. Other witnesses have told us that there is a great deal of land that could be irrigated; is that land held up tight?—Yes, it is in the hands of private people.

685. Will they sell?—They will but the majority will ask a high rate per morgen; I know they want 5*l*. and 10*l*. a morgen. Mr. Wall said 10*s*. an acre.

686. Is it undeveloped land?—Yes, lying along the river.

687. Are they making any use of that land themselves?—No, it is practically simple farming.

688. Is it dry land?—Yes, you would have to instal suction gas engines to raise the water.

689. So it is rather a dog-in-the-manger policy on the part of these people?—Yes.

690. Have you any legislation in this country for breaking up big estates?—Not that I know of, I believe there is some in Natal.

691. You think that the real wealth of this country lies in agriculture and in the fruits of the soil?—Yes.

692. And there are plenty of fruits to be got if you only go the right way about it?—If you had the water. Our soil is magnificent.

693. You have lots of water in the rivers?—At certain times only.

694. A lot of water runs to waste?—Yes.

Mr. A. R. Radloff, Jr., called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce," see p.* 210.)

695. **(Chairman.)** You have something to tell us about artesian water?—That was a matter which was brought before me just before this meeting, and I am not able to give you very much information, exeept as far as my practical experience goes. Unfortunately, I happen to reside midway between the Vaal and Modder rivers, and we have had to depend on our supplies from artesian sources. We have gone in for irrigation on a small scale, but that is limited to the supply obtainable. I may mention that we have also gone in for a suction gas plant, whereby we convert the power into electricity, and we do all our pumping by that means. We have not been able to strike a strong stream yet, and therefore we are getting our supplies from three or four different points.

696. What depth do you get water at?—The depth ranges from 15 feet in one place to 203 in another.

697. And how plentiful is the supply at those depths?—At one point we struck a supply which gave us ten thousand gallons per hour for 6 hours by accumulating the water through the night, say, for 12 or 15 hours.

698. And the other sources?—Of course, the other sources have been mostly from boreholes and wells.

699. And how much do you get from them in 24 hours?—In regard to this main source I am speaking of, that would deliver us about 60,000 gallons daily.

700. And continuously?—Yes. But on account of not having our rainfall as in the past years, that supply has diminished very greatly, and at present we are in a very sore plight as far as this is concerned.

701. Has the drought affected all your subterraneous supplies?—Yes.

702. By lowering the level of the water?—Yes.

703. And by diminishing the amount?—By both. Because in one particular spot, when we originally started this scheme, from the levels we took then, we are now drawing our water fully twelve feet deeper than when we started, two years ago.

704. Generally speaking, what is the quality of the water?—Fit for stock.

705. For human beings also?—Yes.

706. For agriculture too?—Yes.

707. Always?—No. Sometimes you happen to strike certain underground streams which are somewhat saltish, and contain a great number of minerals. The water from one borehole that we are now using contains a large percentage of minerals and I suppose it is not more distant than four or five hundred yards from another source which is very good water.

708. Generally speaking, then, this water is used for watering stock on your land?—Yes, mostly stock, and we also divert a part for irrigation. This irrigation is very limited on account of the diminished underground supplies. We can only irrigate about three morgen, and on account of this drought we have even had to give up more than half of that.

709. What is your calculation of the cost of raising water from these depths, taking into account the cost of erecting the pumping machinery, and so on?—The cheapest cost of getting water is by wind power. Of course, you can utilise horse power and other means cheaper than suction gas plants.

710. What do you calculate that the water costs you per 10,000 gallons; can you form any estimate?—It would roughly come to 2*s*. 6*d*. per 10,000 gallons.

711. Are a large number of pumps being put down all over the country now?—Yes, mostly windmills. They are mostly put down by the poorer class of farmer, who cannot afford a big initial outlay.

712. Is their use extending largely and rapidly?—Yes. The farmers are gradually discarding the old ways and putting up windmills.

713. You can count on regular winds to give you the motive power?—Yes, we have plenty of wind.

714. **(Mr. Sinclair.)** Is the supply from those sources holding its own?—To a certain extent it has diminished, but there is still, I imagine, a tremendous supply at greater depths

715. You state, as I understand, that as your rainfall lessens the supply from these bore-holes lessens too?—Yes.

716. Very well, if there is an extension—a considerable extension—of trying to tap water under those conditions, if the supply is dependent on the rainfall must it not diminish also?—It is bound to. But my idea is that the underground water is supplemented by some underground sources of supply, and, of course, by drilling to a great depth you would naturally strike stronger streams.

717. Is there any theory as to the existence of water other than the rainfall source?—Of course, as regards the artesian sources, I may mention, for your information, that by drilling down lower we have got a better supply. We put down one particular hole, and when we got to a depth of 97 feet a small supply was struck, but fortunately the drill was able to proceed further, and when we came to 198 feet we struck what we would call almost a permanent supply, and that supply has not diminished; in fact, that supply rose to 70 feet from the surface from the 200 feet level.

718. You say that is not due to rainfall?—It is not altogether due to the rainfall.

719. Have any considerable experiments been made in boring for such water?—Not to any great extent.

720. Has the Government done anything in this locality in that direction?—Not in Griqualand West. In the past they have leased the drills to private owners at a certain rate, and they have had drilling done through that system, but I believe that system has been discarded, because private individuals could do their drilling cheaper than by the Government system. That was the experience of a neighbour of mine.

721. Do you think that the encouragement that has been given in regard to experiments that have been made in the past warrants extensive attempts to tap that water?—I think so. If we could only get certain drills to penetrate the dolomite. At present the drills we have cannot go through this, but they are getting out machines now which will go through it and thereby possibly open lower sources.

722. Who are importing those?—Private people.

723. **(Sir Jan Langerman.)** In regard to drilling, you say you find it cheaper to drill by private contract than through the Government?—Yes.

724. What do you pay the Government?—When the private drilling was done at ten shillings a foot the Government charged about twelve shillings.

725. What do you pay for your drilling?—It all depends on the conditions. Conditions have altered very much in the past. At present you have to find the fuel and water and the charges are from five shillings to six shillings a foot.

726. Is that a six inch drill?—Yes.

727. Can you get a drill freely for that?—Yes. The drilling is only carried on by private individuals.

728. Are there a lot of people about who do the drilling?—Yes. There are several private companies who do it, and that rate, I should mention, is for the first hundred feet. The deeper you go the higher the rate. From six shillings it goes to eight shillings for

the 100 to 200 feet level, and from 200 feet to 300 feet level it goes to ten shillings.

729. And after that it is ten shillings as deep as you go?—They do not go below three hundred feet. Experience shows that you usually strike a supply at 200 feet.

730. Do you know if any drilling has been done through the dolomite to see what is below that?—No, they have all stopped there as far as I know.

731. If we go through the dolomite we strike a large supply of water—that is our experience in the Transvaal. You do not know what is below the dolomite, not having gone through it?—No.

732. The Government to-day charge 4*l.* per day, I believe, whatever footage they may drill?—I am not aware of that. I do not know.

733. It depends on the soil they go through, of course, whether it would be profitable?—Yes.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. GUSTAV BAUMANN, Government Land Surveyor, called and examined.

734. **(Chairman.)** Would you tell us your present occupation?—I am a Government Land Surveyor, and I have specially interested myself in irrigation in this Province.

735. Will you kindly tell the Commission the points regarding irrigation which you consider of interest?—Well, in my view, in the Free State irrigation has never been properly attempted yet. I have my own theories as to what should be done, but there has never been any real attempt, except in the case of the Koppies Settlement for the poor white, where they have made a storage dam, and in the case of a place on the Orange River near Aliwal North, where they pump the water by turbine, but otherwise irrigation has been attempted in a very small way only.

736. What do you consider to be the most profitable openings for irrigation—profitable to the country?—I do not quite understand. Irrigation, in every case, has proved profitable if the ground beneath the reservoir is of the proper kind.

737. I mean to say what kind of irrigation do you advocate?—Storm-water storage: there is no possibility of other irrigation in the Free State. We allow all our storm-water to run off now. We store a very very small percentage.

738. What is your average rainfall here?—It differs. I would not like to give any definite figures, but I would say that in the west it would go up to 16 inches per annum and in the east it would go to 22 or 24 inches. You can roughly divide the Free State into two parts on each side of the railway line. There is a small section in the east which has more rainfall than the western part. Those figures vary, of course.

739. And during the last three years it has been how much below the average?—I could not tell you. I have not taken any special observations, but we have had very dry years lately, especially the last.

740. Can you tell us whether there has been any previous period of prolonged drought?—There was a big drought in the country, as far as I can gather, in the year 1860. But the present one is far more severe, I think, or at any rate its effects have been felt more, possibly because the country is better stocked.

741. How do you suggest that this storage of storm-water should be carried out—by the Government, or by local associations, or by individual farmers?—The present system is to leave it to the individual farmer. The Government has no national policy of water storage. There are reasons for that. The storage of water by the individual is very laudable, of course, but it is not sufficient, and my suggestion is that it should be undertaken by the Government. That can, however, not occur until there is some law which gives the Government the right of compulsory purchase of land, because the land is held at present in the Free State by private people. The land has all practically been given away and there is little or no Crown land, and what there is is right in the flat districts, where irrigation is impossible. So that any storage dam that was erected would affect the private ownership of land. The land where the dam was constructed and also that under the furrow would be private property, and the moment that the Government undertook any big scheme the private man would immediately raise his price to an impossible figure, unless there was a law compelling him to sell by arbitration.

742. The proposal you put forward, then, is for the Government to expropriate land and carry out irrigation works and then to re-sell that land?—Yes.

743. And the increased price of the land would compensate for the irrigation works?—My scheme would be this, that the settlers or the purchasers of land would pay for the original price of the land plus the cost of the weirs and canals, and pay an annual sum for the upkeep of the works.

744. But now are there many cases where the Government can expropriate land at a fair valuation?—Yes.

745. And carry through the irrigation works you indicate and sell that land again without loss?—Certainly. If you look at the map you will see. The rainfall in the east is much more than in the west, and the land in the east is considerably dearer than it is in the west. It is a big undertaking, but if the water which periodically falls in the east and very regularly falls were to be stored anywhere to the eastern side of the western district, or dry portion of the western district, it could be gravitated to these dry portions, because the land slopes in that direction, and the ground in the western portion could be purchased cheaply and enormously increased in value, so that it would support an enormously larger population than it is doing at the present time.

746. **(Sir Jan Langerman.)** Suppose that the Government were to undertake large irrigation works in the Free State, is there room for it?—In what way?

747. I mean to say, are there facilities—natural physical facilities—for making large irrigation works?—Yes, I believe so. On the borders of the Free State you have the Vaal River, which is a perennial stream. Actual surveys have been made where fairly large irrigation schemes could be carried out. There are several other probable schemes that by inspection would seem to be suitable, where hills meet together and the stream passes between them, but these have not been investigated very closely.

748. Also on the Vaal River?—No, on the Orange River, for instance, and also the Caledon River.

749. But rivers within the Free State?—There are schemes, but they would not be as large as these big river schemes. I understand there are places on the Mud River where schemes are quite possible, and also a survey is now being made, and if the private owners agree, it will be carried through, to use the flood water there.

750. I understood you to say that it would be better if the Government left the private owner alone, and let him do his little schemes himself?—No, according to my opinion, it is not better. I think it is creating landlords.

751. Of course, the Government could not first of all

spend a lot of money for private owners unless it got a benefit too?—That is what I say. In the present position it is impossible for the Government to carry out big schemes until some law is made by which they can compulsorily purchase the ground that they want.

752. Leaving the question of compulsory purchase aside for the moment—because it would be rather hard to dispossess a man of his land if he is willing to pay a certain proportion of the cost of that irrigation scheme—would not a scheme like this be feasible:—If the Government saw a large area—say, half a dozen farms—which could be brought under irrigation, and were to build the works and take half of the land to recoup themselves for the cost of erection, the owners keeping the other half?—I really would not like to give an opinion on that because it would be tantamount to expropriating half the farm, and the present Irrigation Law, which is a fairly good law as far as it goes, gives the private owner the right to co-operate and build a weir. But it does not force the intervening owners to participate in the scheme unless they like to do so.

753. But should not they be compelled?—Yes, that would make the present law more perfect.

754. Because they are holding up large irrigation schemes?—Yes, if they were compelled to join it would be better.

755. So you think there are good schemes still awaiting closer settlement under irrigation as soon as irrigation works can be carried out?—Certainly, all over the country—large and small.

756. **(Sir Rider Haggard.)** When you talk of storing storm-water do you mean storm-water which is to be got in the rivers, or do you mean constructing dams?—No, not making dams. But the small dam is a storm water reservoir—it is a local storm-water reservoir.

757. But which have you in your mind chiefly?—The river.

758. You mean the water which at present runs to waste in tens of millions of gallons?—Yes.

759. You say it should be caught and held up?—Yes.

760. Supposing that were done and the water which now goes to waste were caught and held up, it would be sufficient to irrigate enormous areas, I suppose?—Certainly.

761. It would probably change the whole aspect of agriculture in this country?—Yes. I do not know whether you are aware that in the west the whole farming population depends on the underground supplies and those supplies are gradually sinking. To my personal knowledge, farms in the Luckhoff District, for instance, which have had orchards and vineyards and where fruit has been very plentiful, to-day are dried up, and the natural springs have failed. The whole district practically has had to be abandoned for agricultural farming because these springs have sunk and dried up. And this has been largely brought about by the denudation of the surface of the soil, and the water flowing off much faster from the surface of the ground than it did formerly.

762. That is due, is it not, to two reasons; one the destruction of bush scrub on the surface, perhaps by natives long ago, and the other to the fact that pathways have been made by man and beast which have turned themselves into water-courses?—Yes, the footpaths, the burning and trampling down of the grass and bush, and particularly by the construction of roads and railways. When these were made, no provision was made to collect the water and spread it over the ground again, and the railways have simply made storm-water furrows, along which the water runs into the dongas and so into the rivers and is all lost. The railways are the principal sinners in this respect.

763. I believe there is a school of opinion which believes that South Africa as a country is gradually desiccating, and even pretty rapidly?—Yes, I believe there is something in that.

764. Do you agree with that or not?—I have written about it for the last twenty years, and I am perfectly convinced that the Karroo is gradually encroaching upon the Free State—that it is coming eastward, and that the western districts have so dried up that, as I say, the natural surface springs are ceasing to flow. The east has so dried up that it is now becoming a farming proposition, whereas formerly it was almost too wet to farm there.

765. Then you do think there is a great deal in the theory that South Africa is desiccating?—I am convinced of it, from my own observations. My observations go back as far as 1879, when I started private work.

766. It makes the matter still more serious than it appears to be on the surface?—Yes.

767. It makes the conservation of water more urgent?—Yes, we must really conserve the water or else we shall soon be in a bad plight, and it will not be long before we will be quite unable to farm at all here. I may be pessimistic, but those are my views. I have studied these things and I believe I can prove it.

768. These underground waters: do they come from the skies or from below?—I do not know their origin, but they are caused by intrusive dykes coming through the horizontal rock. The water accumulates against the walls of the dykes. The Boers know them as water veins. As the water percolates from the surface it collects against the impervious face of these dykes, and when these are filled up it causes a spring or fountain.

769. What is the reason for their becoming exhausted?—They have accumulated from time immemorial, and the water naturally made only small cracks in the walls. The water lost in this way was replaced by the rainfall percolating to these underground cisterns. When the country was grass and bush-covered the rainfall used to replenish these springs as fast as the water was tapped, but now the rainfall is allowed to run off the surface of the ground and away to the sea. All over the country they have sunk boreholes and extracted more and more water from the underground system, and they have taken out more than is being supplied from the surface. That seems to be the explanation of the deficiency.

770. Then you fear that the fate of South Africa may ultimately be the same as that which overtook Tripoli and those places on the north coast of Africa in the Roman days?—I am not going to talk about South Africa, I am confining my remarks to the Free State.

771. Do you advocate a measure of compulsory purchase?—I think that is the only way that the Government can possibly make any big irrigation works here, because if they have to purchase the ground at the value which the seller places on it they will never be able to do anything.

772. And that purchase, I suppose, you would advocate should be carried through by means of reasonable valuation by competent and impartial persons?—We have a compulsory expropriation law for the railways. Everything outside of 100 feet has to be expropriated, and if the seller is dissatisfied with the amount tendered him, he can appeal to the arbitration court.

773. And that method, you suggest, should be followed in the case of the compulsory purchase of land for water storage schemes?—Yes.

774. **(Mr. Campbell.)** Does not the Land Settlement Act of 1912 give power to co-operators who wish to carry out an irrigation scheme, provided there is a sufficient majority of them, to compel intervening and unwilling owners to take part in the scheme?—That is the Irrigation Act to which you are now referring, not the Land Settlement Act. That gives them the right of passage, the right of abutment where they have a joint river front. But it does not give them the right to compel anyone to come in if he is unwilling to do so. But he can come in after a certain period. There is no compulsion—it must be voluntary co-operation.

775. Supposing that Act were amended in the direction of giving power to a sufficient majority of co-operators to compel any unwilling and intervening owners to join them in co-operative schemes and giving the majority power to rate the unwilling owner just as they have to rate themselves, would that take the place of the compulsory purchase of land?—It would be an enormous step in advance of the present system, but it

would not put it in the power of the Government to carry out large irrigation works.

776. We have heard a good deal of Government irrigation works in other parts of South Africa—do you know anything of the works that have been carried out by Government?—I know the Van Wyk's Vlei scheme, which was a failure on account of the ground below the water not being examined properly. I know nothing of any other big scheme.

777. Do you know of any Government irrigation scheme carried out in the Union that has been a success?—No, except the Koppies scheme: that might be a success. There is only Kakamas: that is really a Church scheme—that has been a success on the Orange River.

778. There are a number of private co-operative schemes that have been a success?—Yes, but I do not know of any big Government scheme that has been carried out, except Van Wyk's Vlei.

779. Would that evidence not rather point to the fact that at present the carrying out of the work by private co-operators would be preferable to Government action? I do not mean to say, of course, as a general principle applied over every country—but does it not seem that owing to some peculiarity in the temperament of the local landowner it is probable that the private co-operative scheme would succeed better?—If you ask me whether under the present régime, which is dominated by the big landowner, it is possible to pass a law to expropriate the land, I say, "No, it is not possible." As long as the big landowner has the ruling power in the Government he will naturally never allow any encroachment on what he deems his rights.

780. Under those circumstances, do you not think it would be better to proceed along the line of least resistance, and accomplish what you can that way?—Perhaps so; it would seem the only way.

781. Rather than setting up an ideal which you cannot for the present attain?—Certainly,—there is no option.

782. At any rate, you would say this, that the giving of the power to majorities under co-operative schemes to rate the unwilling and intervening landowner would be a very great step forward?—Yes.

783. Speaking about the irrigation schemes that you know of as possible in the Free State, could you give the Commission any idea of the area that would be covered by making use of them?—No, it depends on the length of the furrow.

784. You cannot give any figures?—No.

785. With respect to the carrying out of the schemes themselves: when you speak of making use of storm water—do you mean the permanent conservation of water which would afterwards be used on the land when required by means of channels?—Yes.

786. You do not mean what appears to me to be somewhat a "happy-go-lucky" method of irrigation carried out elsewhere, by which the storm-water is just simply diverted on to the land by means of a temporary and rather flimsy sort of earthen dam?—No; I mean storm-water conserved with the purpose of using it economically, and, as far as I know, the economical use of storm-water in South Africa is almost an unknown quantity.

787. What you are advocating now is the permanent conservation of water and the use of that water after it has been permanently conserved as it is required on the land?—Yes.

788. You are not proposing the Assouan Dam principle of simply flooding the land when the river comes down?—No. Failing that, that is the only way the private individual can make use of it—it is also cheaper.

789. Is the country round here in the Free State good holding ground, when you have in your mind the carrying out of such work as that? What I mean is—does the physical formation of the country lend itself to the permanent conservation of water?—Yes, in parts certainly, because the ordinary little farm dam would prove that, where the water is retained as in a spoon.

790. You have some definite schemes in your mind's eye?—Yes.

791. In those definite schemes I suppose you recognise that you can carry out irrigation anywhere, but the question of carrying out payable irrigation is quite another matter?—Yes. Quite so.

792. What would be the value of land made ready for irrigation in the largest of these schemes you are speaking of?—They usually reckon that land—good deep land—is worth up to 50*l.* a morgen. That is about 25*l.* an acre. But I do not put that value on it myself. They reckon it is worth that before it has been put under a permanent crop, but I think it is from 20*l.* to 30*l.*—that would be the value per morgen.

793. What class of produce do you think could be grown? Would it be fruit or lucerne?—It all depends what your market demands. Soft fruit, for instance, I do not think would be a profitable crop to grow, because it has to travel so far by rail. But apples can be grown here and lucerne certainly in most parts, especially in the west. Every other crop grows, except tropical crops.

794. Are the schemes you have in mind so large that they would require to be carried out by some big authority, like the Government?—Yes, they are much too large for private individuals unless they co-operated, and even then they would want large capital, and there must be no one standing back.

795. **(Mr. Garnett.)** I suppose your scheme is to permanently dam up the rivers and store the storm-water?—Yes.

796. These dams would have to be placed at suitable spots, would they not, or they would close the drifts?—They might, but that is not a thing that would in any way inconvenience anyone. You could make a causeway or build a bridge if necessary.

797. The suggestion was that an almost necessary preliminary to any large scheme for damming the rivers was for suitable bridges to be erected at certain places to take the place of the drifts that would be closed?—I do not think that is always necessary, because the railway line runs right through the country, and in between the rivers most of the farmers can go to the railway without crossing.

798. But there would be places?—Yes, in certain places it may be necessary.

799. There was another consideration placed before us in evidence, and it was this: that while there are enormous areas suitable for irrigation, some of them are quite remote from railway communication, or speedy communication with the large consuming centres?—Yes.

800. And the argument was that it was not much use irrigating those unless *pari passu* railway communication was made into those districts?—That is not very much the case in the Free State except in the Hoopstad District.

801. But as a general proposition in South Africa?—It would probably apply in parts of South Africa.

802. **(Chairman.)** You say that the western portion of the Province is getting drier?—Both the western and eastern portions, but the effect is felt more in the west because of the lower rainfall.

803. What effect does that have on the value of land?—Land has risen in value all the same on account of the demand being greater and there being no land obtainable, but it is not as good a farming proposition to-day as it was thirty or forty years ago.

NATAL.

Durban, Monday, 23rd March 1914.

Mr. Maurice Smethurst Evans, C.M.G., called and examined.

(*For the evidence of this witness on "Mining," see p. 24 of* [*Cd.* 7707].)

804. **(Chairman.)** We are indebted to you for having prepared this memorandum, and I think that the most convenient course would be for you to read it?—I must explain, in the first place, that when I prepared this statement I did not know how far your terms of reference would include points such as I have raised here, but I felt that if you were going to deal with production in this country, either agricultural, or manufacturing, or mining, this question of labour is one that goes to the root of the whole question.

805. It is a matter for you to decide whether you prefer to read the memorandum or explain your views to the Commission verbally?—The memorandum will be valuable for the members of the Commission to read if they like afterwards, and if I could be allowed to put my views in a different form now, I think it would be the better way.

The following is the memorandum prepared by the witness:—

It will be impossible for the members of the Dominions Royal Commission to fully grasp the economic conditions of the Union of South Africa without understanding and taking into the fullest consideration the peculiar racial and social conditions of the country. Any comparison of our present economic condition and the future of the Union with the other great self-governing Colonies would be entirely misleading without such knowledge, and much of the present confusion of ideas is due to a lack of comprehension of these conditions. It is also necessary to note that, although every section of the Union differs from Australia, Canada, and New Zealand, conditions here are not uniform. In the Western Province of the Cape the social and, consequently, the economic position is quite different to that obtaining in Natal or the Transvaal. There we find a large coloured population of mixed blood undertaking practically all the manual labour and much of the skilled work both in town and country, and taking the position here held by the aboriginal native and the Asiatic immigrant. As I take it that the Commissioners have familiarised themselves with the position in that Province, I do not intend to dwell upon it, but will confine my remarks to that section of South Africa served commercially by the Port of Durban and including Natal, Griqualand East, the Eastern Free State, and the greater portion of the Transvaal, including the Witwatersrand.

The outstanding social and economic feature of this section is that the population is predominantly of the native or Bantu race, and that almost all of the manual and menial labour is done by them; of secondary but great moment, that there is in Natal an Indian population outnumbering the whites by about 50 per cent. In commercial life, in agriculture, manufactures, mining, and transport, this factor is the feature which must be remembered and investigated before correct conclusions and comparisons are possible.

In commercial pursuits the native fills the simple but essential rôle of customer, and the trade done with them is large and lucrative. There are practically no natives engaged in business. The wholesale trade is for the greater part in the hands of Europeans, though Indian wholesale houses importing direct on a smaller scale are numerous. The larger part of the retail trade with natives is done by Mahomedans from Bombay, who must be distinguished from the Indian coolie and his descendants. These Bombay storekeepers freely obtain credit from European houses.

In general agriculture the native, together with comparatively few Indians, is the labourer. With the exception of a few Germans and fewer Norwegians, no white man undertakes the actual work of the farm. Wages are low: where the native lives on the farm an able-bodied man will receive 10*s.* to 20*s.* per month with simple food, when not resident 10*s.* to 30*s.* Compared with Australia, Canada, and New Zealand this is, of course, absurdly low. I found, when in New Zealand some years ago, that during harvest time the labourers were receiving 10*s.* a day and three meat meals. Yet large quantities of all farm produce are constantly imported and the question is often asked, how is it, with cheap land, ample sunshine, a fair rainfall, and such extremely low-priced labour, South Africa cannot export farm produce, but is dependent upon countries in which land is higher in price and labour is paid from five to ten times as much?

The investigations of the Commission will have already shown them that manufacturing in South Africa is yet in embryo as compared with the other Colonies. In the manufactures already established conditions vary greatly, but, speaking generally, a considerable number of coloured, Asiatic, and native workers are employed.

The Economic Commission, of which I had the honour of being a member, found that employers who imported European labour often complained that the efficiency of such labour was distinctly below that of the same class in Europe. How far this may be due to climatic conditions or our peculiar social environment is an open question, but, in my opinion, this latter factor has a distinct bearing on the question. The wages usually paid to these Europeans are very much higher than in Europe, but this is balanced to some extent by low-priced coloured or native labour. How far it is possible for South Africa, under these circumstances, to compete with countries having trained workers living under industrial conditions remains yet to be seen.

The actual work of hewing the rock in mining operations is exclusively left to the black workers. The white miner is a supervisor setting out the work and controlling the machinery and explosives. Much discussion has ensued, and very varying statements been made, as to whether it is economically possible to employ white workers exclusively. I submit though that, at this stage in the economic history of the sub-continent, it is not so much a question of what is possible if social conditions were different, but what is possible under existing social conditions, and it does not seem at all probable that the white man is likely to displace the native in actual mining work.

The skilled trades, such as building and engineering, are still largely in the hands of the white man—almost exclusively so in the towns—and his wages are very high indeed. In no country in the world are actual money wages in these trades so high as in South Africa, and even when costs of living are brought into account we find the real wages at the Witwatersrand higher than anywhere else, and at least as high throughout South Africa as in any other country.

This is one factor in the extremely high cost of living which prevails in the Union, and which must be borne in mind when the possibilities of industrial expansion are considered.

The effects of these social conditions permeate the whole life of South Africa, but it is impossible here to trace them to their ultimate results, and how they will affect the future of the country. I may, however, be permitted to refer to the question of white immigration. Many enthusiasts predict the time when South Africa will be the home of a white population comparable at least with Australia, and

even quote the United States as an example (it will be possible) for us to emulate.

The history of the past does not lend much encouragement to this view nor do the statistics of late years. The term "a white man's country" is used to describe the goal of our ambition, and immigration on a large scale the means to attain it. I think it is possible that we may increase our white population gradually by immigration, but they will not be the class who have helped so largely to develop the natural resources of the United States, to people Canada, and augment the population of Australasia. These consist, for the most part, of those willing and able to work with their hands, and who, in those countries, can command a living wage by manual labour. Experience elsewhere, notably in the Southern States of the American Union as well as what we see in South Africa, goes to show that this class will not immigrate to a country in which they have to compete with low-priced black labour. The immigrants we will get will be a comparatively small class of superior artisans to fill the gaps created, men with capital fitted to supervise low-priced labour in agriculture and, to a certain extent, manufactures, and those engaged in commercial pursuits.

It does not follow that South Africa will not develop and grow great on different lines. There are great possibilities in the country, and the increasing efficiency of native labour, improved methods in agriculture, the development of mining, and some progress in manufacturing will gradually make places for an increased white population fitted to take the higher posts. Concurrently with this the gradual improvement in quality of native labour with higher wages and spending power will help materially in economic advance.

But South Africa will always be a white and black country, and only by recognising this fact and suiting our actions to our circumstances can we attain what is possible to us.

806. **(Chairman.)** We shall be glad to hear your views?—My view was that the Commission after having been to other white countries such as Australia and New Zealand, if they came here, and I speak now for the centre of which Durban is regarded as the port only, without having a grasp of our social conditions, particularly our labour conditions, they could not make proper comparisons with the conditions obtaining in other self-governing Colonies. This question of the labour of the country enters into all matters affecting production in South Africa. Some years ago I visited New Zealand, for instance, and I found there that the agricultural labourer was paid something like five times as much as our farmers pay to the ordinary native labourer. Now that is a factor that cannot be ignored if we are to compare the production of general agricultural products in this country with another country like New Zealand. In commerce, also, the native is a customer, and although not a factor in competition he comes into the question again. In the mines, as you know, the whole of the actual labour for years has been done by the native, and the white miner is simply a supervisor. Then there was another particular point that you reported upon in New Zealand—that of immigration. If you are going to deal with immigration in this country, you must first and foremost recognise the fact that the whole of the manual labour in South Africa is done by the native, whereas the emigrant who goes to Australia, or New Zealand, or the United States and Canada, is largely a man who is going to work with his hands. Now there is no opening for that kind of immigrant in this country. If he comes here willing to work it must be to compete with the native. Take my own position, for instance, as a householder having a garden. I should have to employ one or two white men if I was in a country like Australia or New Zealand. I now employ natives instead, and if a white man comes along who is willing to work and do the manual labour, it means that my present small staff of natives is going to be disorganised. I would have to give that man a wage that would bear some relation to what I was paying the natives, and, in fact, there is no open ing for him; and so it is right through the piece. The white man is the supervisor of the ordinary native labourer and not the actual worker concerned. So if you are going to deal with this question of immigration in South Africa as you dealt with it in Australia, this fact must be borne in mind, because it goes right to the root of the whole matter. Might I say here that the year before last I travelled in the Southern States of America, and I found there that the great stream of immigrants into the United States, mainly, of course, from east and south-east Europe, was all going to the north and west and mainly into the cities, and that none of these people ever went to the south, that is, to the country in which the negro does most of the manual labour. They simply avoid it. Some years ago an attempt was made to induce them to go into South Carolina, and the State of South Carolina sent representatives to Europe to persuade immigrants there. They got a couple of steamship loads and the immigrants on arrival were fêted at Charlestown and received a hearty welcome, but in a year or two they disappeared elsewhere. They did not stay in the South and enter into competition with the negro in manual labour; and so I think it is in South Africa to-day, at all events in the country of which Durban is a port. I am not speaking for the Western Province; no doubt you found peculiar conditions there, where the coloured man takes the place of our native to a large extent. But speaking of south-east Africa, Natal, and Zululand, eastern Free State, and the eastern Transvaal, and the Transkei territories, the conditions are, I should say, that the white man has a great opportunity as a supervisor in many branches of skilled work and also in commerce, but not in manual labour; and the manual labourer, after all, forms the bulk of the people who are going to the other Colonies of the Empire.

807. Now you say that immigration on the lines of that to Australia and Canada is impossible here. Do you look forward to any immigration at all?—Yes.

808. What kind?—For instance, on the land, there is an opening here for the educated young fellow who is in a position to supervise and teach native labour and take advantage of it. I think for such a fellow as that, with training in farming, this country offers quite as good opportunities as any country in the world. Land is comparatively cheap; he need not do the manual labour himself; if he has the gift of getting the best out of the native labourer I think there is a very good opening here.

809. Will you give a little more detail on the point of the immigration you think possible and desirable. In the first place, would the man you have in mind need to come with or without capital?—With capital. I think he must have capital, but the amount of capital depends largely upon the character of the man himself. It need not be very much if the young fellow is of the right kind, but he should have some.

810. How would he get the necessary experience of local conditions before setting up for himself?—He could find a place with some other farmer already in the country. He would not get much in the way of remuneration until he had learned the native language, and could act as supervisor, because he would not be of very much use. The farmer would probably allow him to do a certain amount of manual work, and then he would be of more use as a supervisor. He could get the necessary training in the country.

811. Do you consider experience of local conditions essential before a man launches out for himself?—Absolutely essential, more so in this country than in any other.

812. How long a training does that involve?—Eighteen months to two years would be desirable.

813. What amount of previous agricultural training should he have before coming out to this country. You may possibly be aware the view has been taken in Australasia that agricultural training of an extended kind under conditions such as obtained in the Mother Country, so far from being beneficial, is rather harmful, because such a man has a great deal to unlearn, as well as to learn. What have you to say on that point?—I think that a very elaborate training in other con-

ditions would be a mistake. A knowledge of the principles that underlie all agriculture would be valuable, but any man coming from Great Britain or any of the other Colonies to this country would have a great deal to learn. Apart from climatic differences, there is this great question of employing native labour.

814. Does any agricultural college exist here which would give the beginner all the necessary knowledge?—Oh, yes, the Agricultural Department of the Union have several colleges. Here in Natal we have one in the midlands.

815. Is that suitable to the young emigrant coming into this country, or is it designed mainly or solely for the local-born individual?—The idea was to train the local-born man, but I should say that anyone coming from over-sea whose mind was set on farming, and who was of a proper type, would find a great deal of useful training in that institution.

816. What is the charge?—I forget exactly what it is, but it is quite reasonable; speaking from memory, it is about 40*l*. a year.

817. From your knowledge, have any immigrants from over-sea gone to any of these colleges?—I do not know whether you would call them immigrants, the men from oversea, but they are not all Colonial-born who go there.

818. You say that wages in New Zealand, when you visited the country, were five times as much as the wages paid to the natives here?—I said so, speaking generally. I was at New Zealand at harvest time, and in the province of Timaru, the man I was staying with was paying 10*s*. a day, with three meals, for harvestmen. Well, now, in this country, the arrangement made with natives includes tenancy of the land, very often, so you cannot compare them in the same way. The native here is very often a tenant on the land, and has a kraal site when working for the farmer, and he would probably receive an average wage of something like 15*s*. a month.

819. What is the comparative efficiency measured by work done?—That is a very difficult thing to say, but there are natives remaining in the same service under the same man for many years. That man teaches them and makes very efficient workers of them. Many farmers will tell you that these natives are quite as good as white men. Of course, they vary very much, but it is quite possible, with right handling, to get very efficient work out of the native. He must, however, be well looked after and not left too much to take the initiative. He must be shown how to do things.

820. You state in your memorandum that South Africa will always be a black and white country. What precisely do you mean by that?—Well, sir, politicians talk about this being a white man's country, they do not define it very clearly.

821. What do they mean?—I do not know. But one thing I am certain of, and that is that the black man is going to remain in this country, and he is going to have the largest share of the manual labour which is done in this country, and still I feel also that there is an opening for the white man, if the white man will be a white man, and act up to the best traditions of his race. There is room for both.

822. Do you look forward to a gradual improvement in the ability and capacity of native labour?—I do; it has shown itself already. If you discuss the matter with people who work with native labour on the land, they will tell you that some of it is very efficient.

823. It is increasingly efficient?—Yes, increasingly efficient. But you have to discriminate there. A native may be exceedingly efficient on a job after you have shown him how to do it, and he may do it even with judgment and follow exactly what he is shown, but I do not think that the native is fitted to take control of a large number of men. I do not think he is fitted to do two or three things at the same time. There are racial limitations to the native, and they do not include the ability to supervise and originate, but they do include the ability to do a certain set task admirably and efficiently.

824. And you think that inevitably the sphere of the native will enlarge?—It must do.

825. You think that is almost a necessary consequence of the facts?—It must be.

826. **(Sir Alfred Bateman.)** There is only one question that I would like to ask, and that is from a statistical point of view. I have not been able to find any satisfactory statistics of the numbers of the native races. Have you formed any impressions in regard to Natal, as to the proportionate increase of the two races?—The last census returns would give that, the one for 1904 and the one for 1911. This return will give you the actual figures and show the increase.

827. These figures for the natives are not very satisfactory?—They are not very complete, they only give you a general idea.

828. It is very general indeed, and it is difficult to say, if you exclude the big reserves and the areas set apart for natives; it looks as if the white race is going ahead a little bit more than the native?—Yes. I think that is correct. There is a certain increase of whites by immigration. The natives increase enormously in an open country, as, for instance, in Basutoland. In the early days, according to figures, they doubled their numbers in ninteen years, and in Natal in the early days when Chaka had swept the land and left it empty, the refugees who came in increased enormously, but they are not going to increase in the future as they have done in the past. They are very prolific, but the conditions are not so suitable. The land is getting filled up, and they have not the same room that they had.

829. Will their birth-rate follow the tendency in all civilised countries, that is, to diminish?—No, the babies will be born, but they will not live.

830. Do you think then that infantile mortality will increase?—Yes. The native will never keep down the birth-rate consciously and willingly, but the conditions will not be so favourable. In the olden times they had any amount of cattle, and the lives they lived were idle and healthy, but now they are getting more crowded, and many of them come out to work in industrial centres, and the conditions generally are not so good, so that infantile mortality up to a certain point is going to increase.

831. Do you contemplate that in another generation's time the proportions of the two races will be different from what they are now—natives and whites? Will the proportion of whites be less?—No, I do not think so, I think it will keep much about the same.

832. **(Mr. Campbell.)** In regard to the immigrants of whom you speak—the possible immigrants—could you give me any general idea as to what minimum capital would be required to start a man farming here?—Not a great deal to begin in a small way.

833. Would 500*l*. be sufficient?—Yes, but that should be the minimum. If the man leased the land, and put his back into it, 500*l*. would be sufficient. Our seasons are very uncertain, you must remember.

834. You say there is a certain amount of gambling attached to it?—Yes.

835. Is there any Crown land in Natal available for settlement?—There is not now a large quantity, and what there is is mostly in inaccessible parts. You cannot look to the Crown land to settle many people on. The old Natal Government expropriated areas of good land, and divided them up and sold them. I do not think there is any of that land left, or very little, and the original Crown lands are in the more inaccessible parts.

836. You do not think there is any advantage in any set scheme for the expropriation of land?—Yes, I think so. I think the Government might expropriate. They could not do it on a very large scale, but they might settle a good number of people on the land by wise expropriation. Mind you, they would all want native labour. The only people who did not use native labour were the original German immigrants in their early stages. They did practically all the work themselves, but as a rule, whenever they get more prosperous, and when the sons grow up, they want native labour.

837. Now, as to a scheme to attract immigrants here—I suppose they are not coming in any quantity?—Last

year the numbers coming into the country exceeded those going out by 380.

838. What would be the class that came in? Would they be people going to take up land?—A certain number. They come for commerce, and a few skilled artisans; but a certain number would go on the land. As a rule, those who come and go on to the land are young fellows who have some money.

839. Could you suggest any scheme by which immigration of that sort could be encouraged and popularised?—I think myself that the scheme I understand is in operation in New Zealand of introducing boys might suit here. I have seen notes of it in the "United Empire Magazine" from time to time. Poor boys were introduced and given to farmers under regulation, and I hear that it has been quite successful. I do not see why a certain number of boys of that class should not be introduced here. I think farmers would be willing to take them, boys, say, 14 or 15 years of age, who would gradually grow up on the farm and learn the native language, and in time take up farms for themselves. I think myself that is perhaps the most hopeful line. Young fellows with capital are going away to East Africa, America, Australia, and New Zealand, and we want to attract as many of these as possible, and I think the chances are as good here as anywhere. I know something about East Africa, and I think the chances in South Africa are quite as good as there, newer country though it is; but next to those I think the boy is the best.

840. But would the boy immigration scheme be possible here, seeing that farming here requires considerable capital?—They grow up on the farm, and are taught by the farmer, and they learn the native tongue and how to handle the native labourers. At first they would do odd jobs on the farm, and then gradually get to learn all about the work of farming on South African lines, and after a time the farmer would use them as supervisors. With this training they would not only learn the work of farming, but be able at any time to get employment as overseers, or take up land for themselves.

841. In order to offer attractions to young men with capital, would you advocate a scheme of resumption of private lands by the State for the settlement of such people?—Yes.

842. And there is a good opportunity in this country for such resumption?—Yes.

843. What is the average price of land in Natal—of ordinary good land, say, for the standard form of agriculture or sugar-growing, and so on?—You must not confuse sugar-growing with general farming. As for general farm land, ten miles from the railway—unimproved, healthy for stock, and with a fair proportion of arable land, I should say 2*l.* an acre.

844. And there is a fair quantity of such land available not being put to full uses?—Yes, it is privately-owned and not being fully used.

845. Would it cost a great deal to acquire and improve it?—No, it is all grass land. It would require fencing, but a man could put his stock on it shortly after purchase.

846. Would it be fit for cultivation?—There would be a certain proportion of arable land. It would not be all arable. I should say an average place would be 10 per cent. arable, and the rest would be quite suitable for grazing.

847. **(Mr. Tatlow.)** What about the sons of the farmers? Do you not think, as they grow up, they would provide sufficient white supervision for the farmer?—They would provide a good deal. I am not advocating a large number of boys.

848. Does the farmer have a large family here as a rule?—The Dutch farmers certainly have, but in Natal, where the farmers are principally English, the families are fair. I should think they are larger than townspeople have.

849. Then to a considerable extent the farmer does provide supervision by means of his sons, as they grow up?—Yes.

850. When he does grow up, to what does the son of the farmer usually turn his attention if he does not remain on his farm?—They usually go farming, and they are the best supervisors.

851. You said that any young man coming out here to settle on the land would require to have a capital of not less than 500*l.*—that he should not think of starting on less. That, I presume, is not until he had served as a supervisor?—Yes, that is my opinion, certainly.

852. But are there openings for many overseers?—Not for very many. But for a good number of the right sort. A man who has a knowledge of farming in this country, who understands natives and can manage them, can always get a job here.

853. You advocated sending out boys to work on farms. But they would not have capital, and they would not be paid at such a large remuneration as in Australia and New Zealand, so they could not save much money. What would their chances be of acquiring land? In Australia and New Zealand I think their wages would be about 15*s.* a week and their keep, and the greater part is put by for them, and when they grow up they have sufficient capital to go farming themselves?—Up to 14 or 15 they would not get 3*l.* a month here, but by the time they had a knowledge of their work and could manage natives, they would get more. I do not see why a boy here after he had got used to the country and its peculiar conditions should not get more than in Australia as a farm labourer, because in this country he is a supervisor of other labourers. As a manual labourer he could not hope to do it; but as a supervisor of others, yes. But this only applies, of course, to a limited number of boys; you could not import thousands or hundreds at once.

854. But to a limited number you think there is a fair prospect?—I think so, certainly.

855. **(Mr. Sinclair.)** In whose occupation are these lands that you suggest might be made available for young men coming here with a certain amount of capital?—A certain number of farms are held by absentee landlords—land companies. A farmer, for instance, will have two or three farms. He may live on one, and it is no uncommon practice to devote another entirely to labour. The natives are tenants on this farm, and pay a small rent, while they are under an obligation to come out and work for him when required on the farm on which he resides. These lands are held in these different kinds of ways, which might gradually be expropriated, though perhaps not to any very great extent.

856. Then it would not involve depriving the sons of those who farm these lands from getting their share later on?—No.

857. There are lands held by companies who are absentees?—Yes.

858. And there are areas that are not worked by the actual owner, but are let by him to natives?—Yes.

859. First: as regards the companies who are absentees, are large areas of land held in this State by them?—I have never actually tabulated it, or gone into the question closely, but one or two companies are holding large quantities of land. They have gradually sold some, but they still hold large quantities.

860. Was that land taken up primarily for the purposes of production, and, secondly, with the object of cutting it up by way of speculation?—Do you mean taken up by the original company?

861. Yes.—I think it was taken up largely for speculation. One of these companies is the Natal Land and Colonisation Company—an old company.

862. Is there much of this land available that might be used for settlement under a scheme such as you have suggested?—Yes, there is a fair quantity.

863. Are many farms owned and let instead of being worked by the owners?—Yes, a good many are let to natives, of course. There are not many let to white people.

864. There is no system in operation under which young settlers with a certain amount of capital are sought for, is there?—The late Natal Government, as I said, expropriated a certain quantity of land and cut it up and gave it to suitable farmers. There was quite

a good demand. The result was quite satisfactory on the whole.

865. Was that land taken up by those who were already in the country, or by outsiders?—There was a demand for all of it in South Africa.

866. Then there is a demand for land by your own people—by those who are already in the country?—Yes, and I may say that a very large proportion—a much larger proportion than in the past—of the sons of townsmen who go on the land. We have some very good farmers who are the sons of people who followed the profession of commerce in the towns, and there appears to be an increasing desire.

867. And in face of that desire do you think there is also room for the outsider to come in?—Yes, with some capital.

868. The competition between those two classes of men may result in the price of land going up?—Yes.

869. You spoke about boys. Do not you think that boys of the class that we are taking to New Zealand would here necessarily come into competition with cheap labour, having regard to the class from which they come?—I have known boys brought here of the poorer class, and if they get into good hands they have done well. They are white men after all, and they get the status of a white man. The white man takes a higher status here than in an all-white country, because he is a white man, but they have to learn the native tongue, and how to handle the native. I am quite against the introduction of immigrants of a low stamp, but I think boys who fell into good hands such as those would do well.

870. You spoke of the high wages that are paid in New Zealand. Did you say that the time was about harvest?—Yes, of course, they do not get that all the year round.

871. That was a special season?—Yes.

872. And you found that the cost and the standard of living were high?—I was there ten years ago, and, as compared with South Africa, I did not think the cost of living was high. The standard of living was certainly high.

873. When you say the cost of living was not high, are you referring to your recent visit, or ten years ago?—Ten years ago; I have not been there since then.

874. You know that all over the world the cost of living has gone up in recent years?—Yes, but at that time the cost of living in New Zealand as compared with this country was low.

875. But not low, I take it, when you compare the class of farm worker in New Zealand and the native who does the work here?—The farm labourer there lived on three meat meals a day. Our native here lives on three turns of mealie porridge a day.

876. Exactly. So that you can scarcely make a comparison between the cost of living in New Zealand ten years ago and the cost here?—I mean the cost of living among white people.

877. But we are comparing the cost of living of the white worker on the land in New Zealand with the cost of living of a white man on the land in South Africa?—No, I was speaking of the general cost of living in town and country, all over.

878. Are you getting, under existing conditions, any or many young settlers from outside with capital to take up land?—Not a great many.

879. You are getting some, but not many?—Yes, it is generally those who have friends here or some connection, or something to attract their notice to the country.

880. **(Sir Jan Langerman.)** Talking about the immigrants coming with capital and boys, in regard to the capital you say that those with capital could go elsewhere if they liked?—Yes.

881. You say that land costs 2*l.* an acre?—Yes.

882. How does the cost of land in other parts where they could go to compare with 2*l.* an acre here?—You mean to say in Australia or New Zealand?

883. Yes, or Canada or America.—I am not sufficiently familiar with the prices of land in those countries to be able to make a comparison.

884. Do you not think that the price of 2*l.* an acre which the newcomer would have to pay here would militate against his coming here, because they would be able to get land cheaper elsewhere?—I said I did not know the prices of land in these other countries. But I have a certain amount of knowledge and have formed certain ideas, and my idea is that land in South Africa is cheaper on its intrinsic merits than it is in most other big Colonies.

885. That is, given that the land falls into the hands of an experienced person, and not into the hands of a man who has to learn his experience yet?—Yes, he must be an experienced person to get the value out of the land. But, taking into account what you can produce, the land is cheaper in South Africa than in any other big Colony—that is my idea.

886. It has been pointed out that in regard to the boy who has served his apprenticeship to a farmer, his pay would be so low that he could not save sufficient money to acquire land; but is not the land law of this country easy to get land for anyone experienced in farming?—We have the Land Bank.

887. Did not the Government pass a law two years ago whereby a man can acquire land by putting up one fifth of the purchase price and paying the rest in twenty years?—Yes, the terms are easy.

888. Do you not think those are very easy terms for acquiring land by one who wishes to farm and has experience of this country?—Yes.

889. So there would be a good future for those boys who came out if they stuck to their work?—Yes.

890. In regard to white labour coming into competition with black, you mentioned America, where the white immigrant avoided the Southern States. Is not the same true of India; do you find white labour going to India, or the Malay States, or Ceylon, or the West Indies?—No.

891. White people do not go where black labour exists?—No.

892. So, therefore, there is nothing unique in South Africa?—No. The white man cannot compete with the black man.

893. Because, I take it, our whole economic system from the earliest days of our South African Colonies has been based upon black labour?—Yes. It is no use flying in the face of facts. There they are.

894. **(Mr. Lorimer.)** In this very interesting memorandum of yours there occurs this paragraph: "Large "quantities of all farm produce are constantly imported, "and the question is often asked:—How is it, with "cheap land, ample sunshine, a fair rainfall, and such "extremely low-priced labour, South Africa cannot "export farm produce, but is dependent upon countries "in which land is higher in price and labour is paid "from five to ten times as much?" Now does the relation of the population to the imports of food remain fairly constant?—I have never analysed them, but we are at present, as the commercial witnesses will tell you, importing very large quantities of all kinds of farming produce that we profess to raise in the country, even with only one and a quarter million of white consumers.

895. I want to ask whether the larger experience which these natives acquire on farms tends to increase their production?—Yes, the native is getting a great deal better farm labourer than formerly, and certainly the farmer in South Africa is getting to be a better farmer. We are importing and exporting larger quantities of stuff from the land than we did.

896. The exports are increasing?—Yes.

897. But if you continue to import the same quantities of food as before, is it because you are not increasing the agricultural production?—No, I think the agricultural produce consumed in the country is greater than it was. We are improving, but we are only improving slowly, and what I say, therefore, is perfectly true, that notwithstanding our favourable position—cheap land, cheap labour, plenty of sunshine, and a fair rainfall—we are still having stuff coming into the country that is produced on high-priced land with high-priced labour, and it is knocking us out.

898. And the object of my question was to ascertain whether you have really effective labour in that cheap labour?—Well, sir, it has its advantages and its disadvantages. I believe that in a country in which

you have low-priced inefficient labour it has a tendency to lower the standard of production in that country.

899. You said to one of the members of the Commission that natives have been known to make almost as good labourers as white men. Is that agricultural labourers, or are you speaking of general industries?—I was speaking particularly of agriculture.

900. Would that man's wages be increased because he was a better workman than the average?—Usually only slightly. He does not demand it. He does not realise that he is so much a better labourer than the other man. He realises he is a native, and that is all. It is not quite the same case as that of white men.

901. I do not know much about agriculture myself, but as a manufacturer I think I can say this, that high wages are generally cheap wages?—Yes.

902. You have the black man here, and you cannot get rid of him, and the black remains the dominant population, in respect of numbers at any rate; now, would it not be a wise policy on the part of the Government, or the authorities concerned, to endeavour to develop this man's capacity?—Yes, if you can be sure that there is a field for that increased capacity.

903. You cannot get rid of these men—they are there for all time, and the relation of the white man to the native is, no doubt, a difficult one, but you certainly make the best of the country, I should think, and make the best of them if you make them more productive?—I have not the slightest doubt that, as regards agriculture, that is on the right lines. I should make the native as productive as possible, but we ought not to forget that, if we train them industrially in trades, we have to reckon with competition with the white man, and that is a matter that calls for very serious attention. If you could train them industrially to work among their own people, there is no doubt about that being right, but if you are going to train a large number industrially, and then bring them into the towns or industrial centres, they are going to compete with the white man, and then you are not only going to have industrial troubles, but labour troubles plus racial troubles.

904. I realise how perplexing it is, but there is the fact, from which you cannot get away; and what is the best way to deal with it? Has there ever been any opportunity of comparing the work of a white man with that of the native under absolutely similar conditions?—Yes, there have been a good many experiments made here with varying results. The Government have employed gangs of white men on construction work, on the railways, both piece-work and day-work; and certain mines at Johannesburg have employed white men and tried to make a comparison between their work and that of the native, but I may say that these results vary very greatly. One man will tell you that the white man has shown himself capable of doing manual work economically as against the black, and another will tell you that he has failed. As a matter of fact, I think that in purely mechanical, physical work, for instance, the filling of trucks all day with sand, the white man could not economically face the black man, but there is a good deal of work in which initiative and intelligence come in, that is not skilled work in the common sense of the term, and there, I think, particularly if he is on piece-work, the white man has a chance.

905. You speak here of the report of the Economic Commission on the imported European labour and its effect on the other. But while you are in doubt as to what the effect of that may be in the development of industries, I think you have to bear in mind that there is an element in that question which is altogether apart from the character of the men you employ. Nowadays, when you have industrial organisation on a scale of such magnitude as obtains in the United States and in England, you can hardly expect, no matter how you develop your population here, to be in a position to compete with this organisation and these highly organised industries elsewhere; do you not think so?—Well, we have not done it so far, on a large scale, but I do not see why it should not be done in certain industries—those in which the native could be employed at purely mechanical tasks.

906. One moment; when you use the term "mechanical," do you mean manual or skilled labour?—No, I mean unskilled. I mean mechanical in the sense of doing the same thing over again and again—not mechanical in the sense of using machinery. In industries that could properly utilise native labour I do not see why there should not be a great advance.

907. The impression this report left on my mind was that as you have a race of men here whom you cannot get rid of whether you may wish to do so or not, it is a question whether the development of the country might not be greatly furthered by increasing the efficiency of these people?—I agree with you in general terms.

908. **(Sir Alfred Bateman.)** In regard to that question which you ask in your memorandum, and to which Mr. Lorimer has already referred, is not the reason for your importations of farm produce a purely economic one, namely, that the food you import costs less than what you could produce it for here, while you are employed in making or exporting something which pays you better?—That would be a partial answer.

909. And the rest?—I think one factor is that we do not farm as well under our conditions here. The abundance of low-priced labour tends to slacken us in production.

Pietermaritzburg, Friday, 27th March 1914.

Mr. J. Marwick, Vice-President; Mr. S. B. Woollatt, Member Executive Committee; Rev. James Scott, Member Executive Committee; and Mr. Duncan MacIntyre Eadie, Secretary, of the Natal Agricultural Union; called and examined.

(For the evidence of these witnesses on "Animal and Agricultural Produce," see p. 238.)

910. **(Sir Alfred Bateman to Mr. Scott.)** I understand that you have to leave early, and would like to be examined first. Would you wish to make a statement?—Well, I was not prepared to make a statement, but I would like to give my opinions. I have had a considerable amount of experience, nearly 64 years now. I consider that South Africa is very favourably situated for settlement if we can get the right sort of men. But, unfortunately, we get a good many who are not of the right sort. We want men who will work both with their hands and their brains. We have men who work with their hands and not with their brains, and on the other hand, we have men who do not work with their hands. I feel that we could take into this Colony of Natal a few hundreds every year of the right sort, with great advantage to themselves and to the Colony also.

911. They would superintend the native labour?—They would gradually come to that.

912. Would they work with the native in manual labour on the land?—Well, every man who is to succeed in Natal or in South Africa generally must be able to work with the native—to guide and direct the native. He must have a knowledge of the work that he has to guide the native to do. That is the kind of man who will succeed on the farms in this country—the man who can guide the native, and get on with the native, who does not knock him about and ill-treat him

and drive him away, but who knows how to get a fair day's work out of him. That is the kind of man we want in South Africa, and in Natal particularly.

913. What class of man would this be?—I should say he should be recruited from the agricultural class—the working farm class—the farm labourer with a little education.

914. What you want are rather picked people?—I suppose we are like every other country in the world. Those are the men who get on.

915. We have been told that there is a demand for boys from outside—that boys of the best class from the towns would be able to work up to that kind of thing?—In regard to such as have been brought out, a percentage do well and a considerable percentage do not do well. But we have seen some of those young lads come out and do very well.

916. **(Sir Rider Haggard.)** Are people in this part of South Africa going out of the towns to settle on the land, or coming from the land into the towns?—I do not think the movement is very decided either way.

917. The towns are, many of them, agricultural towns?—Yes. There are always a few, especially with one class of people, who are very apt, when they reach middle age, to take up town houses. The Dutch are very fond of leaving their farms to their children and settling in town. There are many cases of that.

918. You talked of the "right sort of man" whom you wished to see emigrate here: I understand you to mean the typical agricultural labourer?—That is so.

919. Are you aware that that class is rather short at home?—Yes, I saw that recently. I have just returned from home. I was there last summer. I was on the farms a good deal, and I saw that the very men I wanted were not at all over plentiful.

920. In fact, I am afraid you want to draw water out of a dry well. Would you not want a man with capital?—No, I think not. I think the man coming out to start farming in Natal generally loses his capital before he has been long at it. But men who have come with no capital, and have worked hard and got experience, have done well.

921. You prefer the man without capital?—With very little indeed. But if he has capital, he should invest it, not in farming, but in the bank, or in sound securities, and use it when he has the needful experience.

922. How about the value of land—is it rising?—Yes. From the time I can first remember, the land has risen exceedingly in value. For instance, the price of land in the Klip River district in my early days was 6*d.* per acre. I can remember a farm being sold at that figure, belonging to John Allison, and I suppose you would not get that farm to-day for less than 5*l.* an acre.

923. Is that 5*l.* the ordinary price of land to-day?—Only for the best farming land, except on the coast—the choice parts, it is above that—but from 2*l.* to 5*l.* an acre, I should say, with 1*l.* for the very rough land.

924. Is it easy to make land pay that costs 5*l.* an acre?—Well, with wattle bark at the prices it was a few years ago, it would pay at 5*l.*, but I doubt if it will to-day; 3*l.* is now more about the value of wattle bark land.

925. Wattle bark land will grow other crops too, will it not?—No, it will not. It will do for grazing, but it is generally land on the bush veldt which is too wet for mealie-growing. It grows some things fairly well, but the best wattle land is not considered to be very payable land for other crops.

926. Then it is very inferior land?—To my belief it is. It is not equal to the low veldt land, where you can grow food crops if you get moisture enough. But the thorn valleys of Natal, as you know, are generally short of rain. But the high hills which catch the rain grow the wattles best, and although the wattle likes a good soil it will grow in a poor soil.

927. It comes to this, then, that land which is inferior is worth 3*l.* an acre?—If close to the railway.

928. And at that rate, what is land which is not inferior worth—the best land?—Some of the best mealie-growing land you will hardly get at 5*l.* an acre. There has been some land sold lately at 5*l.* I have known some go to even 7*l.* and 8*l.* an acre.

929. Does it pay at that great price?—No.

930. In other words, the price of land has been inflated beyond its productive capacity?—Yes. It goes up and down. But in my time it has gradually risen. It goes down, and then rises higher than ever it was before. For the last ten years, I may say there has been a distinct advance in the price of land.

931. Is that advance justified by the returns?—In some cases it is, and in many cases it is not. It has often been sold at an altogether fictitious value, and it could not bring in anything like interest on the money paid.

932. On the large sums charged for the fee simple?—Yes.

933. Then why do practical men give such prices?—They do not. They wait till the price goes down and then buy.

934. You mean, then, that it is the fools who are buying it at the high price?—I think so.

935. **(Mr. Sinclair.)** Did I understand you to say that in your opinion a man was not wise to give as much as 5*l.* an acre for farming land?—It is difficult to say, the advance has been so great in my lifetime that I cannot say whether it will not advance to 10*l.* in the next few years. I can only say that I should find a great difficulty in making it pay interest on that.

936. It does not seem a very high price?—No, it does not, but it would have to be very good land and very close to the railway to be worth that.

937. What would land at an intrinsic value of 5*l.* be capable of producing? What class of farming would you get the best results from?—It depends on how it is worked.

938. But taking the land that can be got at 5*l.* an acre, what can be done with it?—Some land at 5*l.* an acre would be good maize-growing land, and the only difficulty would be, of course, to have the rains at the proper season. If rain came at the proper season the land ought to produce a good crop of maize.

939. If maizes were a part of the crop then the ordinary climatic risks would have to be taken?—Yes.

940. Maize is one of the products?—Yes.

941. And what else?—Of course, on that particular ground where you grow the maize you cannot grow anything else for a year.

942. But I am speaking of mixed farming on land worth about 5*l.* an acre. You tell me that maize is one form of produce that can be grown on a part of it and that it either succeeds or fails, depending on the season?—Probably the farmer would also have cattle. He feeds the cattle on the grass portion of his farm during the summer months and turns them into the mealie stalks after the maize has been reaped during the winter.

943. In the vicinity of the town would not dairy farming be a profitable investment on land at 5*l.* an acre?—Well, I have a son-in-law who is dairying within five miles of Maritzburg, and he does not find it very profitable on land which has cost less than that. A living can certainly be made, but it is not so very profitable.

944. I was going to ask you for your opinion as to the general system of farming throughout Natal. Would you say that small farming is well conducted or otherwise?—That is a very difficult question to answer. It is in some places well conducted, and in others there is far too much polo playing and tennis playing to the neglect of the farms.

945. Then you would say that indifferent cultivation prevails to a great extent?—The European cultivator is generally a fairly good cultivator, but the native is generally very inferior.

946. As to the question of financial assistance which is given to farmers, do you find that the banks that carry on business in this district give reasonable facilities to farmers?—I think they do. Of course, you are aware that the Land Bank exists. I think that institution has been giving unreasonable facilities to farmers, which has had the result of ruining them instead of helping them. They do not spend the

money on their farms. It comes freely, and it goes freely, and to my mind it is a very bad system.

947. Is it not a system which, if well used and used for the purpose for which it was intended, would assist farmers to develop their lands, and be of great benefit to the country?—Yes, but unfortunately in many cases it has not been so used. The money has been used for other purposes than that of improving the farms.

948. Then as to labour, in default of men of the right sort coming here, who we all know are exceedingly scarce everywhere, do the sons of your own farmers work into the position of supervising native labour?—Some of them do.

949. But not in sufficient numbers?—No, the country could take a good many more. I believe that Natal itself could take hundreds every year.

950. And the advent of these numbers would not seriously conflict with the interests of your own men, I mean those who are born in the Province?—It would perhaps necessitate their doing a little more work and not having so much amusement.

951. It would afford a healthy stimulus?—Yes, it would be a useful stimulus to the farmers.

952. Is the discipline involved in the work which the coloured labourer has to submit to bringing him gradually into the position of being able to supervise labour?—In very rare cases will he ever be a good supervisor. Not for many generations to come. I have only known of one native who was able to supervise, and that was only because he was instructed by his white master, and made to do it.

953. **(Sir Alfred Bateman to Mr. Marwick.)** Have you anything to add to the views which Mr. Scott has expressed?—Yes. The question has been raised as to whether there is land available for farmers. I may mention that there are large quantities of land held in this Province by absentee owners for speculative purposes. I think that legislation should be passed to expropriate this land and make it available for emigrants or people who are already here.

954. Would that refer to a big land company like the Natal Land and Colonisation Company?—Certainly, the colonisation part of their title is altogether wrong.

955. I suppose that most of their land was bought a long time ago and they gave very little for it?—Yes.

956. They gave little for it and have had little out of it?—They have had the Kaffir rents out of it for a great number of years, and they have sold land for ten times what they gave for it.

957. I think I saw in a financial paper the other day that they only paid 7 per cent.?—I am aware they do not pay a great amount of interest, and they did not pay any interest for a long while, but they must have a big profit, or else there must have been a big leakage somewhere.

958. Then you think that a company of that kind is not in the best interests of agriculture?—No, they have been like a millstone round the neck of Natal.

959. Are there any other companies like that?—I am not aware of any companies, but there are any amount of private individuals.

960. Is there no legislation in the Union which discourages that?—In Natal there was an Act which enabled the Government to expropriate any land if they required it, and this Native Land Act, if it is stringently enforced, is going to hit these people pretty hard, and make these gentlemen part with a lot of their land.

961. How will that be done?—Under this Act they will not be allowed to charge rent to the natives, because, according to the Act, no rent is to be charged in money or kind, labour is to be the only return, and these people are not likely to keep the natives there if they are not allowed to charge rent.

962. I do not quite understand the provision. What land does it refer it?—To all private lands. It is proposed in a way to segregate the natives, and to help to do that they are going to prevent anybody who has natives on his land charging them rent. These natives are to be as servants, and if he cannot get sufficient return out of their labour those natives have to go somewhere else. **(Mr. Woollatt.)** Every native living on a European farm must work for 90 days a year, or the owner of the farm is liable.

963. Is that under the present Act?—It is under an Act passed but not yet in operation. That part of the Act is suspended while a commission is sitting to inquire into its operation.

964. It is something like the old system in Europe, the corvée?—Well, there is a lot of land owned by Europeans, and they have these natives as squatters, who pay rent to them. Under this new law they will not be allowed to have these squatters unless they keep them solely for their services in lieu of rent. Assuming a man has a farm with a lot of these natives as tenants, he will not know what to do with all this labour, so they will have to go elsewhere, and they will have to put the land to other uses. **(Mr. Scott.)** The Act is not retrospective. Those who have natives who are paying rent now can continue, and those natives can remain.

965. **(Sir Alfred Bateman.)** Is this Act in operation?—**(Mr. Marwick.)** It is not absolutely in operation. **(Mr. Scott.)** A commission is now sitting to consider which lands are to come under the Act, and which are not.

966. Can we have a copy?—No doubt it will be supplied to you by the Union Government.*

967. **(Mr. Sinclair to Mr. Woollatt.)** I suppose the speculating companies of which you spoke, whose shareholders got no dividend in the early days, were simply, during those years, holding the land for a rise?—Yes.

968. That is the reason why they would get no dividends?—Yes.

969. Do you agree with me in believing that the middleman when he is a speculator in land is a curse to a country?—Yes, when he is holding land for a rise which is badly needed for farming purposes.

970. Is it not a fact that when the land ultimately reaches the man who has to work it, he is for all time loaded up with the middleman's profit, and has to earn interest on it as long as he holds the land, and everybody who comes after him who buys at his price?—Yes.

971. Where land is available in any locality, and there is in that locality land hunger by the many, are representations made to the Government to induce them to take up land compulsorily?—There have been numbers of cases under the old Natal Government before union took place. Things have been upset since.

972. When land is taken by the Government under those circumstances in order that it may be cut up for the man who wants a smaller area, does the Government road the land and fence it into smaller portions?—No, they survey it into small blocks.

973. And are those smaller areas put up for sale for cash, or are they balloted for?—They are balloted for.

974. Is it a part of the system that those who are successful once shall be excluded from future competitions?—Yes, no one who is the holder of a portion is allowed to acquire one of these blocks.

975. **(Sir Rider Haggard.)** Now, what proportion of the land of Natal is held by these absentees?—**(Mr. Marwick.)** I could not say definitely, but very considerable areas.

976. Would it be a quarter?—Possibly one-eighth or one-tenth.

977. No actual tax has ever been put on them?—No, there was one once, but it was only in force one year, and then taken off.

978. Why?—It was put on when the Natal Government were hard up, and when they got flush next year they took it off.

979. You are of opinion that it would be a very good thing if such lands were taxed so as to force them on the market?—Yes.

980. And so as to put an end to this practice of holding up great blocks of country for a rise?—Yes.

* See Act 27 of 1913.

Pietermaritzburg, 27 March 1914.] Mr. J. Marwick, Mr. S. B. Woollatt, Rev J. Scott, and Mr. D. M. Eadie. [*Migration, Land Settlement, and Irrigation.*

981. Is it not a fact that people in this country, perhaps in the great majority of cases, are holding a great deal more land individually than they can work to advantage?—**(Mr. Woollatt.)** Yes, and that is where East Coast Fever did us some good. It prevented these people trekking to the thorn veldt and made them grow food.

982. Many people are holding far more land than they can put to profitable use?—Undoubtedly. Half the land held by Europeans is not used.

983. It is practically waste land?—Yes, in summer there is abundance of grass and very little stock, and in winter it dies off.

984. And somebody puts a match to it and burns it off—what there is of it?—Very often.

985. It is a state of affairs that will bear improvement?—Oh, undoubtedly, and that brings up the question of the value of the ground and the water supply. The average farm is only half grazing land, and you cannot call any grazing land worth more than 30*s*. But when you come to hard-and-fast agricultural land, there are lots of land worth as much as 10*l*. an acre, if you could pick out the eyes of a farm. There are many farms, if you could cut them up into lots of four, three of them would have no water. Mr. Scott did not mention that.

986. I think Mr. Scott mentioned 5*l*. for the whole farm, all round, not picking out the eyes?—There are, in my opinion, very few worth 5*l*. for the whole farm.

987. There would be farms where you have a very strong spring and a deep valley with good soil, say 20 feet deep, that you could irrigate?—Yes.

988. That may be worth 5*l*., 10*l*., or 20*l*. an acre?—Yes. The wattle industry has put up the value of land a good bit. Syndicates bought the land at 5*l*. and 7*l*.—land which any man would starve on. All parts of the country are not suitable for wattles. Where I live, on the Mooi river, the frosts are too great and would kill it.

989. I do not understand yet about this Act. You say an Act has been passed, and you say a Commission is sitting on an Act which has become law?—I will explain. The Act was passed, but certain of its provisions were suspended for the time being, because it was doubtful what land would be affected. There were principles involved in this Act, and one was that it was felt by European farmers that they did not want native locations dotted about in their midst. For instance, at Mooi river, a certain man bought a farm. He was a speculator, and he saw a way of making money by cutting up the farm into two-acre lots and selling it to the natives. Of course, that meant that in the middle of the European community there would be a native location without control. Now, in the past, when natives have bought farms they have bought as a syndicate, and when the land failed to pay and reverted to the European, all the syndicate has gone down, and this system has lost its popularity. But when this man had the idea of selling individually, the natives were keen. And that was one idea of this Act, to set apart certain definite areas on which natives should live and to set apart other areas for European occupation only, and any natives living there could only live as tenants, giving their services in lieu of rent.

990. They were obliged to give forced labour?—Yes. The natives on my own farm, for instance, give forced labour. They pay no rent, but they are allowed to run their cattle and goats, and give their labour in lieu of rent.

991. You value their labour and set it off against their account?—Yes. The same would hold with any one else, except that you cannot have the curse of farms full of native tenants who pay rent to an absentee owner in Johannesburg. They steal your sheep, cut your trees, and if you kiek them off for misbehaving themselves, they go to the next farm, the owner of which holds the land to draw rents from the natives.

992. Has the Act been passed?—Yes, but the Commission is sitting to determine the lands which are to be set apart for the natives and which are to be set apart for Europeans.

993. **(Sir Alfred Bateman.)** Is it a Union Act?—Yes.

994. **(Sir Rider Haggard.)** It means an entire upsetting of the native policy then?—No. It will come about gradually. It is not retrospective. If natives are paying rent to-day, you cannot make them give service in lieu of rent. It cannot alter the contract. But if I turn a native off my farm he cannot go to another farmer and pay rent.

995. It is in operation?—Yes.

996. **(Sir Alfred Bateman.)** The Commission is sitting to define the land?—Yes.

997. They must have an equal amount of land somewhere?—Yes.

998. They do not want to dispossess the native of his land?—No.

999. **(Sir Rider Haggard.)** Does it apply all over South Africa?—Yes, I think so.

1000. **(Mr. Garnett.)** Am I right in understanding it this way: Suppose I have a farm on which I have been accustomed to let the natives live, receiving from them rent, and also their labour, which I have had to do to make the farm a payable proposition, in future I can only work with the man's labour—I must not eke out by charging rent?—You may with those who are there now, but not under any new contracts.

1001. Unless the value of the work given by the natives was sufficient to pay interest, they would have to go?—Yes.

Pietermaritzburg (Nel's Rust Farm), Saturday, 28th March 1914.

Senator The Hon. Joseph Baynes, C.M.G., farmer, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce," see p. 241.*)

1002. **(Sir Alfred Bateman.)** Is there anything that you would like to say about closer settlement?—There is a great difficulty in that regard in this country. In other countries, closer settlement is brought about by working men going out to the country and engaging themselves to some farmer there, and then gradually starting on their own account. Here, he cannot do that. The European farmer is so well satisfied with the labour that he gets from the coloured man that he is greatly disinclined to take the white labour.

1003. But he wants the superintendence to be white, does he not?—He does that himself.

1004. I should have thought he would want help?—He does the superintendence himself. If I had time to take you round I could show you natives ploughing, sheep shearing, and other farm operations conducted by the native, and by the native absolutely, and in a way it would be difficult for the European to excel.

1005. Then there is no opening for the European to come here?—As a white labourer there is very little opening indeed. As a supervisor or manager there should be room for him. And those are the men who later on take up land themselves, and start farming on their own account. Those are the men who farm successfully, because they have the industrial education and the capital necessary for the conditions which exist in this country. I hold there is no country in the world where the farmer can be more independent and enjoy life more than in Natal with the labour that we have. It is so different from New Zealand, where the

farmer's wife has to do everything for herself in the household, and where the conditions of labour are so different from those here. I would not go to any other country, with my experience, to start farming and leave this. The conditions here are infinitely more happy for the master than in New Zealand or anywhere else.

1006. **(Mr. Garnett.)** You are in favour of closer settlement. You say there is no room for the agricultural labourer to come out. What class of man have you in your mind to put on the land for closer settlement?—The man who has capital enough to start farming.

1007. He must have capital?—Yes.

1008. And what amount would you place as the minimum of land on which he must start?—I can hardly say. My experience is with large areas, and I have had little or no experience of small areas.

1009. And, therefore, you would not like to say what capital he should have for starting on these small areas?—No; I could not give very reliable data on that.

TRANSVAAL.

Pretoria, Monday, 30th March 1914.

Mr. Izaak Jacob Haarhoff, J.P., called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce" "Forests" and "Fruit," see pp.* 249, 301, *and* 319 *of this vol., and on "Mining," see p.* 33 *of* [*Cd.* 7707].)

1010. **(Chairman.)** What are the points you wish to bring before the Commission?—In regard to land settlement, first of all, I do not think the Government carry it out in the proper way in one respect at least. There is this handicap—if the Government gives you a grant, or you buy a farm and the Government approves of it, they will give you an advance of 80 per cent. and you have to provide the 20 per cent. That farm is, in a manner, sub-let to you till you have made so many payments. But the Government not only get all the money they are entitled to, the full amount with interest, but they retain the mineral rights in the land, and I think that is a very big handicap. It is not fair to a man who picks out a piece of land to his satisfaction, for the Government to say, "All "right, we are going to keep the minerals." That is also the same fault with the land companies in the Transvaal. They do the same thing. They buy the land, keep it for a few years, and I think if you inquired, in the majority of cases they are making 100 per cent. to 500 per cent. profit on the land they have bought in the last five, ten, or fifteen years. But they are not satisfied with that, they still stick to the minerals.

1011. Your point is that the mineral rights should go with the surface rights?—Yes, then otherwise I think the Government arrangements are fair. Now, Mr. Bourke has touched on the Springbok Flats District.* That is one of the best bits of country I have ever seen in my life. On that land you can pull a plough straight for 50 miles, and there are not many parts where that can be done.

1012. Where is this district?—It is to the north of Pretoria. There are places on these flats where they have found the soil to be 1,500 feet. That is information I have had from the Irrigation Department. I was up there not two weeks ago, and you can now travel through sweet grass as high as this table all together. People have no idea what that part of the country is like. It is only lately that we have found what is there. Now, if the scheme which I suggested to the Land Department were carried out there would be an immense development in the district, but the Land Department have declined to undertake the work as irrigation experts say that national irrigation schemes are impossible in South Africa. You have on the west the Crocodile River, and on the east the Olifants Rivers, and if these two rivers could in some way be connected by means of canals, you could put all that country under water, or, at any rate, you would have the benefit of a canal crossing it.

1013. **(Sir Rider Haggard.)** Are the levels all right?—That I cannot say; in fact, on the Flats it is impossible to say which way the water is flowing because the country is so level.

1014. **(Chairman.)** How far is this from Pretoria?—It starts about 35 miles.

1015. At what village?—At Pienaars River Station.

1016. And how far north does it extend?—As far as Potgieters Rust.

1017. **(Sir Rider Haggard.)** The railway line runs right through the middle?—Yes. If the irrigation scheme on these Flats could be carried out at least half of the area could be used for citrus fruit. It is doing well to-day. I have never seen anything better than the fruit you get there. The maize crop is an absolute success, although the drought has been against it up to the beginning of the year. But in spite of that it is a success. The cattle there are always in good condition, and it is practically from that part that we get the principal supply of cattle in the Transvaal. You find Angora goats do well. Persian sheep do extremely well, and within 5 or 6 miles of the railway you can find lots of wild ostriches running to day, and game, of course, any amount. Another subject that I should like to mention is that of oil nuts or monkey nuts, and those are worth an average of 8*s.* to 10*s.* per 100 lbs. In that district they grow with very little attention.

1018. In regard to these Springbok Flats, what is the value of land there, and is it held in private hands?—Yes, it is held by private people very largely.

1019. What is the value?—The value is anything between 10*s.* and 16*s.* an acre; in some places cheaper.

1020. What is the rainfall?—About 14 inches.

1021. Not in these droughty years?—It is pretty well up to 14 inches always, rather more than less.

1022. Then it is purely a question of water to have successful results?—Yes.

1023. Are there any successful farms up there?—Yes.

1024. Well, the general effect of your evidence is that there are enormous possibilities in the Transvaal, and it is merely a matter of capital and a little intelligence to turn them into cash?—Yes.

1025. Are you of opinion that the real prosperity of the Transvaal will depend more upon its soil than upon its minerals in the soil?—I would say yes.

1026. And it is to that which you look for the permanent support of the country?—Yes, the possibilities are there.

1027. I suppose the fact is that owing to the glitter of gold and diamonds the soil has not had sufficient attention given to it?—Yes, that is one reason, but another one is that the people have not had the benefit of practical example.

* *See pp.* 246–8.

1028. And is that not due to the reason I gave, namely, because they have been too enamoured of the gold and diamonds?—No, not the majority of the people. No doubt that is true of a certain section.

1029. And you think what is wanted more than anything else are a few pace setters?—Yes.

1030. Anyhow there is wealth lying in the soil waiting to be exploited?—Yes. I can give you an example to show the truth of that. After the war there was a certain farmer who had six mules, 300 morgen of land and a plough, and that man sold his citrus crop last year for 8,000*l*.

1031. Is there an inexhaustible market?—Yes, in London and Europe; we have hardly touched it yet. You can grow anything. One man, for instance, has made a fortune by growing winter tomatoes in this country.

1032. Have you put down bore-holes in these Flats? Do you find water?—Yes, in some places, but in others they have gone down 1,500 feet, through nothing but soil. In other cases they have found water at 40 feet and 50 feet.

1033. Have they found any great quantity?—You can always keep the bore-hole pump going.

1034. In your opinion, there are no difficulties that cannot be overcome?—No, there are not. That is my belief.

1035. **(Mr. Sinclair.)** Are you able to give the area of which you were speaking that could be watered by means of canals and races?—I could show it better on the map, but I should say it would be a strip of country 100 miles long by 100 miles wide, roughly speaking.

1036. And you said, in answer to the last examiner, that these lands were in private hands?—The Government owns a good bit, and also the land companies.

1037. Has anything been done by the Government or by surveys to ascertain whether a scheme of irrigation is feasible and what would be the cost?—No, not so far as I know.

1038. As a large portion of this area is in private hands, will not private enterprise touch it, seeing that they would benefit if they did?—The point is that the private people owning this property are so fully occupied with gold-mining in Johannesburg that they do not seem to be able to do anything outside.

1039. They are leaving the irrigation of the land until later, is that so?—Yes, I suppose so.

1040. And when there are no more gold mines, probably the land gold mine will be exploited?—Well, it is too long to wait for that.

1041. **(Mr. Garnett.)** You said a good deal of this land is being held up by land companies. Have you anything to add on this point?—Well, a great deal of development would take place if people could get the land on reasonable terms. But to-day, if a man buys a farm from one of these companies, they probably charge him 10*s*. an acre and very likely they only gave 1*s*. 3*d*. or 2*s*. an acre for it, and in addition to that large profit they retain the mineral rights, and they can encumber the farmers' lands and plantations at any future date if they so desire.

1042. And you think that the effect of charging that price for the land plus the reservation of the mineral rights under the soil acts very detrimentally to the development of the land as an agricultural proposition?—Yes, to a certain extent I think so.

1043. Has anything been suggested to get over that difficulty?—Well, one of the political parties in this country is very strong on the question of the taxation of unimproved lands, but what is to be the result of that I do not know. That is one of the things before us in the future.

1044. The problem of holding up land is one of the things that will press upon you in the immediate future?—Yes, because it retards development. There are a lot of young men growing up in this country who would make good farmers if they could only get that land on reasonable terms.

1045. You say there is at present a class of man desirous of coming on the land who is prevented from getting on it by this private ownership?—Well, I heard indirectly that when this Land Settlement Board was started there were 800 applications and one man got what he wanted; but, of course, I would not vouch for that.

Johannesburg, Friday, 3rd April 1914.

Mr. HOWARD WALLACE SOUTTER, Mr. ALFRED FALKLAND ROBINSON, and Mr. ERNEST CHAPPELL, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Post, Telegraphs, and Steamships,"* see *p.* 81, *on "Bills of Lading," p.* 91, *on "Railways, Harbours, and Coal for bunkering and Shipment," p.* 140, *on "Empire Development," p.* 161 *of this volume, and on "Exhibitions,"* see *p.* 124, *on "Statistics," p.* 130, *on "General Trade Questions," p.* 173, *and on "Legislation," p.* 183 *of* [*Cd.* 7707].)

In a letter dated 4th February 1914, *the Chamber had referred, amongst other matters, to the fact that the Commercial Chambers in the Union had repeatedly urged upon the Government the importance of pressing forward schemes of land settlement and immigration.*

Mr. Robinson read the following additional Memorandum on the subject:—

DEVELOPMENT OF THE NATURAL RESOURCES OF THE COUNTRY.

This subject has been referred to in our preliminary statement, but there is one very important point which, if the agricultural development is to adequately progress, must be given the serious and immediate consideration of the Government, namely: the necessity of schemes for the proper conservation of our rainfall, and the promotion of irrigation. It is to the development of agriculture and the raising of stock that not only Johannesburg, but South Africa, must rely upon in the future for its permanent prosperity; that there are enormous possibilities of both is generally admitted. We have a climate almost second to none. We have perhaps cheaper unskilled labour than most of the European countries, and we have in many parts of the country soil capable of producing almost anything. All that is needed is a larger population on the land, which, however, can only be attained if the land is first made capable, by properly organised schemes of irrigation, to carry the population.

1046. **(Mr. Sinclair.)** You lay stress, as so many witnesses have done, on the need for systematic steps being taken to promote land settlement and irrigation?—**(Mr. Robinson.)** Yes.

1047. I am not going into the question with you, because it has been so fully discussed, but I take it that irrigation is the basis of the future agricultural development of your Union?—That is what we think.

1048. And it will specially serve, will it not, to promote small settlement, inasmuch as it will lessen the risk which the small farmer and the man with little capital have to take in respect to drought?—Well, we think that irrigation will bring about such a tremendous improvement in the capacity of the country for growing foodstuffs for stock, that the farmer, in future, will be able to make a very reasonable living out of quite a small piece of ground, when he has a certainty of obtaining winter feed for his stock, while to-day he can hardly make a living out of a very much larger piece of ground.

1049. The existing conditions to-day are greatly against the man with little capital starting on a com-

paratively small area. He really cannot do so and take the risks that he himself must run, as things are to-day?—I think they are almost entirely opposed to that.

1050. **(Mr. Garnett.)** You said you believed that in irrigation lay the future of South Africa. Has the counter proposition—dry farming—been considered at all by you?—**(Mr. Robinson.)** Certainly.

1051. Have you anything to say?—I do not think the Chamber has discussed it at all, but we have naturally been interested in following the various experiments that have been made with dry farming, and I think there is a future for dry farming, but not in the form of making it suitable for the small settler.

1052. In your opinion, this irrigation will have a greater future in this country than dry farming?—Yes. I believe there is a greater scope in this country for the small man, where there is such an enormous amount of rain which, at present, simply runs away to the sea, without any attempt being made to conserve it.

(*For further evidence on this subject* see *Ehrlich, pp. 158–62 of* [*Cd. 7707*], *Vintcent, pp. 171–6, and Edmeades, pp. 189–198 of this volume.*)

APPENDIX I.

Johannesburg, Thursday, 2nd April 1914.

Evidence given by Dr. William Macdonald, author of "Dry Farming; its Principles and Practice," sometime Government Dry Land Agronomist, and editor of the "Union Agricultural Journal," before a Committee of the Commission, consisting of Sir H. Rider Haggard and Mr. Tom Garnett.

(*For evidence of this witness on "Animal and Agricultural Produce," see p. 267.*)

(Witness.) As regards irrigation I would like to emphasise the benefits of deep boring. Some time ago I prophesied that underneath the Kalahari we would find water. The other day on the western border of the desert the Government boring expert struck a magnificent stream of water. My idea is that the whole of that wonderful western country is underlaid with water, and all you have got to do is to put down a deep bore to tap it. Tree planting is also necessary to check soil erosion. It would stop these hot dry winds which are robbing the soil of moisture, and you want to bore in order to get pure water for your stock and for your household. But this is not a country for irrigation.

1. **(Sir Rider Haggard.)** How much land could you put, under irrigation?—A very small amount. The total area of the Union of South Africa is over 300,000,000 acres. The total area at present under irrigation is less than 1,000,000.

Now, gentlemen, I would like to speak briefly in regard to the question of land settlement. Land settlement has never been a great success in this country.

2. What then are the reasons of failure?—To my mind, the first real reason is the want of knowledge, and the second reason is the lack of earnestness in promoting land settlement. It is an amazing thing to me to reflect that the most successful settlement in this country—the settlement of 1820—consisted of only 1,020 men. Well, when you consider that that small number had such an enormous influence upon South Africa so far back as 94 years ago, you can better realise what such settlement would mean for this country if conducted on the lines of Canadian settlement, at, say, 400,000 immigrants per annum. An attempt was made at land settlement by Lord Milner shortly after the war. It cannot be said that the attempt was altogether successful.

3. To what was it due?—It was largely due to the fact that the land chosen for the settlers was not suitable, or, in other words, the locality was not suitable. At that time, shortly after the war, this country was ravaged by that virulent disease which has now almost passed away. To-day we have practically conquered disease because we have conquered the tick. Consequently, there is no reason whatsoever why closer settlement at the present time should not be absolutely successful because nowadays we have a better and fuller knowledge of the climatic conditions of the country. We have conquered the tick and dry farming has revolutionized this country. One thing still remains to paralyse our country. It is the large farm. Many farmers in South Africa are suffering from the fatal curse of the large farm. In the Transvaal, the average size of a farm is 5,000 acres; the average farm in the United States is 143 acres; in England 66½ acres; and in Belgium 14½ acres.

4. On one of these large farms in the Transvaal, how much land will you find under cultivation?—Perhaps 10 acres, 20 acres or 50 acres or, at the most, 200 acres. In other words, a small percentage of the total holding. There is another thing we suffer from—locked-up land. On the one hand we have the Government holding 46 million acres of magnificent land and growing practically nothing upon it. The Crown lands of the whole Union amount roughly to 46 million acres. There are 20 millions in the Transvaal, and there are 10 millions in the Zoutpansberg, the richest and best developed land in the British Empire.

5. How much of that land is free from malaria?—It is impossible to say, but probably about one-half. Not long ago we had Surgeon-General Gorgas in this country. He appeared to think that South Africa was a country from which malaria could easily be eradicated as has been done in Panama.

6. **(Mr. Garnett.)** I think it is one thing to abolish malaria in a narrow strip like the Panama Isthmus and quite another thing to abolish it in an enormous area as you have got here?—I wish to make a strong point of this problem. I do not think that the question of malaria is any excuse for the locking up of some of the finest land in the British Empire. I have noticed that some of the witnesses before the Commission have stated that capital is necessary for South African farming. My opinion is that character comes before capital, and that you will never develop this country if you are going to depend upon men with capital. Men of capital, large capital, are holding huge areas in this country, and what have they done in the way of development? The men who should be brought to this country are the Scotch crofters and the English peasants, poor men, honest men, hard-working men, men who, if you give them a small piece of free land will be satisfied to work hard and improve their farms, and make their homes in this country.

7. **(Sir Rider Haggard.)** How are such men to settle and subsist on a patch of poor veldt?—If our people were really in earnest, there are many ways by which we could settle such men in this country. For example, since I have left the Government service many farmers have said to me, "We will take your Scotch "crofters and we will give them a small house, pay them "a small wage and we will give them some sheep or "cattle, and the run of our land." There are men to-day who have begun with nothing. Take the farmers of Natal; many of them are wealthy men to-day, some of them worth hundreds and thousands of pounds sterling, and those men in many cases started with next to nothing.

8. After some experience of those immigration problems, I cannot understand how you could bring agricultural men from Norfolk, without a sixpence, and expect them to make a living on a piece of poor veldt.

9. **(Mr. Garnett.)** I think I may say that we have not in our minds the development of the land by great capitalists, but, rather, we would like to know how is the man with a few hundred pounds to come here and get his experience of the country before he risks his money. The great capitalists who hold blocks of land are entirely outside of the scheme altogether. It seems to us that the man with small capital would starve before he could get any food?—If the Government of this country were really in earnest about this matter of land settlement and immigration, the first thing they could do would be to choose the immigrants carefully, give them assisted passages and allow them to remain for, say, two years free of cost on the Government Experimental farms in order to get local experience. There are now a great many Government farms. There are stud farms, sheep farms, fruit farms, and stock farms. What is being done with these farms? Little, in comparison to what might be done. The tax-payer is paying heavily for the up-keep of these farms. This country is spending three-quarters of a million pounds sterling on agriculture—a higher percentage per head of population than any other place in the world—and South Africa is not going ahead because there are too few people in it. Another point is the pressing need for advertising. Last year when I was in England I found it impossible to get reliable agricultural information about South Africa. There is little or nothing to be had in the High Commissioner's Office, or in the Trade Commissioner's Office. You pass across the street to the offices for Canada or Australia and you can get any amount of information. Now there can be no doubt that we should advertise our country. The finest work in this direction in South Africa has been done by Mr. Tatlow, the Manager of the Publicity Department of the South African Railways. That is due to the broad, far-sighted outlook of the General Manager of the South African Railways, Mr. W. W. Hoy But what is the use of this internal advertisement of South Africa when we have no land to offer for settlers from oversea. To develop your land you must build new railways. But what is the greatest thing in modern agriculture? It is not dry farming; it is not irrigation—it is railway-building.

10. But how can you obtain money for fresh railway schemes unless you bring in people to cultivate your waste lands?—Many people in this country tell you that we should develop our country by means of the poor whites, but the poor whites are a mere handful of people. What we really need and what we must continue to work for is to bring into this country, say, 100,000 good, hard-working, capable colonists. Is it not a shame that this splendid country last year should have lost a thousand more men than the number of the immigrants who came in? Can a country such as ours, with its wonderful resources, be said to be advancing under these conditions? The future of the country depends upon one thing and one thing only, and that is population. If we were to bring in a vigorous population we would soon change all that by tree planting, by fencing, and by grazing. For example, take our veldt. The moment that you stock it you tend to improve it, and then you can grow new and better fodder for winter feed. Sir Percy Fitzpatrick, one of the best of our dry farmers, has more than 2,000 acres of excellent pasture grasses. Again, there is no doubt that the heavy rainfall on that grass does not do such injury to the soil as it would falling on the hard-baked veldt. The practical solution of all our present agricultural hardship is an increase in the right kind of population.

11. **(Sir Rider Haggard.)** Are you aware that there is no great class such as you desire to draw upon in the British Isles; are you aware that that class has already been exploited, and all who remain of men and women go to Canada and Australia: that the agricultural labouring class has, you may say, petered out? Do you know that?—I know well that the great mass of my countrymen are going in their tens of thousands to Canada and Australia; but I am equally certain that if I had the land to offer I could get a thousand sturdy Scotsmen to come out here; and it is worth while to remember that only a thousand settlers in 1820 transformed the whole of the Eastern Provinces from a wilderness to a veritable garden.

12. **(Mr. Garnett.)** I also wish to point out that as regards the Continent of Europe—northern Europe has ceased to be an emigrating country, the class now drawn upon are Lithuanians, Scandinavians, Italians, Poles, &c., all that class. That is the class that the United States and Canada are drawing upon; what result it may make we cannot yet tell, but the fact remains that northern Europe is practically a closed book so far as emigration is concerned. The result of all inquiries tends to show, that the class which you evidently desire is extremely limited, that the time has almost gone by; or in other words, you in this country have lost your market.

13. **(Sir Rider Haggard.)** I take that what you want, Mr. Macdonald, is, afforestation and population, but that your most pressing need is population. I ask how much population the Union can carry?—A hundred million people. So far as irrigation is concerned there are enormous possibilities in the building of small dams, but I also hold the opinion that there should also be a large national irrigation scheme, so far at least as the Free State is concerned.

14. **(Mr. Garnett.)** I rather gather that you personally would back, so to speak, dry farming against irrigation?—In reply to that I would state that the possibilities of dry farming are greater than the possibilities of irrigation over the whole area of the country. But, of course, land under irrigation will yield twice as much and more per acre than land under dry farming. South Africa must mainly be a country where dry farming is carried on. It can never be a great irrigation country, because, in the first place, we have not the natural topography, and secondly, we have not many great rivers. But every farmer should endeavour to conserve the storm-waters by means of small dams. Consequently, every farmer should be both a dry farmer and an irrigation farmer.

15. Has the Government any great water conservation works?—The Government is doing a great deal to press forward irrigation in the different Provinces, but they have not yet taken up a big single irrigation scheme such as, in my opinion, should be adopted in the Free State in connection with the Basutoland

mountains. The Government deserve much credit for what has been done so far as irrigation is concerned, but I do think that there should be more of what I might term preaching the gospel of irrigation to the ordinary farmer. I consider the experts in the Department of Irrigation should spend more time in the veldt than in their offices.

16. It has been represented to us, in reply to a question as to the irrigable land on the Orange River, that it is useless to irrigate unless you have railway communication. That refers, of course, to the distant lands, because although irrigated it would be difficult to dispose of the produce? If you are going to have successful close settlement under dry-farming or irrigation, the alpha and omega is railway communication. There is no use of irrigating land unless you have the railway first, and then you can be certain of marketing the produce of the settlers.

17. Have the attractions of the mines for capital and the richness of the return been, or will they during their life be, an obstacle to capital being invested upon the land? Are not the keenest brains and intellects at the present moment directed towards the mining industry?—No doubt the mines have attracted a very able class of men, but it is a remarkable thing that in South Africa a larger proportion of men are directly or indirectly interested in farming than perhaps in any other part of the world. The mining men are all interested more or less in farming. Several of them have put their sons on the land and they are working for the development of the land. But there is no doubt that much more could have been done both by the Government and by the mines. Something should be done to make it possible for the miners on the Rand to get small holdings for themselves and their families. We shall never have industrial peace until we make our people happy and contented, and I do think that, in this connection, both the Government and the mine-owners might have done something ere now.

18. Would you agree with this as a general proposition? However rich the mines may be, however long their life may be, every day that passes makes them more and more a dwindling asset, and that it is extremely important that the primary productions of the soil should be increased to such an extent that when the last ton of ore is mined you will be in a position to have an export trade from the primary productions of the soil which will take the place of the mines when they no longer exist?—I quite agree with that. We should endeavour to do what California has done. The present agricultural productions of California, if I mistake not, are now five times as valuable as the largest output of gold from the mines in the zenith of their production. We should press forward with land settlement, but we can do nothing with the land until we get more people, and the great need of South Africa at the present moment is population.

APPENDIX II.

Johannesburg, Friday, 3rd April 1914.

Statement of Mr. William Palmer, Lands Department, Messrs. Lewis & Marks, to a Committee of the Commission consisting of Sir Rider Haggard and Mr. T. Garnett.

Mr. Palmer stated that Messrs. Lewis & Marks control a considerable area of land, mainly in the Transvaal, under the name of the African and European Investment Company, Ltd. The total area held amounts to 1,320,000 acres, divided into 209 farms.

The Lands Department of the Company was organised in November 1913; since that time there has been considerable demand for farms from South Africans, but no steps have so far been taken to introduce suitable setlers from Great Britain. The Directors intend to do so, when the time appears ripe for such action. About half the area held is settled.

The Company offers land under a five years' lease with option of purchase at any time during that period. The option may be exercised by buying the farm outright or by paying 25 per cent. of the purchase price, payment of the balance being spread over a further period of five years at 6 per cent. interest per annum. The terms of the lease provide for effective occupation of the land, and require, amongst other improvements, the planting and cultivation of at least five fruit trees, and 50 forest trees during each year of the lease. The Company is prepared to give financial assistance for the erection of farm buildings and for well-boring, &c. At the end of the lease, if the tenant has not purchased the farm, the option to buy under the original agreement lapses; any improvements effected by the tenant are taken over at valuation. The Company also leases farms suitable for stock and agriculture to tenants who do not desire the option of purchase. There are still a few tenants on the old system of leasehold, under which no cash rent is paid, but the lessee gives one-third of the produce to the owners.

Mr. Palmer stated that the average selling price of the land was from 15*s.* to 30*s.* per acre—in some cases more, the value being dependent on locality. The land being offered at 10*s.* an acre in Rhodesia was on the whole not so fertile.

Very few tenants are anxious to buy outright; they have not sufficient money. Tenants with experience are preferable, in Mr. Palmer's opinion, to tenants with capital, although some capital, at any rate in the form of cattle, was necessary. Owing to risk of loss from disease, the Company does not issue stock to settlers. For settlers from overseas, a capital of at least 1,000*l.* is desirable before starting farming in South Africa. Mr. Palmer advocated the reduction of steamship and railway fares in order to induce farmers to settle in South Africa.

The farmers are going in largely for mixed husbandry, cattle-raising and growing maize and kaffir corn. In the north tobacco is grown; cotton-growing has so far been scarcely attempted.

Mr. Palmer considered that there was a very promising outlook for breeding mules and horses, and advocated Government assistance in developing an export trade, especially in army mules and remounts for India. Sheep-breeding is not carried on to any large extent in the Transvaal, but a large number of sheep have been introduced into the Free State from New Zealand and Australia with considerable success.

The flow of water in the bore-holes on the farms of the Company has been decreasing, and Mr. Palmer considers that the great problem before South Africa is the proper conservation of the water supply. Irrigation was more profitable than dry farming, in so far as it permitted ostrich breeding; otherwise the profits from the best form of dry farming were as good as from irrigated land.

Mr. Palmer put in the following statements as to the cost of growing wheat, maize, and oats in South Africa, and the profits realised:—

COST OF PRODUCTION OF WHEAT, MAIZE, AND OATS IN SOUTH AFRICA.

10 years average—native labour 50*s.* per month.

Conditions.—High and middle veld, dry lands. Soil—average quality.

Wheat:—
Average crop—4 bags (200 lbs.) per acre or 20 bags to 1 sown.

	s.	*d.*	
Ploughing	5	0	per acre.
Harrowing and planting	2	0	,,
Seed	5	0	,,
Fertilizer	20	0	,,
Twine and cutting, 1*s.* 6*d.* Stacking 1*s.* Threshing 4*s.*	6	6	,,
Bags	2	4	,,
	40	10	,,

= 10*s.* 2½*d.* per bag.

Oats:—
Average crop—4 bags (200 lbs.) per acre or 12 bags to 1 sown.

	s.	*d.*	
Ploughing	5	0	per acre.
Harrowing and planting	2	0	,,
Seed	5	0	,,
Harvesting and threshing	6	6	,,
Bags	2	4	,,
	20	10	,,

= 5*s.* 2½*d.* per bag.

Maize:—
Average crop—6 bags (200 lbs.) per acre or 150 bags to 1 sown.

	s.	*d.*	
Ploughing	5	0	per acre.
Harrowing and Planting	2	0	,,
Seed	1	0	,,
Cultivation of crop	3	0	,,
Fertilizer	6	0	,,
Harvesting	3	0	,,
Threshing	3	0	,,
Bags	3	6	,,
	26	6	,,

= 4*s.* 5*d.* per bag.

COMPARISON OF COST OF PRODUCTION ON FARM AND PUBLISHED PRICES.

July 1913.

	Cost per Bag.		Market Price.		Gross Profit. Per Bag.		Gross Profit. Per Acre.	
	s.	*d.*	*s.*	*d.*	*s.*	*d.*	*s.*	*d.*
Wheat	10	2½	22	0	11	7½	48	6
Oats	5	2½	14	8	9	5½	37	10
Maize	4	5	11	0	6	7	42	6

In the case of wheat and oats, the crops should be credited with the winter grazing, while the threshed straw has some feeding value. In the case of maize, the stalks may be worth up to 10*s.* per acre, when fed off.

APPENDIX III.

STATEMENT BY MR. CHARLES ALBERT MADGE, LAND MANAGER OF TRANSVAAL CONSOLIDATED LAND AND EXPLORATION COMPANY, LIMITED.

I am only in a position to deal specifically, as far as figures are concerned, with the affairs of the company of which I am the land manager. It is, however, the company owning the largest area of land in the Transvaal, and is in many general ways typical of other land companies.

The company was formed in 1893—at a time when South Africa, and perhaps particularly the Transvaal was popularly supposed to be studded with a prodigious number of hidden mines of exceeding richness; and for many years there was very little attempt, and small inducement, to develop its landed assets as farming propositions. During the last ten years a serious effort has been made in this latter direction, and beneficial results, to the country and to the company, are beginning to be realised.

The area of the land owned on the 31st of December last amount to 3,167,613 acres, in addition to which the company held mineral rights over a further 274,275 acres.

By far the greater portion of this land is situated in the more outlying parts of the country, where means of communication are peculiarly lacking, where there is very little European occupation, and where agricultural development—in the few places where any exists—is still in its initial pioneering stages. The company has assisted considerably in bringing these areas to the state—primitive as it may still be—of development and occupation which has so far been reached. Experimental agricultural and pastoral farming operations have been initiated and carried on at a number of centres, and these operations have of recent years aided materially in bringing about the beneficial European occupation of a steadily increasing area of land.

The area of the company's land held under lease, or otherwise beneficially occupied, by Europeans at the present time amounts to some 416,000 acres; in addition to which there are a considerable number of trading stands, &c., most of the tenants carrying on stock-farming operations on the adjoining land. Apart from this a large aggregate area of land, the greater portion being remote from the railway and in those parts in which European occupation is in its infancy, is occupied by native tenants.

Ten years ago the area of the company's land occupied by Europeans was negligible; but since then occupation has steadily and consistently advanced. During the first few years of the pioneering work many of the company's tenants barely overcame great difficulties in establishing themselves. The position has now to a great extent changed; and since January 1st, 1912, the company has sold approximately 224,000 acres, a considerable proportion of which was purchased by tenants, and representing 51 distinct sales. This land has been purchased for *bonâ fide* farming purposes, and brings the total area of the company's land brought under beneficial occupation during recent years to approximately 640,000 acres. The total sum realised by the sale of the 224,000 acres amounted to 128,288*l.* 7*s.* 1*d.* The terms of payment are as a rule one-fifth of the purchase price in cash at the time of purchase, and the balance, bearing interest at the rate of 5 per cent. per annum, in five to eight equal annual instalments. The mineral rights are in the case of all sales reserved by the company, provision being made for the full protection of the rights of the purchasers in the event of prospecting or mining operations taking place.

The most usual period for which land is given out on lease is for seven years, with an option to purchase either at a fixed price during the lease or at a price to be agreed upon at its termination. The rentals are very low to commence with, and increase by a moderate amount during each succeeding year; the matter of rental being, therefore, of small consideration to the tenant until he has established himself. As an example, many farms of from 3,000 to 5,000 acres in the less settled districts have been leased for periods of seven years at an average rental of 30*l.* per annum, the rentals payable by the tenants being 10*l.*, 15*l.*, 20*l.*, 25*l.*, 35*l.*, 45*l.*, and 60*l.* per annum, respectively, for each succeeding year of the lease. Compensation is paid for improvements at the termination of leases under reasonable and defined conditions. The gross rental received by the company from European tenants during 1913 amounted to 2,662*l.* 10*s.* 5*d.*

I think that the figures given above are sufficient to rebut, so far as this company is concerned, the evidence given at Cape Town by Mr. G. R. Hughes, the Secretary for Lands for the Union. Mr. Hughes stated that the terms and conditions offered by land companies which had come to his notice were, he thought, most illiberal,* and could not compare with the terms offered by the Government in the Land Settlement Act of 1912. He further stated† that, during 1913, 45,745 morgen, of a valuation of 153,124*l.*, came under the operations of the Act as a result of 100 approved applications During this same period the company disposed of 67,794 morgen for the sum of 76,513*l.* The land dealt with by the Government was doubtless better situated and more valuable than the land disposed of by the company, but the figures I have given would hardly bear out the statement concerning land companies made by Mr. Hughes. I merely deal with this matter as it is of considerable importance to land companies that an erroneous idea of the policy adopted by them should not go forth to the world on the authority of a responsible Government official without direct contradiction.

As I have indicated above, the greater portion of the land owned by the company, and this applies equally to the land owned by other companies, is situated in the more remote and sparsely inhabited districts of the Transvaal, where means of communication are primitive and development of every description is in its infancy. From personal observation, extending over a number of years, I am convinced that these districts are capable of great development, and in many parts can be prepared to support a large European population. Cattle ranching on a large scale, for which many parts of the northern Transvaal are eminently suitable, will probably be the next important development. The prospects are equally as good as in those parts of Rhodesia where much capital is now being invested in this direction—and land can be obtained as, if not more, accessible and suitable, and upon as favourable terms.

The growing of maize has shown steady progress both in the quality of the corn produced and the area devoted to its production; and probably in future greater profit—both to the farm and the farmer—will be derived by the sale of meat and dairy produce consequent upon the feeding on the spot, rather than the sales of the maize grown on the farm. Cattle raising and maize production are the two main branches of farming for which great areas of the northern Transvaal have so far been proved to be eminently suitable.

The farming industry of South Africa needs a far greater degree of organisation than it possesses at present, and it also needs an influx of experienced farmers attracted by its possibilities to invest their capital and energy in its soil. To attract the class of newcomers needed, an organised and profitable industry must be offered, and land which can be obtained upon reasonable terms—and at the present time the general knowledge concerning detailed particulars is peculiarly vague. Very active departments of land and agriculture are essential to the material development of the land of the Union.

* *See* Q. 282, p. 16. † Q. 265, p. 14.

A very remarkable general advance has of recent years taken place in the agricultural and pastoral development of South Africa. The country is beginning to give practical proof of the great potentialities of her land—and it only requires a little statesmanship to solidify the results so far achieved, and to build up upon them a flourishing industry capable of attracting men with capital and experience at present in other countries. I realise that what I have stated above consists to a great extent of generalities—for South Africa is a country where generalities flourish and which is only beginning to get down to the bedrock of facts. But behind generalities remarkable developments are in progress, of which the figures I have given in respect of the area of the company's land sold to and occupied by *bonâ-fide* farmers—much of it in districts up to recent years totally neglected for agricultural development—are a not unreliable indication.

A few words concerning the activities of the company in the direction or prospecting and mining operations, with their results, may be of interest. After considerable investigation and prospecting of the company's property, a payable tin proposition was located in 1907 on the farm Groenfontein No. 871 in the Waterberg District. The net results of the operations at the mine since the discovery up to the end of 1913 show a total profit of 145,134*l.* for a total capital expenditure of 64,314*l.*, equivalent to approximately 225 per cent. on the outlay. Thus a total net profit of 80,820*l.*, after repaying capital, has been produced; and the property possesses a valuable plant and fair prospects of further considerable profits. The company also possesses, as a result of its prospecting operations, mineral prospects in the course of development, in respect of which the expenditure stands at 69,877*l.* In addition to the above, a sum of 101,338*l.* had been expended and written off up to the close of 1913 in respect of unsuccessful endeavours to locate payable mining propositions.

The greater portion of the company's land has been thrown open, in terms of the Precious and Base Metals Act of 1908, for public prospecting; and the discoverer of payable precious metals is entitled to the same reward as if the discovery had been made on Crown lands. Special rewards and favourable terms are offered to discoverers of payable base metal propositions on land open for prospecting.

In conclusion, I would add, as a matter particularly pertinent to the investigations of the Commission, that one, and by no means the least important, of the many pressing needs of the Union of South Africa is that of cheap transit by sea and land for approved immigrants, their families and goods.

JOHANNESBURG,
31st March 1914. C. A. MADGE.

Mr. Madge, in the course of an oral hearing at Johannesburg on April 3, 1914 before Sir Rider Haggard and Mr. T. Garnett, supplemented the memorandum printed above with additional particulars on the following subjects:—

(1) *Land Settlement Act.*—Under this Act a man desirous of purchasing land applies to the Government stating the sum for which he can obtain it. The Government has the land valued, and if they approve they buy it and sell it to the applicant. He pays one-fifth of the price in cash, and the balance in instalments over twenty years. A man purchasing land from the Transvaal Consolidated Land and Exploration Company, Ltd. also pays one-fifth of the price in cash, but the balance is repayable within a period of from five to eight years. The same rate of interest is charged by the Government as by the company, but the period within which the balance is payable differs, the Government being in a position to offer better terms than a private company.

Mr. Madge also challenged Mr. Hughes's statement* that lessees of land companies in many cases were

* *See* Q. 282 on p. 16.

dissatisfied with the terms on which they held land and desired to come under the provisions of the Land Settlement Act. Mr. Madge stated that this was the reverse of his experience and that of several other managers of land companies with whom he had discussed the subject. He also asserted that owing to delay and difficulty in obtaining land from the Government, intending settlers came to the land companies.

(2) *Anti-malaria Campaign.*—Efforts to combat malaria, especially in the northern Transvaal, are being made by the South African Anti-malarial Association, of which Mr. Madge is chairman. The association distributes cards containing directions for avoiding malaria, to schools, public offices, and farm houses. The instructions are printed in English, Dutch, Sesuto, and Zulu. The subject is also taught in all the schools in the malarial districts of South Africa.

Malaria is fairly common in certain parts of the Transvaal, but if ordinary precautions are taken there is no danger. In the low-lying districts the whole native population is malarial, and the disease is transmitted to the healthy European. People are now, however, building their houses a certain distance to windward of the tracts.

Investigations are being made with fish which eat mosquito larvæ, but no definite result has yet been reached.

(3) *Cattle Ranching.*—Mr. Madge emphasised the suitability of the Transvaal, especially in the north, for cattle ranching when dipping is properly carried out. In the Rustenburg district three men were started on a small scale with cattle on three different farms. In 1908 9 sixty-one heifers and five cows were placed on these farms; in 1910, a further six heifers and three cows, and in 1913, an additional 44 heifers and 20 cows, making a total of 111 young heifers and 37 cows. At the end of January 1914, the natural increase totalled 351 and after deducting losses showed a net increase of 300 head of stock. Similarly, 100 cows were sent in 1908 to a farm in the Middelburg district, and a further 58 in September 1910. The natural increase to the end of February 1914 numbered 510; the deaths during the six years were 44 calves and 58 cows, but a very large number died in the early days after being shifted from one part of the country to another. Another farm was ravaged some years ago by East Coast fever; this was got under control in 1911. Ninety-two cows and 41 young heifers were sent to this farm in 1912. Up to February 28, 1914, from this stock 162 calves had been born, the total deaths numbering two. In 1912 an additional 100 head of oxen and young stock were placed on this farm; the loss has consisted of one calf. The cattle on this farm are dipped every fortnight.

APPENDIX IV.

Extract from Statement handed in by the Transvaal Agricultural Union.

(*For the evidence given by the representatives of the Transvaal Agricultural Union and for extracts from their statement, on "Animal and Agricultural Produce," "Cotton" and "Fruit," see pp.* 254, 286 *and* 320.)

Attention has been called, by a large number of correspondents, to the increased charges which are now being made for the use of Government boring machines, and it will be readily seen that such an increase, amounting, as it does, to 100 per cent., is likely to deter farmers from making use of one of the most necessary facilities which they formerly possessed, and that the development of agriculture will be thereby greatly retarded.

In the opinion of many correspondents, everything possible should be done to assist farmers in connection with the construction of irrigation works on sound lines, especially where a co-operative scheme would be of undoubted value to a combination of farmers.

Boring Machines.

It is necessary to remark here that the Irrigation Department of the Transvaal has done, and is still doing, excellent work. A large number of boring machines are at work, 17 of which are of South African make, and many of these have been constructed by Mr. Maenamara, of Zuurfontein. For some time past no fewer than eight boring machines have been in constant use in the Rustenburg district. An instance of the value of this work is afforded on the Springbok Flats, where, only a short time ago, only about 10 farmers were struggling to exist. Following on boring by the department, this number has been greatly increased, and the great majority of the settlers are making comfortable livings. In Bechuanaland much useful work has been done, and boring operations are being carried on with success in what was formerly regarded as a portion of the Kalahari Desert and which was known as the Republic of Stellaland, under the Boer régime. In the portion of the Bloemhof district known as Schweizer Reneke, good work has been done, and many farmers who were formerly compelled to trek to the Hartz river with their stock are now in a position to remain on their farms. From personal knowledge it is evident that this area is one full of promise, and during a recent visit of the Secretary of the Union, where a meeting of farmers was held, the chief desire expressed was that the prices charged for boring should be reverted to, in order to enable farmers to avail themselves of the opportunities for securing water which has been proved to exist in such abundance, and which would enable them to remain, in still greater numbers, throughout the year, on their farms, with their stock.

APPENDIX V.

Letter from Mr. F. E. Kanthack (Director of Irrigation).

(*For Mr. Kanthack's evidence, see pp.* 1–6.)

Union of South Africa,
Irrigation Department, Pretoria.
(At Cape Town.)
27th March 1914.

Sir,

With reference to your letter of the 9th instant, asking for an estimate of the total amount of water flowing to the sea in the Union of South Africa annually and of the proportion which could be conserved by means of works, I very much regret that the preparation of such a statement at the present time is impossible.

Precise hydrographic gaugings are comparatively new in South Africa, and whilst very complete gaugings exist for some few rivers in the Transvaal, ranging over a period of seven or eight years, in other parts of South Africa information regarding rivers is either entirely wanting, or is now only being acquired at the present time.

Stream ganging in South Africa is a most difficult and costly operation, as it cannot be done with the ease with which permanent streams in America and elsewhere are gauged, but requires very costly works and apparatus with which to record the amount of water passing over gauging weirs in remote portions of the Union during brief and spasmodic floods.

The Government has for some time past been spending approximately 8,000*l.* to 10,000*l.* per annum on stream gauging, but it will be many years before sufficient information is acquired to do justice to the question which has been sent to me by your Commission.

I have, &c.

F. E. Kanthack,
Director of Irrigation.

Secretary,
Dominions Royal Commission.

APPENDIX VI.

Letter from Mr. F. E. Kanthack (Director of Irrigation).

(*See Mr. Kanthack's evidence, Question* 110, *p.* 5).

Union of South Africa,
Irrigation Department, Pretoria,
(At Cape Town).

Sir, 9th May 1911.

I have the honour to forward herewith certain statements, &c., which I promised your Commission in the course of my evidence.

I regret so much delay has taken place, which is mainly due to the difficulty in obtaining certain information regarding bore-holes sunk in the Orange Free State, the records of which were first thought to have been lost in the Bloemfontein Government Buildings, burnt down some time ago.

Statement I.—Notes on the Census Figures for 1911, regarding the Amount of Land Irrigated in the Union.

In Part IX., Table XI., pages 1,254 and following, the extent of land irrigated in the Union is given as follows:—

	Morgen.
Cape - - -	282,367
Natal - - -	18,671
Transvaal - - -	113,756
Orange Free State -	49,308
	464,102 morgen.

In compiling the above statistics, it is obvious that the returns submitted are either most incorrect in most cases, or that the term "irrigated land" is given most elastic meanings in different districts. It is possible that the figures given for the various Cape districts may not be very far out. I certainly cannot take exception to the result for any particular district. From a good general local knowledge of that Province, they appear to me to be certainly relatively correct. In the Transvaal and Orange Free State, however, the figures are obviously wrong and greatly overstated. The following returns are striking examples of this statement:—

Lydenburg - -	13,662 morgen.
Pretoria - -	14,139 ,,
Rustenburg - -	12,926 ,,

and in lesser degree most of the other districts returned exaggerated totals, and it requires no very great local knowledge of the Transvaal to pick out figures such as these as obviously impossible. Moreover, the district figures throughout the Union for irrigated land are in most cases entirely inconsistent with figures given in other tables of the same volume in the Census Report.

From a superficial analysis, for instance, of Table XVII., it will be seen that in many cases there is a very great discrepancy between the total area under cultivation and the total area under irrigation; thus Lydenburg reports only 11,148 morgen under cultivation, of which nearly 6,000 morgen are stated to be under maize, whereas the figures already quoted show that Lydenburg is supposed to have 13,662 morgen actually irrigated.

The three districts mentioned above are by no means heavily irrigated, and the figures given in the Census Report can, I consider, be discounted as too inaccurate to serve any useful purpose.

The crop returns in Table XVII. support this contention, as the yield from the only crops which could possibly have been irrigated is wholly insufficient to support the figures given in Table XI., page 1260.

As regards the Cape, a rough check on the figures can be obtained by studying the census figures for ostriches. There are reported to be 725,000 in the Cape Province (Table V.) and the great majority of these birds are being maintained on lucerne pasture. Assuming, then, that one morgen of the established lucerne will maintain six birds throughout the year, which is an accepted average figure, there should be something like 121,000 morgen of lucerne in the Cape Province as against 61,174 morgen actually reported. It appears to be that the Cape lucerne area has been under-estimated. My conclusions are briefly that whilst the Cape totals appear to me to be somewhat under-estimated, those for the Transvaal and Free State Provinces are greatly overestimated.

With regard to an estimate of the amount of land in the Union capable of irrigation, I consider it would at the present stage be most rash to attempt to do this. It is going to be some little time yet before it will be safe and politic for me to give an estimate of this kind.

Statement II.—Estimate of the Quantity of Water which has been Developed by Boring in the Union.

Two statements are submitted: Statement (*a*) refers to bore-holes which were drilled by the various Colonial Administrations or subsidised by them prior to Union. Statement (*b*) relates to Government work done throughout the Union since the 1st June 1910.

As regards Statement (*a*), this must be taken only as an approximation. No records whatever are available for the Province of Natal; the Free State figures are incomplete, and in the Cape a certain amount of drilling has been done since the system of granting subsidies was stopped, in respect of which no records whatever exist.

In Statement (*a*), the yield of water from bore-holes in the Cape Province has been taken from Annexure C of the Annual Reports of the Public Works Department of the Cape of Good Hope for 1909–10 and 1910 (partial).

In Annexure "A" (page 114) of that report, it is stated that since 1884, when boring was apparently first started in the Cape, up to the 31st December, 1908, a sum of about 449,690*l.* had been expended on water-boring by means of Government drills, the sale of drills to farmers on the £ for £ principle, subsidy paid to farmers for boring and well-sinking carried out on their farms by contractors or their own drills, and experimental deep boring.

The total yield of water given in Annexure "C," viz.: 54,162,719 gallons, refers to the period 1893–1909 only, no data of results prior to the former year being available.

Subsidised Boring.

The report of the Chief Engineer for Public Works for the year 1907 (page 36) contains a tabulated statement showing that during the period 1904–1907, 3,929 bore-holes, yielding 106,130,446 gallons per day, were drilled for farmers by contractors working under a State-aided system.

Figures are not available for the period 1st January to 30th June 1908, on which latter date subsidised boring as well as work with Government drills, with the exception of one machine in Bechuanaland, was suspended in Cape Colony.

In respect of boring carried out in the Transvaal prior to Union the figures given in Statement "A" include the results and cost of several boreholes drilled by Contractors working under Government subsidy while this system was being tried, but these being a negligible quantity, have not been shown under a separate heading.

Statement "B."

The figures relating to boring since Union have been extracted from the records of this Office and are complete and correct. The results include a few boreholes drilled by contractors, chiefly in the Free State, but these constitute a very small percentage of our work. No boring has been carried out in Natal.

STATEMENT III.—AN ESTIMATE OF THE AMOUNT OF LAND LIKELY TO BE BROUGHT UNDER IRRIGATION IN THE NEXT FIVE YEARS.

It is estimated that the area under development, apart from land actually irrigated, such as is referred to in the Census Report, is approximately 100,000 morgen, and I estimate that the rate at which new works are being undertaken in the Union is adding 50,000 morgen annually to the land already being developed referred to above.

I have, &c.,
F. E. KANTHACK,
Director of Irrigation.

The Secretary,
Dominions Royal Commission,
London.

P.S.—I forward herewith, for the information of your Commission, copy of this Department's Report* for the period 1st January 1912 to 31st March 1913.

F. E. K.,
Director of Irrigation.

"A."

STATEMENT OF WATER OBTAINED BY BORING IN SOUTH AFRICA PRIOR TO 31ST MAY 1910.

II. COMMUNICATIONS.

(a) Post, Telegraph, and Steamship (including Freights).

CAPE OF GOOD HOPE.

Cape Town, Wednesday, 25th February 1914.

Mr. JEREMIAH WILSON, Postmaster-General of the Union of South Africa, called and examined.

1053. **(Chairman.)** You are Postmaster-General of the Union of South Africa?—Yes.

1054. You have been good enough to prepare some interesting tables* for us. Perhaps you would be able to make a general summary of the main features of interest?—Shall we take the mail section first? I think you wished some information particularly in connection with the mail service to Australia *via* the Cape.

1055. Both as regards South Africa and the possibilities of a joint service between the Cape and Australia.—Taking the South African Mail Contract first; you probably know that it runs from October 1912 to the end of September 1922; that is, for a period of ten years. We pay for the service between Southampton and Cape Town 150,000*l.* a year. We pay, in addition, 21,000*l.* a year in order that the mail steamers may proceed to Durban. The latter payment was made before Union. The Natal Government had paid a similiar sum to attract the mail steamers to that port, and the payment was continued under the new agreement. Prior to Union, we had paid 135,000*l.* a year as a mail subsidy. At that time the Cape Government was entirely responsible for the contract, but the South African Colonies shared the subsidy with

* Not printed.

the Imperial Government on the basis of the use which they made of the service. In the existing contract, certain provisions had been included which did not appear in the previous contract. For example, provision had been made for the exportation of fruit at cheap rates ; for cold storage accommodation, and also for the importation of pedigree stock free of freight. These, I think, are the principal features in which the existing mail contract differs from the previous one. We are of opinion that the existing contract, so far as South Africa is concerned, is a fairly reasonable one, and we feel we have little reason to complain. That is our opinion of the terms generally of the contract. With regard to the speed—a matter which, I believe, you are particularly interested in—the late contract was for 16 days 15 hours—originally 16 days 20 hours, and then reduced after three years. The existing contract is also for 16 days 15 hours, but there are provisions which will enable the Government to negotiate for a quicker speed if that should be found desirable. In negotiating the contract we did not lay very great stress on the question of speed. Our anxiety was rather to secure a regular service, and to obtain other advantages which we did not previously possess. We were successful in getting these other provisions inserted in the contract. I do not know whether I can say any more than that in connection with the contract.

1056. (**Sir Alfred Bateman.**) Were you connected with the Cape Government Post Office before the Union ?—Yes.

1057. I think I remember you giving evidence some seven years ago. You gave us some evidence about deferred rebates and the service generally ?—I think Sir Somerset French gave the evidence.

1058. Were you not with him ?—No.

1059. In your contract you have tried to provide for all those things ?—Yes.

1060. I suppose it would not be in order for us to ask you about the difficulty that has arisen in interpreting the contract, because the matter is *sub judice* ?—I should prefer not to make any statement, seeing that the matter is one for the Arbitration Court in London. I think I may say the Government referred the matter to the Arbitration Board because they felt there was good reason for the complaints that were made. It was an undoubted fact that certain shipments of non-signatories to a particular agreement issued by the shipping companies had been shut out, and the question was, of course, whether such action on the part of the mail contractor was not an infringment or contravention of the Post Office Act. That is for the arbitrators to decide.

1061. But in one respect a recommendation of the former Commission has been carried out—that there should be an association of shippers who would deal with the shipping companies. It is someone outside the association who is now raising the difficulty ?—Yes, as I understand it, there is, in London, a South African Merchants' Committee, but it is held by some on this side that the Committee is not fully representative of South African interests.

1062. There are interests outside ? — Yes, that appears to be the position.

1063. But since this contract has been entered into, there has been some improvement in the freight service to all the ports, has there not ?—I think there has been a slight increase in rates.

1064. There were differential rates before ?—Yes. There are differential rates to-day as between ports—I am speaking from memory—but I believe the rates to Cape Town and Port Elizabeth are similar. To East London I think they are somewhat higher, and slightly higher again on goods delivered to Durban.

1065. In your contract, you did not try to secure this division of traffic, did you—30 per cent. to Durban and so on ?—No, we did not endeavour to do that in connection with the mail contract.

1066. And the difficulty now is simply because preferential treatment has been given to these people—practically—the London Conference of Merchants ?—Yes, to these people who have signed an undertaking by which they would ship all their goods by what are known as the "Conference Lines."

1067. Meanwhile, all the differential rates were done away with ?—Yes, as between shippers.

1068. And was primage done away with at the same time ?—Yes, primage was done away with, except to the extent of 5 per cent. on imports by mail steamers.

1069. I suppose these rates do not come before you, do they ?—No.

1070. You think this contract secures better terms than if you had a contract for short periods with independent lines ?—I think so.

1071. Because there are several competing lines, are there not ?—There are a good many lines—particularly those trading with Australia *viâ* the Cape ; but when we called for tenders in London, we got none from them, as they were apparently not in a position to tender.

1072. If this became the mail route to Australia, I suppose it would put you in a much better position ?—From a purely postal point of view it would be quite convenient. The Post Office is concerned only with the mail service, and so long as we have a regular service and at a reasonable speed, we, as a Department, are satisfied.

1073. I suppose it is absolutely regular ?—Absolutely. I think only on one occasion last year was a mail steamer late, and that particular steamer arrived in England within the period of grace allowed.

1074. Is the mealie contract part of the mail contract ?—It is subsidiary to it—running practically concurrently.

1075. It is the same term ?—Yes.

1076. Are there any other preferential rates ?—The Government have a freight contract for the conveyance of their own materials and stores to this country, which is considered fairly reasonable, as well as special rates for South African produce.

1077. Is there anything that prevents differential rates in favour of large shippers ?—There is a clause in the mail contract which states that small shippers must have their goods carried at the same rate as the large shippers.

1078. And in any question of breach of that, does it come before the Board of Trade ?—No. There is a clause which provides for arbitration before a board to sit in London, one of the arbitrators to be appointed by the Government of South Africa, another by the Shipping Company, and, if necessary, they appoint an umpire between them.

1079. That is the arbitration which is now proceeding ?—Yes.

1080. There is one other point regarding the differential rates. Supposing there was a very low rate from New York *viâ* Liverpool ?—That would not affect us.

1081. That is not provided for in your contract ?—It would not affect our contract in any way.

1082. (**Mr. Sinclair.**) Is the Post Office on the Union-Castle Steamers regarded as the Post Office of the South African Union ?—It is jointly run by the Imperial Post Office and ourselves ; we share the cost in equal proportions. The officers in charge are Imperial Officers.

1083. And letters that are put in outside the three-mile limit may be stamped with the stamps of either country ?—Yes.

1084. Is there to your knowledge any tendency on the part of the officers on these steamers to create the impression that only South African stamps should be used ?—I am not aware of it.

1085. I ask the question, because when letters were posted outside the three-mile limit at Madeira, there was a disposition to suggest that only South African stamps could be used ?—I was not aware of it.

1086. The query was made as to what stamps should be used, and the reply was given that stamps of the South African Union were the proper ones to use. Now the English stamp carries greater weight, does it not ?—That is so.

1087. You are not aware of an attempt to create such an impression ?—No.

1088. Well, I suggest that it exists?—I did not know of it.*

1089. (**Sir Rider Haggard.**) One can only send from South Africa half an ounce for one penny?—Yes.

1090. The Postal Union allows an ounce?—Yes.

1091. What is the object of the half-ounce limit: does it make any difference really in the cost of conveyance?—Yes.

1092. Is it much?—It makes a very great difference in the revenue. There is a provision in the Postal Union Convention whereby countries who have not been able to adopt the ounce unit may still maintain the half-ounce unit, and South Africa is one of those countries. The decreased revenue is not merely as regards over-sea postage; but in respect of inland postage as well. Our unit in South Africa is half an ounce. So it comes to this: if we were to alter the unit of weight for over-sea correspondence, we should have to alter the unit for the whole of South Africa correspondingly. That means a very serious financial loss to the Union, which, up to now, we have not been able to face. We have been constantly reducing rates in one direction or another, but we are not yet in a position to bear the loss referred to. The matter will come up again no doubt at the next Postal Union Congress at Madrid in September, and the question arises whether that Congress will further extend the time during which countries may still maintain the half-ounce unit. In a country like this, where the postal revenue is not nearly so large as in countries with a denser population, and where distances are so great over which mails have to be carried, we are not in the same position to increase weights and still maintain the same rates as older countries.

1093. If I suggested that the object was to make people use extremely thin and inferior note paper, and to make writing thereby very illegible, I should be wrong?—That is another way of looking at it.

1094. Then as regards the possible route for mails *viâ* the Cape to Australia, you as a Post Office are scarcely concerned in the matter?—We are very little concerned.

1095. Do you see any prospect of any great increase in the speed of the mails between this country and England?—I think that the increase of speed will have to come rather through the passenger requirements than the mails.

1096. I think that nearly forty years ago, when I came out to South Africa, the time taken was a month to reach Natal, and now you come here in sixteen days. Do you anticipate any corresponding acceleration in the future?—It would be very difficult to say. No doubt we shall get some.

1097. Would it be desirable and advantageous to have an acceleration?—I think certain of the travelling public would wish to have quicker communication.

1098. (**Mr. Garnett.**) Your contract provides against differential rates as against goods?—Yes.

1099. We have had instances in various places of goods being shipped at a through rate, say, from Hamburg right away through, at considerably less than goods of the same class carried from London in the same ship. Have you had any complaints?—I have not.

1100. Would your contract cover a point like that?—No.

1101. That would be a matter for the persons themselves?—Yes.

1102. (**Mr. Tatlow.**) Did I understand you to say that the present contract includes provision for increase of speed?—Yes.

1103. Does it include the terms?—There is one provision which states that if the period of time is reduced to 16 days we shall pay the Company the sum of 19,000*l.* That is the limit.

1104. Does the contract provide for further reduction?—There is a general provision which makes it possible for the Government to enter into negotiations for further reductions. It is a matter of mutual agreement.

1105. Do you think that the present time gives general satisfaction?—Yes, I think so on the whole. There are certain people who desire to travel quicker, but I believe most people are fairly well satisfied.

1106. If you did alter the postage rate to one ounce instead of half an ounce, have you any figures to show what the loss would be on the present basis? Is it a fact that the great proportion of letters are under half an ounce?—Well, that is a matter which has been looked into from time to time, and I remember there was a conference in Cape Town of the different Postmasters-General a few years ago, and at that time it was considered that the loss would be something like 35,000*l.* The mail service has grown since then, and while I am not prepared to speak definitely, I feel certain that the loss would be well over 40,000*l.* a year.

1107. I think you said that the present contract included provision for the carriage of mealies?—There is a subsidiary contract.

1108. Was that of very substantial benefit? Was the rate previously much higher than 10*s.*?—The former rate was 11*s.* 6*d.* per ton of 2,240 lbs. as against the present rate of 10*s.* per ton of 2,000 lbs., but the shipping companies had been seeking to raise the rate to 14*s.* per ton of the higher weight. The arrangement also gave the South African producer stability of rates, which is a thing he was rather keen to have.

1109. Is that 10*s.* secured for the whole term of the contract?—Yes.

1110. There is no chance of an increase at all?—I think not.

1111. There are no contingencies?—I am not positive.

1112. (**Chairman.**) I understand that you pay 171,000*l.* a year altogether as a subsidy?—Yes.

1113. Does that frank any amount of mail matter?—Yes.

1114. Both ways?—Yes, both ways.

1115. Against that I suppose you have certain receipts from the English Post Office?—Yes. The South African mail contract is arranged in this way—the contract is made by the Union, but the Mother Country contributes to the cost of the service on the basis of the use made of the mail steamers. By that means the Mother Country contributes a net amount of something over 60,000*l.* a year.

1116. At what rates is that calculated?—At the Postal Union rates for this purpose. South Africa provides the rest of the money, that is to say, the Union of South Africa and Rhodesia with a small payment by the Bechuanaland Protectorate. All receipts which come from foreign countries and also those which come from the carriage of parcels to and from the United Kingdom are paid into what is called the pool account. The money thus received is deducted from the total payment which would require to be made by the Imperial Post Office and also by the Union of South Africa and Rhodesia. That is how the thing is arranged.

1117. So that when the net amount is arrived at, what does the Union of South Africa pay out of the 171,000*l.*?—I think it is 38,000*l.*, plus 21,000*l.*, making a total of roughly 60,000*l.*

1118. And for that it gets any amount of mail matter franked which it chooses to send?—Yes.

1119. Compare that system with sending mails at poundage rates; how would it come out?—I am not certain whether you are referring to the Postal Union rates.

1120. I understand there are two rates,—the Postal Union rates and what is term in England the statutory rate?—Yes. The statutory rate would be very much cheaper. We call it the private ship rate.

1121. Under the statutory law you can send mail matter by any ship sailing, I presume?—Yes, English or foreign.

1122. At a certain rate per pound?—Yes.

1123. Could you give me any figure to show what is the rate, or what it would work out at?—Yes, I could.

1124. It would be interesting to have that?—That is from South Africa?

* The witness subsequently informed the Commission in a letter dated April 8th, 1914, that the question of the sale of British stamps on board mail steamers was under consideration.

1125. Showing how that system would work compared to the present system from a pecuniary point of view?—Yes.*

1126. In this mail contract of 1912 you obtained some valuable concessions, I believe. Can you tell me in what way this contract differs from what you desired to obtain? Were there any points that you had to abandon?—No, I do not remember any point. There was a good deal of negotiation around the amount of the subsidy, but I think we got pretty well all we wanted otherwise.

1127. But you had to pay rather more for it?—Yes.

1128. With regard to higher speed, is there anything definite in the clause inserted, as it seems to me to be rather vague?—There is nothing absolutely laid down. There is only a provision made that the contract can be altered in that direction.

1129. Subject to a new agreement accepted by both parties?—Yes.

1130. It really only means that the matter can be again discussed between you?—Yes, that is so.

1131. On the question of speed, it has been said that although you get greater regularity now, the period taken on the voyage now is very little, if anything, better than the time taken fifteen years ago, and that passages used to be made in the same time, or even less, by ships. Is that so?—We have one famous case, in which the "Scot," belonging to the Union Company, came out under 15 days.

1132. Did not a rival ship come out in the same time?—I think one other vessel came out under the contract time. It was said that the "Scot" burnt an enormous amount of coal.

1133. But you would not base any argument upon that, even taking into account the progress of the art which has taken place?—I think that as science progresses the speed will become greater up to a certain point. But, as I said before, I think the passenger requirements will rather dictate the speed than the mail service.

1134. Then, as responsible for the mail service, you are prepared to let the passengers fight it out with the Company themselves?—I can hardly say that, but that is certainly rather the consideration.

1135. Under clause 53, the company undertakes to place orders for two new mail steamers, and during the currency of the agreement to provide at least six new mail ships?—Yes.

1136. Have you got any particulars as to the two ships now ordered?—I am unable to give any. Two new ships have been recently placed on the East Coast route.

1137. It provides that immediately after the ratification of this agreement the Company will place orders for two new mail ships?—I understand orders have been placed.

1138. Referring to a previous question, is it the case that the post office on board the mail steamers should accept English stamps?—Yes. I understand they are supplied with them.

1139. You might look into it?—I will make a note of it.

(**Mr. Sinclair.**) I used English stamps, and on being told it was wrong, I placed South African stamps over them.

1140. (**Chairman.**) I want to refer to clause one of the Mail Contract. Can you tell us what the bearing of that clause is?—Clause six of the Post Office Act is the one referred to in the contract. I will read it. It states that the Governor-General may enter into contracts in writing with any person for the conveyance by sea of postal articles to and from the Union beyond the limits of South Africa. The Governor-General shall not enter into any such Ocean Mail Contract with any person who is connected either directly or indirectly with any such shipping or other combination as the Governor-General may deem to be detrimental to or likely to affect adversely South African trade or industries or gives, offers, or promises to any person any rebate, refund, discount or reward upon condition that such person shall ship goods by vessels of such lines to the exclusion of any others. It says further that the Governor-General may make regulations as regards dock, wharfage, tranship, or other like dues at any port or harbour of the Union on goods transhipped from vessels owned or chartered by such persons. (*Quoting from Act.*)* The reason for these provisions was, of course, to strengthen the Government in dealing with the rebate system. You will see that power is given to the Government to differentiate against persons who do not observe these provisions. That is to say, as regards the treatment of their vessels at the ports, which would make it practically impossible for them to live.

1141. (**Sir Alfred Bateman.**) I understand that the Government has the privilege of rates for Government shipments?—Yes.

1142. Was there any opposition to that on the part of merchants?—I do not remember that there was active opposition, but the Government had lower rates than the merchants for some considerable time before.

1143. As I understand, the merchants consider it encourages the Government to get stores from home?—I think the great bulk is railway material, and, naturally, that could not be supplied here.

1144. Surely there is a good deal that could be supplied here? But you say there has been no opposition?—I have not observed any active opposition to the Government freight agreement.

1145. (**Sir Rider Haggard.**) Turning to that matter of the Post Office on the steamers again, is there any possibility of the stewards benefiting by giving inaccurate information?—None whatever that I am aware of.

1146. I myself had a fairly heavy letter, and instead of putting 1½*d.* on it, I had to put 5*d.*?—I presume you stamped the letter yourself?

1147. Yes.—Well, in that case, I do not see how anyone could benefit.

1148. (**Mr. Sinclair.**) The Postal Union rate per ton is about 300*l.*, is it not?—322*l.* for letters and post cards.

1149. Do you consider that reasonable?—As compared with the freight rate it is very high—that is for letters. The carriage of other mail matter is one-eighth of that, or 40*l.*

1150. I would just like an expression of your views?—The postal service requires the steamers to leave on a given day. They must sail by a particular route. They must sail whether full or empty. I presume all these points were taken into consideration by the Postal Union in laying down their rates of transit.

1151. In the result you do not consider the rate is unreasonable?—They have been reduced periodically. Not many years ago the rate was 15 francs per kilogramme and now it is 8 francs, and there are certain countries which have not to provide any ocean mail service, and which are constantly asking for reductions.

1152. In regard to passenger rates by the mail steamers, having regard to the rates charged by other lines, do you think they are reasonable?—I think them fairly reasonable, compared with other lines.

1153. Do they compare well with the passenger rates charged by other lines of steamers between the Cape and London?—I think for first class passengers they are practically the same, but I have no precise information on that point in my mind.

1154. (**Chairman.**) I gathered from you that by the statutory rate, you have also a fixed day. That surely is not so. Under the statutory rate the mail is sent off by any steamer that happens to be leaving?—It is only steamers under contract and to which a subsidy is paid that have to leave on a certain date and at a certain hour. Where the statutory rate, or private ship rate, is paid the ship leaves when she pleases. She must give us 24 hours' notice of her departure, however.

1155. Does the private ship rate work out at 300*l.* a ton for letters?—No, at very much less, 112*l.* We pay in the Union 1*s.* per pound for letters, 2*d.* per pound for printed matter, and 3*d.* per pound for parcels.

* The statement was supplied subsequently by the witness (*see* Appendix I., p. 84).

* *See* note to Mr Jagger's evidence, p. 62 (second column).

1156. In regard to cables now : Would you please make a statement ?—I submitted a memorandum* in connection with the cable system, in which I pointed out that the first cable was laid down to South Africa in 1879.

1157. I will not trouble you to go into the historical portion of the subject, but more with regard to the rates ?—The ordinary rate to the public has been brought down from 8*s.* 9*d.* to 2*s.* 6*d.* The Government rate of 6*s.* 3*d.* has been reduced to 1*s.* 3*d.* In 1912, the Cable Company introduced a system of deferred cables, and those are transmissible at half rates. They can be sent to Europe at 1*s.* 3*d.* a word. Then, later in the year, they introduced the week-end letter telegram. That has a minimum of 15*s.* for a telegram of 30 words and 2*s.* 6*d.* for each five or part of five additional words. The Press rate has been reduced from 9*d.* to 3½*d.* a word. There is an agreement existing between the South African Governments and the Eastern and South African Cable Company at present, under which a subsidy has to be paid unless the revenue reaches 300,000*l.* per annum. Since 1906 that revenue has not been reached, and the latest figures I have go to show that the present earnings in respect to the South African traffic are 273,000*l.* a year. So that really since the war there has been a decreasing traffic and decreasing rates. In 1900 the rate was 4*s.* and the value of the traffic 457,000*l.* Then the rate came down to 2*s.* 6*d.* in 1903 and the value was 391,000*l.* That rate has not been reduced and to-day the Company's receipts are 273,000*l.*

1158. It involves a subsidy of how much ?—To-day a subsidy of 13,500*l.* per annum, terminating in 1919. So that, having regard to the fact that the traffic has been continuously going down and that the standard revenue agreed upon at the time the agreement was entered into has not been reached, it does not seem that the time is opportune for asking for further reductions in rates.

1159. (**Mr. Sinclair.**) Do you consider that this reduction is temporary ?—I think that when the receipts exceed 300,000*l.*, we should certainly look for a reduction.

1160. Have you ever considered the matter from a rather broader point of view ? Has it occurred to you that if there was a large reduction in cable rates there would be a corresponding increase in the use made of the service by the public ?—I think that would be so, but then the cable expenses would also increase.

1161. You mean while that result was being realised ?—Yes. It stands to reason that if you are going to transmit two messages instead of one there would be greater expense in the way of staff, for one thing.

1162. Could you tell us how much of the available carrying capacity of these cables remains unused at present ?—I am not in a position to give that information, but I understand that the load on the South African cables is fairly level throughout the 24 hours.

1163. Suppose the cables were worked to their fullest capacity, how many more words could be sent in the 24 hours ?—I am unable to state that.

1164. Could you give us any idea ?—I have no idea.

1165. You do not know if they are being worked to the full capacity ?—I could not say.

1166. (**Sir Alfred Bateman.**) Are these facilities for deferred and week-end messages well advertised ?—Yes, I think so, We advertise it in the Post Office Guide and through the Press. The deferred cablegrams are referred to on the back of the forms. We have a card which we hang in the Post Offices.

1167. If anybody enquired, the Post Office officials would tell them at once ?—Yes ; I think it is fairly well known. It seems to be growing.

1168. Can you give us any figures ?—I can give you some figures as regards the deferred traffic which has gone over the Post Office wires.

1169. Perhaps you would send them in ?—Yes.

1170. (**Chairman.**) I think it would be well if you gave the progress of the deferred and week-end telegrams month by month ?—I will endeavour to do so. I do not know whether I can give the figures month by month. However, I can give the traffic in 1912 and 1913. Week-end telegrams were only brought into operation in November 1912. As regards deferred cablegrams, there will be two years' figures available.*

1171. In regard to the night cable-letters, you have not discussed that as a further facility ?—No, not the night cable.

1172. Now, in regard to receipts for deferred and week-end telegrams, are you in a position to say how much is traffic newly created and how much is diverted from the old full rate ?—No.

1173. You have not formed any personal view ?—I think that both systems have created new traffic.

1174. This Commission recommended certain facilitations in regard to week-end messages to and from Australasia, that they should be sent by telegraph throughout, and that the public should not be asked to pay for service indications ; also, that the minimum number of words should be reduced so as to make the charge for week-end telegrams considerably less than it was. Have you any views ?—In connection with week-end cablegrams, I think the minimum rate might be reduced. A reduction from 30 to 20 words and a charge of 12*s.* 6*d.* instead of 15*s.* has been suggested ; also, that the charge for additional words should be at a rate per word instead of per five words. I am also in favour of the week-end telegrams being telegraphed all the way, instead of posted and wired as at present.

1175. You consider these facilitations would increase the traffic ?—Yes.

1176. How many cables are there ?—There are three —the deep-sea one, the one along the west coast from station to station, and one *viâ* the east coast. The last is duplicated in the Mozambique Channel, but really there is only one cable along the east coast.

1177. Do messages come by all three ?—Yes. I think the Natal traffic circulates principally by the east coast, and the Cape traffic by the west.

1178. But you are not in a position to say what the load factor is on any of these cables ?—No, I am not.

1179. Would it be possible to obtain it ?—I take it that the Company in London would be the only people who could give the information.

1180. All three are owned or controlled by the Eastern ?—Yes.

1181. Returning to the week-end cables again, I understand the facilities do not exist between Africa and Australia ?—No.

1182. Has there been any idea of extending them ? —That matter has not been discussed.

1183. Now, you give the receipts for 1913 as 273,000*l.* compared to a much larger sum in previous years ?—Yes.

1184. I suppose that figure is very largely controlled by the state of the mining market ?—I think it would be.

1185. If you read the figures in your table in connection with what one knows of the activity of the mining market, there looks to me as if there has been considerable progress in reality as regards ordinary traffic, because there must have been an enormous diminution of your finance telegram receipts ?—It would be of interest to compare that, but I am afraid we have no actual basis for comparison.

1186. Would your view be in consonance with the view I expressed, or are you disappointed with these receipts ?—In consonance with your remarks ; I think that the decrease in receipts is due very largely to the want of activity in the mining market.

1187. And considering the great diminution of activity, the level of other receipts has kept up well ? —Yes.

1188. (**Mr. Tatlow.**) In answer to a question, you said that if there were any reduction in the rate, a considerable increase in the number of telegrams would probably follow, and there would then be an

* Not printed.

* The witness subsequently supplied the figures printed in Appendix II., p. 81.

increase in the expenses of the cable company?—Yes, working expenses.

1189. Does it neeessarily follow? Could there not be a considerable increase in the number of messages without much additional expense? Could not the present staff probably deal with the increase?—That entirely depends upon whether the staff is fully employed. If the staff's time is not at present fully absorbed, then it could deal with increased traffic up to a certain limit, at practically no further expense.

1190. It does not necessarily follow that there would be a large additional expenditure which your previous answer indicated?—You are quite right.

1191. **(Mr. Lorimer.)** There is rather a curious clause in your contract which makes the Union-Castle Company agents for your coal. Was there anything peculiar governing that point when the contract was made?—No, except that it was a basis or starting point.

1192. The July figure was a starting point?—Yes.

1193. Is not the effect of that that the Company gets 1*s.* 6*d.* a ton for selling the coal?—As a matter of fact, the Company guarantees to take a certain quantity of coal per annum.

1194. But this is in addition to what they require for their own use. This is the point: "In order to "assist the development of South Africa, the con- "tractors undertake to purchase for export in addition "to any quantities they require for consumption, "not less than——"?—Yes.

1195. Of course, the object may be quite worth the effort, but is not 1*s.* 6*d.* a pretty stiff commission to pay to anybody for selling coal?—It was considered at the time to be reasonable.

1196. The coal is, of course, not of the highest quality, but it is good, and there are large shipments. I may be wrong as to figures, but I want to ascertain what was the ground or reason for paying what seems to me a very large commission on a transaction like that?—The Government considered that the clause was perfectly reasonable. Naturally, they were anxious to extend as far as possible the exportation of coal.

1197. What do they do with it?—They bunker steamers here.

1198. This is in addition to what they require for their own use?—Yes, they sell it in Cape Town to steamers calling here.

Cape Town, Monday, 2nd March 1914.

Mr. Henry T. L. Leefe, Assistant Manager at Cape Town of the Union-Castle Mail Steamship Co., called and examined.

(*For the evidence of this witness on "Bunker Coal," see p.* 94.)

The witness made the following statement:—

"I understand from the Press that some questions were asked the other day in reference to an item in the Cape Mail Contract dealing with coal matters. It did not seem to me from the newspaper reports that it was quite clear to the Commission what that referred to. In the Mail Contract there is a clause which stipulates that under certain circumstances, the Company has to purchase for export fifty thousand tons of coal. But I want to point out that we are only under an obligation to redeem that undertaking when the price for South African coal is 1*s.* 6*d.* a ton less than it was in 1912—July. Now as coal has been steadily rising in price since then, we are a long way from being called upon to redeem that undertaking. That is really the meaning of the clause."

1199. **(Chairman.)** What was the price in 1912?—Roughly 13*s.* 6*d.* to 13*s.* 9*d.*

1200. And what is it now?—15*s.* 6*d.* to 15*s.* 9*d.*

Cape Town, Tuesday, 3rd March 1914.

Mr. Alwyn Ignatius Vintcent, J.P., M.L.A., representing the Mossel Bay Chamber of Commerce, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce," see page* 174)

The witness made the following statement:—

"There is just one matter which my Chamber asked me to ascertain if you would care to take evidence on, and that is the question of freight to Mossel Bay from Europe and the discrimination made by the Conference steamers between Mossel Bay and other South African ports."

1201. **(Chairman.)** Yes. I think we could take evidence on that?—I can give you a verbal statement. This in their view. Mossel Bay is served by the Conference lines, and there is a grievance that Mossel Bay is unduly handicapped in relation with Port Elizabeth, which is situated 200 miles further along the coast. For instance, steamers which call at Mossel Bay and proceed to Port Elizabeth, deliver general goods at Mossel Bay on which that port pays, on second class goods, say, 5*s.* a ton more than Port Elizabeth. On a line like cement, for instance, Mossel Bay pays 3*s.* 9*d.* a ton more than Port Elizabeth, although the goods are shipped in the same bottom. Representations have been made to the Conference lines from time to time, but no relief is obtained. We actually pay 1*s.* 6*d.* more than East London on cement, which is a port beyond Port Elizabeth. We have large irrigation works going on in the Oudtshoorn District served by Mossel Bay, and this surcharge of cement means about 8*d.* a cask, which is a very severe handicap, and which extra amount the farmer living in the neighbourhood of Mossel Bay has to pay compared with the farmer living near Port Elizabeth.

1202. What is the reply of the Company?—That, owing to the smaller volume of cargo at Mossel Bay, and the cost of deviation, it does not pay to deliver cargo to Mossel Bay on the same terms. I would point out that the deviation is not more than 25 miles, and the argument of the Chamber of Commerce as a set-off to this alleged extra cost is that they have the earnings on coastwise cargoes and passengers, which amount in the case of every call by the steamer to a sum very considerably in excess of the cost of the deviation.

1203. They say they have to make a special stop?—Well, it is worth their while to do so, because they come in with two or three hundred tons of cargo, and get most excellent despatch. It is a free port and there are no dock dues.

Cape Town, 3 March 1914.] Mr. ALWYN IGNATIUS VINTCENT, J.P., M.L.A. [*Communications : Post, Telegraph and Steamship (including Freights.*

1204. Have you figures of the annual trade in the port?—The total volume of trade there is about 66,000 tons a year, not very big. But that is not carried exclusively by the Conference lines. It includes cargo from America and Australia, and coastwise cargo as well.

1205. That compares with the trade to Port Elizabeth as to what?—I should say the tonnage at Port Elizabeth must be twelve times as large. I am simply speaking from memory. But, still, the opinion of the Chamber is that the circumstances do not justify such a heavy surcharge as exists in regard to a port in that position.

1206. **(Mr. Campbell.)** You say there are no dock dues at Mossel Bay. Are there no improvements in the port—no docks?—No, there are two jetties and the quay wall and a little breakwater, but not for the purpose of protecting ships at the anchorage. It is intended more to protect the lighters when being discharged at the jetty, and to protect the floating craft.

1207. Is there any objection on the part of the insurance companies to the boats using Mossel Bay?—No, it is exactly the same as Port Elizabeth.

1208. **(Sir Alfred Bateman.)** Is it a safe roadstead?—Yes.

1209. It is open?—Yes, the same as Port Elizabeth.

1210. You have the Mossel Bay Boating Company?—Yes, but that will be changed before long and the Government will take it over.

1211. You charge 5*s.* 6*d.* a ton?—Yes, that includes delivery into stores.

1212. Is it an increasing trade?—Yes. It is only during the last year that the port has been connected with Oudtshoorn by rail, which is the richest district in the Colony, and no doubt there will be connections between Mossel Bay and the western system, which will place the port in a good position to compete with Cape Town before long.

1213. And you think now is the time to ask for reductions?—Yes.

1214. **(Mr. Tatlow.)** Is it your opinion that the rates should be the same as Port Elizabeth, or would you consider any difference could be justified?—We all know that the bigger the volume of trade that is done the better terms it commands, and we would be satisfied if this excess were for the present reduced by 50 per cent.

1215. You think 3*s.* 9*d.* is too much?—Yes.

1216. You would not be against some reasonable difference?—No.

1217. **(Mr. Sinclair.)** What is the freight on cement from Port Elizabeth to Mossel Bay?—I should say 12*s.* 6*d.*, I fancy.

1218. Would you give it per cask?—Yes, the rate is probably 2*s.* 6*d.* per cask, if not lower. The rate from Southampton to Mossel Bay on cement is 18*s.* 9*d.*, the rate to Port Elizabeth 15*s.*, although carried in the same bottom. Well, in view of the small profit you are able to make on cement, such a figure as 8*d.* a cask is a serious handicap. 18*s.* 9*d.* a ton means 3*s.* 4*d.* a cask. The first cost of the cement is about 5*s.* 8*d.*

1219. **(Sir Jan Langerman.)** Could not Transvaal cement compete favourably with English cement?—They recently sent a representative to that neighbourhood on the subject of Transvaal cement. That is carried at a very low rate on the railway. It is carried from Pretoria to Mossel Bay—nearly 1,000 miles—at 17*s.* 6*d.* a ton, whereas the freight from Southampton to Mossel Bay by sea is 18*s.* 9*d.* a ton.

1220. So the question of cement does not enter into your grievance because you get it from the Transvaal?—It may not be so good.

1221. **(Sir Alfred Bateman.)** It is the Government Board of Railways and Harbours, which is doing these works on the jetty 600 feet long, I suppose?—Yes.

1222. Do you know what they are spending?—I think the jetty will cost 26,000*l.*

1223. That will improve your facilities?—Yes, I think the port ought to be able to handle 1,000 tons a day.

Mr. JOHN WILLIAM JAGGER, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Land Settlement : on "Railways, &c.," on "Empire Development," and on "Fruit," see pp.* 6, 102, 160, 317 : *and on "Exhibitions," "Statistics," "General Trade Questions," and "Legislation," see pp.* 124, 127, 145, *and* 181 *of* [Cd. 7707].

1224. **(Chairman.)** You are President of the Cape Town Chamber of Commerce?—Yes.

1225. And you have made a special study of the subjects which this Commission has examined and reported on in Australia. Perhaps the most convenient way will be to deal first of all with the subject of cablegrams and telegrams?—Yes.

1226. What is your view of the present condition of the service to South Africa?—I think we have a very good service as regards the cable service generally, and as regards the ordinary rate of 2*s.* 6*d.* for a code cable, I do not think we have very much to complain of. It all depends, in my view, on what you want to attain to. If you want to attain to closer relations between the mother country and the Dominions, then to my mind there can be no question that it would be very advantageous to lower the rates for the deferred cables and week-end cables.

1227. And what would you suggest?—First, I should mention that the week-end and deferred cables only came into operation during the last twelve months, and I think they are being made use of quite considerably. They are not sufficiently known yet, but I strongly hold that a reduction in cost would mean a bigger traffic, and it will certainly go a long way to keep us more in touch with the other side. When you have to write letters and wait six weeks for a reply you very often do not write them at all. But if you had a really cheap cable service many people would use it for domestic and friendly communications. We merchants generally use the ordinary rate of 2*s.* 6*d.*, because we code our wires.

1228. You think the reductions should be rather in the direction of the deferred and week-end service?—Yes.

1229. This Commission recommended that the minimum length of a week-end message should be reduced, as regards Australia, from 24 words to 12. I believe your minimum is 30 words?—Yes, and the minimum charge is 15*s.* with 2*s.* 6*d.* for each additional five words or part thereof.

1230. Would you suggest reducing that minimum number from 30 to 10, and your minimum charge from 15*s.* to 5*s.*?—I think so.

1231. If that were done, would it be a considerable convenience to private persons and to the poorer classes of the community?—I think it would be used much more freely by the private individual. Of course, it would be an advantage if cables on the other side could be transmitted by telegraph. You see, the cable is handed in on Saturday in London at present and we

do not get it till Tuesday, although it is lying next door, so to speak.

1232. It has been suggested that these week-end cables should be delivered on Monday instead of Tuesday?—Yes, but I laid stress on the rate above all, and I would not let the fact of it being delivered later interfere with the charge.

1233. By the reduction of the rate you mean the reduction of the minimum number of words and also the reduction of the rate per word below 6*d*., or do you think 6*d*. adequate?—6*d*. is a moderate rate. I remember when the rate was 8*s*. 9*d*. in this country. But the more it is reduced the more use will be made of it.

1234. Now there is a controversial question as to the proportion between the ordinary code message and the deferred. In your judgment, as a man of business with a large experience of codes, what is the compression of a message by the use of code?—I could not say. I do not make up my own code messages. I write them out and hand them to a clerk. I could not decode a message myself from our code. It is a most elaborate business.

1235. In business do you use the deferred service much?—Not much. It is almost entirely the ordinary rate. If we used the deferred it would have to be a message in plain language.

1236. Perhaps I had better continue the examination on two or three similar subjects. About the mail service, now. What have you to say about that?—The speed?

1237. Yes.—I have been very well known for urging for a good many years that we should have a very much speedier passage than we get to-day. The present speed, as you know, under the mail contract recently signed by the Government is for a passage of 16 days 15 hours. Well, it has been that ever since October 1900, when we entered into a contract for ten years with the Union-Castle Company. I have a list here showing some of the speeds that were made prior to 1898. Here was the "Scot" which made the passage homewards in 13 days 23 hours. I remember in 1892 when the "Scot" arrived here on the Sunday afternoon; that would be about 14 days 20 hours. Then there is the "Dunottar Castle" homeward bound, which made a voyage of 14 days 23 hours; the old "Tantallon Castle" 15 days 2 hours; the "Norman" 15 days 6 hours; the "Dunvegan Castle" 15 days 6 hours. Well, all these vessels have made the passage quicker than the present boats. I should like to explain also that before the Union Steamship Company and the Castle Steamship Company amalgamated, there was much more competition as regards speed than there is to-day, especially on the homeward voyage. Since the amalgamation they have pretty well kept to the regular times. Now, that is, of course, a great argument with the postal authorities. It is an argument that carries great weight also with the commercial community—the extreme regularity and punctuality of the mail service. That, as I say, goes a long way with the business people, and is, perhaps, one reason why the business people have not pressed for greater speed. But I think the time has now come when we ought to have a quicker service. Of course, the mail contract entered into the other day is also for the same time, 16 days 15 hours, but the Government has reserved the right to reduce the passage to 16 days on a further payment of 19,000*l*. And I also notice in one of the clauses of the agreement they also take the right there to call for an accelerated service. When we have been pressing for this increase of speed, the mail company have said, "If you are prepared to pay we will put on the boats," but our people have never been prepared to pay more for the service.

1238. I think when you were negotiating with the Mail Steamship Company the Government here had the idea of sending mails by available ships under what is termed the "statutory rate" in England. Have you considered that?—Yes. Of course, that was the time when we were engaged in negotiating the new mail contract, and the Government had made up their minds to lay down as a condition of the contract that no mail contractor should be allowed to give rebates. When Donald Currie & Co. were the Managers for the Castle Company they simply refused to give up the rebates; in fact, they entered into agreements with other steamship companies like the Bucknall, Clan, and Ellerman Harrison lines not to give up rebates for another seven years. Of course, the Government had to look round and make inquiries as to the possibility of the mails being carried by other steamers, and I calculated at the time that there would be a ship calling here outward-bound 30 times a month.

1239. And homeward-bound?—Not so frequently—perhaps not more than half as many. But I do not think the commercial people were keen on the proposal, though, in my opinion, under that system we should have more opportunities of mailing to Europe than we have to-day.

1240. Less regular, less rapid, but more frequent?—Yes. Of course, there is no doubt that one thing that has largely reconciled the people in this country to the present service is the extremely reliable and regular nature of the service.

1241. Have you at all considered the possibility of a mail service to the Cape being combined with the mail service to Australia?—It was mentioned during these discussions some eighteen months ago. Of course, that would very much depend upon circumstances.

1242. What precisely do you mean?—Suppose you had these boats that carry passengers to Australia carrying the mails also, I do not think that on the whole we should get so good a passenger service. At present there is no doubt that, in that respect, we have little to complain of. We have the whole ship to ourselves and the mail company are very good from a passenger point of view. Supposing, for example, I am going home in three months from now, I can book a berth provisionally and make my own selection. I may then go into the office a fortnight before the date of my departure and tell them that for certain reasons I cannot go. Well, they will make no charge. They are extremely good in that way. With a through service to Australia I doubt if you could get all those advantages.

1243. Can you say anything as to how the present contract with the Union-Castle Company is working?—Of course, I think myself they are not working as economically as they should do. It is only fair to say that some time after the contract was signed—I think it was largely due to the influence of the Imperial Post Office—they wanted the day of arrival in England to be altered. The boat used to arrive on Saturday morning at Southampton, and the people in the north of England complained that as the outgoing boat left on the same day they had not time to reply to their correspondence. They approached the Imperial Post Office, therefore, to alter the day of arrival in England. Well that has been done, and the day of arrival is now Tuesday. But what is the result? It makes the day of departure of the mail steamer from here Saturday instead of Wednesday, and the consequence is that you have these expensive steamers, which probably cost 200*l*. a day to maintain, on this coast for about 18 days. The incoming boat usually discharges cargo here in about 16 hours, and leaves on Tuesday night for the coast. She spends a couple of days at Port Elizabeth, and East London, arrives at Durban at two on Sunday afternoon. She does not leave Durban until the following Sunday, spending six days taking in coal and cargo. To my mind that is an extravagant system. I suggested to Sir Owen Philipps in London in September last that it would be far better if they brought in the mail steamer on Monday, got her out of Cape Town sharp and hurried her up the coast. Let her leave Durban three days earlier, and thus keep her on the coast only 12 days instead of 19. In my opinion they would save in demurrage the extra cost of coal required to bring her in on Monday.

1244. What did they reply?—I could not say that any definite reply has been made. I think the alteration has been brought about very largely by the Imperial Post Office. I know it does not suit the merchants in London. Whereas formerly they got their mail on Saturday, they then had a whole week to reply;

now they get the letters on Tuesday morning and they lose a day pretty well in some of the London offices—because through this, Monday is an "off day." They have sent away the outward mail and the inward mail has not yet arrived.

1245. Under your plan how long does the ship have at Durban ?—I have not gone into details very much, but less than now. I suppose three days. Under the old system they usually left here on Wednesday daybreak and got to Durban on Sunday afternoon, and then left on the following Thursday afternoon.

There is one kind of traffic that we would like very much to develop—the tourist traffic from Europe. Of course, we think South Africa is well worth visiting, with our climate, scenery, the Victoria Falls, and the battlefields in Natal. There are a few tourists who come at present. I think the Railway Department intend to go into the matter pretty thoroughly, and they have put a certain amount of money—about 25,000*l.*—on their estimates for the coming year. I think the idea is to open an office in Pall Mall or Cockspur Street, London, or that neighbourhood, in order to endeavour to develop a tourist traffic to this country. That would be of benefit to the country and also, of course, to the mail steamship company.

1246. And you think the improved speed would be a powerful influence ?—Undoubtedly, if we could get down to 14 days, I believe it would immensely increase the number of people who would visit this part of the world, and I think it would increase the numbers passing backwards and forwards between here and Europe.

1247. You mean South African people would go home more often ?—I am thinking more of business people in that connection, and certainly you would have far more people coming out here.

1248. Will you go on to the matter of freights ?—I see you have taken a lot of evidence in reference to differential rates of freight charged between European ports and New Zealand, and it is only fair to say that we have nothing of that sort here. The rates of freight from all European ports—Hamburg, Rotterdam, Antwerp—are the same to South Africa as from any British port. There is a slight differentiation at present on some goods that come from New York and St. John. The Elder Dempster lines.—On automobiles, for instance—from London, 47*s.* 6*d.*; New York, 46*s.* 6*d.*; St. John, 41*s.* 3*d.* Canned goods—New York, 34*s.* 9*d.*; London, 32*s.* 6*d.*; St. John, 28*s.* 9*d.* Carriages—New York, 34*s.* 9*d.*; London, 35*s.*; St. John, 28*s.* 9*d.* Of course, the Elder Dempster Line is subsidised by the Canadian Government, and comes direct here.

1249. You might give us this list ?—Certainly.*

* List put in as follows :—

Following is a comparison between the freights charged from New York, St. Johns' and London :

Distances :

London to Cape Town - - -	5,918 miles.
New York to Cape Town - - -	6,995 „
St. John's to Cape Town - - -	6,025 „

Rates of Freight per ton :—

	From London.		From New York.		From St. John's.	
	s.	*d.*	*s.*	*d.*	*s.*	*d.*
Automobiles - - - -	47	6	46	6	41	3
Brooms - - - - -	32	6	32	3	28	9
Canned goods - - -	32	6	34	9	28	9
Carriages - - - -	35	0	34	9	28	9
Chairs - - - - -	25	0	24	0	20	0
Churns - - - - -	30	0	31	3	28	9
Cement - - - - -	15	0	15	0	12	6
Clothing in cases - - -	45	0	44	3	—	
„ „ bales - - -	35	0	34	9		
Duck - - - - -	47	6	46	6	28	9
Furniture - - - -	35	0	34	9	28	9

Lamps - - - - -	25	0	24	0	20	0
Ploughs - - - - -	30	0	29	9	24	9
Agricultural and Mining Machinery.	27	6	27	6		
Windmills - - - -	25	0	25	0	20	6
Wire, barb and plain - -	20	0	20	0	20	0

We have always held the opinion here that the rates charged to South Africa are more than they ought to be. I have a list here. It shows that on agricultural implements the figure to Cape Town is 30*s.*, and Melbourne 37*s.*; on asphalt—Cape Town 22*s.* 6*d.*, and Melbourne 25*s.* 9*d.*

1250. Are those rates now current ?—Yes; and since the contract was entered into on the 1st of September of last year the rates were considerably raised to South Africa, which I reckon, and I have pretty good authority for it, have cost South Africa over 200,000*l.* a year more.

1251. The rates were raised as a consequence of the contract ?—I would not say that. At that time rates all over the world were very high, and our rates had kept pretty steady. They had not risen in the same proportion as other parts of the world, but in September they were revised and raised.

1252. You could not say that was the direct consequence of the contract ?—No.

1253. Have freights come down much here ?—No, we have no outside steamers here at all. That is another grievance that we have. Of course, we have been agitating against this combination of steamship lines for years. In the year 1911, we got the Government to put some clauses into their Post Office Act which dealt with this matter. One clause is put in with the purpose of doing away with rebates. I will read it. (*Reading from Act.*)† Of course, that section prevents the Government from entering into any contract with any steamship company which gives rebates, and it also places the power in the hands of the Governor-General to differentiate in regard to any goods that may be brought by steamers of a combination. For instance, suppose an outside line came into the South African trade, and one of the existing Conference lines commenced to cut against the outside line, and used a fighting steamer to take away the trade from the outside line, under the provisions of this Act the Government could charge extra dock dues on all the goods carried by the fighting steamer. We pay dock dues at this port, for instance, of 1*s.* a ton, and 12*s.* 6*d.* per cent. But if there were a fighting steamer put on for the purpose of cutting out com-

† The section referred to, namely, Section 68, Act No. 10 of 1911, is as follows :—

6. (1) The Governor-General may enter into contracts in writing with any persons for the conveyance by sea of postal articles to and from the Union beyond the limits of South Africa.

(2) The Governor-General shall not enter into any such ocean mail contract with any person who—

(*a*) is connected directly or indirectly with any such shipping or other combination as the Governor-General may deem detrimental to, or likely to affect adversely, South African trade or industries ; or

(*b*) gives, offers, or promises to any person any rebate, refund, discount or reward upon condition that such person shall ship, or in consideration of such person having shipped, goods by vessels of particular lines to the exclusion of any others.

(3) The Governor-General may make regulations—

(*a*) differentiating as regards dock, wharfage, transhipping, or any other like dues at any port or harbour of the Union on goods landed from, shipped in, or transhipped from vessels owned or chartered by persons with whom the Governor General under sub-section (2) may not contract ; and

(*b*) differentiating as regards freight for the transport, over any railway belonging to the Government of the Union, of goods which have been landed or transhipped from, or are to be shipped in, vessels owned or chartered by persons with whom the Governor-General under sub-section (2) may not contract ; and

(*c*) prescribing the returns and other particulars which shall be made or furnished, and the manner in which such returns or particulars shall be made or furnished, by persons landing, transhipping, or shipping goods from or in any vessel or transhipping goods upon any railway of the Union ;

and generally for the better carrying out of the objects and purposes of this section.

petition, the port authorities could charge 10s. a ton, or anything they liked.

1254. Since these clauses were enacted, what has been the position?—They dropped the rebates, but they entered into a combination to keep out competition; and they have drawn up an agreement under which, before they will carry any imported goods, an undertaking must be signed to ship exclusively by those lines. I am one of those who have not signed the agreement, and in consequence I have had my goods differentiated against. For instance, I have sent goods down to one of the Bucknall boats, and that stuff has been sorted from the rest of the goods, and put on one side, and left out of the steamer, although the boat came with vacant cargo space. They do not shut cargo out altogether, but they put us to inconvenience as much as possible. That is what took place, also, with the Clan boats at Liverpool. There I have had 500 tons of goods lying, but the Clan boat would not take it by the first boat offering. It would be left lying there till the next boat. Of course, they make an excuse that, "We have entered into a contract with "the bulk of the shippers, and we must carry their "stuff first. If we have room we will carry yours also, "but not otherwise." We called the attention of the Government to this treatment, and the Government took action in accordance with certain clauses of the Ocean Mail Contract. They told the Union-Castle Steamship Company that, in their opinion, they were breaking that contract. Of course, the Company denied this charge, and the matter is now before a court of arbitration sitting in London. Sir Felix Schuster represents the Company, Sir R. Younger represents the South African Government, and Lord Mersey is the Umpire.

1255. **(Mr. Sinclair.)** You began by giving us some information about cables. Is it not the case that those who have not access to codes have really to pay more for deferred cables in plain English than if they used code and paid the higher rate?—Yes, probably that is so.

1256. Now, a question or two about the grievance that there is about the suggested combination or the suggested exclusive attitude of the steamship company in the matter of carriage of goods. In principle, the undertaking to give preference to their own customers is acted on, is it not, by merchants and dealers in different directions. That is to say, if a merchant has his own regular customer, and he is applied to to supply a casual customer at the same time—if he has not enough to supply both he prefers his own customer?—It naturally all depends on what he wants.

1257. In principle, and in practice, is not that the case, that suppliers always give preference to those who regularly deal with them?—Yes, but we have known steamers leave the port of London and shut out goods of non-signatories, with vacant space. There was one boat which came here with 600 tons of vacant space, having shut out a large amount of cargo of non-signatories.

1258. I am not suggesting a defence of that attitude, but am trying to point out this, that the undertaking to ship on the part of a shipper by a particular line meets with the undertaking on the other side that the ship will carry for him in preference to non-regular customers. It is a mutual contract, to that extent, is it not? On the one hand, there is an obligation to give the goods for carriage to one shipper, and, on the other, there is this undertaking of the carrier to carry those goods?—Yes, but he does not do that sometimes.

1259. So far as that principle is concerned, if it went no further than that, would you find fault with it?—Yes, certainly, under the present circumstances. Because I contend that the Union-Castle Company, at any rate, have no right to differentiate under the terms of their contract.

1260. But on principle, do you object to a trader giving preference to his regular customers as against casual customers?—I maintain myself that the same circumstances do not apply.

1261. But even in the circumstances I put to you, I gather from you that you would condemn it as a matter of practice if it went no further than I put it?—Yes, certainly, as far as the shipping is concerned—most assuredly.

1262. **(Mr. Tatlow.)** In regard to the question of the steamship companies, you say you would not be satisfied if they limited the matter of preference to the shipments of goods. You think that is an undue preference if they do not receive the goods of all the shippers alike?—Most certainly.

1263. Do you look upon it in this way—that steamship companies as public companies ought to treat the public fairly and without favour?—We have to look at it in this way. We look to what is the intention of this agreement. We know perfectly well that they made this agreement in order to keep out competition. If they have an agreement signed by 75 per cent. of the shippers, a new line stands no chance.

1264. Does much delay occur in the shipping of goods of people they do not favour?—I have suffered considerable loss. In fact I have sent a lot of stuff across to Antwerp and shipped it by German boats. We have actually shipped at Southampton to Antwerp, and then from there to South Africa by the German East African line. I had to pay the extra expense of shipping across to Antwerp.

1265. **(Sir Alfred Bateman.)** Is the Merchants' Committee in London a body that has altered much in these seven years?—No. What we do complain of is that they do not really represent the opinions of South Africa.

1266. You said so seven years ago, and is it the same now?—Most assuredly it is. This agreement with the shipping companies has been very largely favoured by the Merchants' Committee—in fact some of us think they instigated it. Because if there is one thing that a London shipper likes above everything else it is to be able to send down his stuff to the docks and get it shipped without any trouble. Now we in South Africa lay more stress on cheaper rates on freight, and so forth. I think I can speak for the majority of Cape Town merchants that the London Committee is not sufficiently in touch with our needs.

1267. It was one of the objects of the Commission on Shipping Rings that we should rather encourage a big conference of merchants of this sort to deal with the subject of shipping companies and their relations on equal terms?—We are certainly under the impression here that they look at it more from a shipowner's point of view than we do.

1268. Things in some ways have improved, I think. I think you said that there are no lower rates from America than from England?—There are a few, but not very much.

1269. There was a great difference at one time?—Yes, but from America now there is no conference line. There is an open market.

1270. Do you know much about it? Who has done it?—The Sherman Act has done it.

1271. You think that Act has done it?—Yes, I think the United States Government at one time threatened to bring the steamship companies trading to South Africa into court.

1272. American machinery from the Harvester Company still comes in here?—Yes.

1273. But not assisted by some preference rate?—I could not say. I think there is no doubt that some of these big American concerns do make contracts. I could not say about the Harvester Company. We get stuff from them ourselves, and it is nearly all bought in New York.

1274. Is it the case now that you pay more for sending your wool to England than Australia pays?—Yes, I think it is $\frac{3}{8}d.$ now. I do not know whether you have seen this freight agreement with the Government. But these rates are very low for homeward traffic.

1275. I think it was while the Shipping Rings Commission were out here that the mealie rate was reduced, and we always claimed that some of that benefit was due to us?—Yes.

1276. And you have a lower fruit rate?—Yes.

1277. And 10s. less for inspected fruit?—Yes.

1278. Now in regard to Government stores being carried cheaper?—Yes.

Cape Town, 3 March 1914.] Mr. JOHN WILLIAM JAGGER, M.L.A. [*Communications : Post, Telegraph, and Steamship (including Freights).*

1279. It has been accepted here, I understand ?—Yes, they made a special contract with the steamship company.

1280. And also about these differential dock dues as a remedy against the rebate system ?—Not in the nature of a rebate. All rebates have been done away with.

1281. Differential freights ?—Yes, there are no rebates now. But the Government have the power to put on differential dock dues at the ports.

1282. I think that in 1905 you brought over to London two Bills which the Board of Trade looked on with some suspicion, two Bills for remedying these evils ?—I think we tried to deal with the shippers.

1283. The Bills would, I think, have brought us into conflict with several treaties ?—Yes, but the Government now propose dealing with the goods.

1284. It does not conflict with any of the treaties ?—No.

1285. **(Mr. Campbell.)** In regard to these cables: the South African Government, I understand, offers a contingent subsidy, so that when the traffic does not total a certain sum, they pay a subsidy ?—Yes.

1286. Do they pay ?—I think there is a deficit at present and the Government is called on to pay.

1287. In the event of further reductions being effected, do you think the increased business would be insufficient to cover the increased expenditure or would it be a matter of further subsidy on the part of South Africa ?—It might for a year or two, but I certainly think in time the week-end cablegrams would pay. It would not very much affect the ordinary cablegrams.

1288. You do not think it would in any way interfere with the commercial business ?—No.

1289. In regard to the mail contract, I take it that you are of opinion that the Government does not get enough for its money. Is that the position ?—I would not go quite so far as that.

1290. Do you think there should be an increased subsidy for this quicker service ?—No. Our contention has been this in recent years : We say in South Africa the steamers have got a good many advantages and can work more cheaply than in former years. Taking this point, the dues they pay in Table Bay Harbour are less than ten years ago. In those days they paid sixpence a ton on the nett tonnage. Now it is one penny a ton on the gross tonnage, and they get much quicker despatch with cranes and much cheaper coal. I remember when every ton of coal here was Welsh and cost, I suppose, thirty-five shillings. There are also much better return cargoes.

1291. Your position is that the company should give a quicker service by three days for the same subsidy ?—No. I would not say that. But I think they should give a quicker service for the present subsidy. I would not say three days.

1292. That would be 14 days from Southampton to Cape Town. What is the subsidy, 171,000*l.* ?—The subsidy is 150,000*l.* and then there is 21,000*l.* for going round to Durban.

1293. Taking the mail contract on that basis, and with this new speed that you have figured out, what time could the mail contract service be performed in between Cape Town and Fremantle ?—I could not say.

1294. Is it a great deal further from here to Fremantle than from here to London ?—No.

(Chairman.) It is the same distance from here to Fremantle as from here to Madeira.

1295. **(Mr. Campbell.)** Suppose a mail contract were entered into from Cape Town to Fremantle, it could be done in less than fourteen days, could it not, and in less than 28 days from London to Fremantle ?—Yes, I should say so.

1296. Do you think a higher subsidy would be required from here to Australia than from here to London ?—I think there is no doubt that you would require a bigger subsidy.

1297. On the basis of the service that you maintain should be run between here and England, it is reasonable to say that they could, by having a further mail service from here to Fremantle, get something like a twenty-seven or twenty-eight day service ; do you think so ?—I should think so.

(Chairman.) It comes out 24 days to Fremantle on the basis of the speed you advocate from England to Cape Town.

1298. **(Mr. Campbell.)** As far as comparisons are possible between here and London, do you get cheaper freights than, say, to Australia ?—No, you in Australia get cheaper than we do, taking distance into consideration. It is 12,000 miles to Melbourne. Reckoning it per mile, you get cheaper freights than we do.

1299. Do not you think there is something in this, that the trade between here and Australia really acts as some sort of a check on your shipping companies ?—No, only as to passengers. All the British ships that come round this coast on the way to Australia do not bring a single package of stuff to South Africa.

1300. On the voyage from London to Australia, there is no cargo ; is that it ?—No, nor the other way. But passenger traffic, yes. There are the White Star, Blue Funnel, and Aberdeen lines. They have cut into the passenger traffic and run a very good service too. They do bring goods from Australia to this port, but they do not take a single pound of stuff from here.

1301. **(Chairman.)** You say that the Australian boats neither bring goods here nor take them away ?—Yes, Australian produce comes here, of course.

1302. From England ?—No, not a package except what the German boats do. There are three German lines, but they do not touch at any British port. But no British boat brings goods to South Africa on the way to Australia.

1303. Why ?—On account of the Conference ring at present.

1304. Do not the Conference restrictions extend to passengers then ?—Apparently not. You will find the service given, especially by the Aberdeen line, very good, and they must take quite a number of passengers, and taken altogether, it is rather cheaper than the Union-Castle boats.

1305. So the Australian boats cut into the passenger trade, but not into the freight ?—No, we wish they would cut into the freight market.

Cape Town, Wednesday, March 4th 1914.

The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A., called and examined.

(*For the evidence of this witness on "Land Settlement," "Bunker Coal" and on "Fruit," see pp.* 8, 103, *and* 318.)

1306. **(Chairman.)** You have devoted considerable attention, I believe, to communications by mail and cable ?—Yes.

1307. Perhaps it would be convenient to take the question of the mails first. We would like to know your views in regard to present arrangements and prospects in connection with the mail service to the Cape ?—My idea is that I do not think that we have derived all the advantages that we should have derived in quicker transit owing to the great changes and developments that have taken place in steamer construction during the last twenty to twenty-five years. For instance, I think from 1888 to 1893 we had a mail contract of something in the neighbourhood of 20 days, and then from 1893 to 1900 we had another contract which reduced the period of time by a day, to 19 days

Cape Town, 4 March 1914.] The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A. [*Communications: Post, Telegraph, and Steamship (including Freight's).*

and from 1900 to 1910 our mail contract ran for 16 days 20 hours, and after three years it was reduced to 16 days 15 hours. Then, at the end of 1910, we had to enter into a new contract, and while negotiations were going on, the contract was renewed for a couple of years. Our new contract has been entered into on a basis of 16 days 15 hours. There is a clause in the contract by which, on paying a certain amount of money extra, the time can be reduced in one direction, I think, by a day. But my point is that in view of the fact that under the earlier contract, that is, I think, from 1893, when the period of time was fixed at 16 day 15 hours, there has been a considerable advance in construction of ocean-going steamers which ought to have given us, for the same terms we are now paying, much greater speed. Now I remember, for instance, coming out in the "Scot" in 1890 and the "Dunottar Castle" in 1891. That was the time when the Union Company and the Castle Company were in opposition, and we had then two mail contracts with the separate Companies. Both those ships did their trial voyages when they were competing with one another quicker than now. That is over twenty years ago. My great point is that it is in the interests of the Empire to do everything possible to quicken the means of communication, and that it is vital to the interests of the outlying portions of the Empire, such as South Africa, Australia, and New Zealand. I believe that every day that you can reduce the period of transit between these countries is in the interests of every portion of the country. Take, for instance, people coming out to South Africa. Some people say it makes no difference; what does it matter whether it is 14, 15, or 16 days; but I would say there must be a number of people who leave England every year for a certain period of holiday; they go to Egypt and the South of Europe. Now if you could have a 14 days' service to South Africa or a shorter service, I believe you would encourage a large number of people to come out here and they would then begin to realise the resources of the country. By bringing people into close contact with one another, you maintain the Imperial connection far better than you do at present.

1308. You anticipate that with an improved speed an increasing number of people would visit South Africa: would you also anticipate that a large number of South Africans would visit England more frequently?—Yes, and I will tell you why. The majority of people here are not people of leisure, they are business people, they may be able to take a holiday of a couple of months, and many men, if ocean transport would allow them to do the double sea journey in 28 days, would take the trip oftener, even if they had only two or three weeks on the other side. I feel perfectly certain that if you had quicker transit you would have a far greater number of people going to and fro, which would be to the interests both of this country and Great Britain.

1309. It is clear that increased speed involves increased expense?—I recognise that increased speed means increased expense, and I also recognise that that is a question for experts such as naval architects to go into. It must not be forgotten that from 1903 we had a contract for 16 days 15 hours, and there is no doubt that since then enormous developments have taken place in modern construction. To-day you have triple expansion engines, turbines, improved modes of construction, and, over and above everything else, you have extremely cheap coal here. In the old days steamers coming out to South Africa had to get coal here which had been shipped from England, which was, of course, very expensive. There is now plenty of coal to be obtained in the country, and I have always said that we should have a table prepared by experts under a proper system showing what was the cost of running steamships in 1893 from Southampton to Cape Town in 16 days 15 hours and what is the cost to-day with all the new developments which have taken place in marine architecture and the entirely altered condition in regard to coal in South Africa, but naturally I only speak generally on the matter. What is wanted is to have the views of experts on the subject, because the ordinary man in the street would naturally consider that with all these great improvements and changes it should be possible to reduce the period of transit without increasing your cost of working very considerably; otherwise, if it would increase your cost of working, then the developments that have taken place are of very little advantage so far as cheapening the transport of ocean freight is concerned.

1310. The price now at which you can obtain coal here seems to vary from 21s. to 26s. per ton. At the period you speak of, when the "Scot" did the voyage, can you tell us what the cost of coal was then?—I can not tell you that, but the Commission should easily be able to ascertain. In those days the mail steamers, I think, left Southampton on Friday, and the "Scot" got in on Sunday night or Monday morning.

1311. At that time was there any South African coal to be had?—I think that all the coal used then was imported, but these are facts which you could more easily obtain, perhaps, from the Railway Department.

1312. Have you considered at all the possibility of a joint mail service with Australia?—Yes, I always thought that there would be a possibility of doing something. My object is to give every possible facility to shipping in Cape Town docks and to encourage by every means that you can as much ocean transport to come round the Cape as possible, and I do not see why competition should not apply to shipping companies the same as everything else, and the more one can do to prevent a combine in connection with the regulation of rates, so much the better for the country.

1313. Now take the position of the Committee of Merchants in London, who are signing an agreement with regard to rates of freight agreeing to give all their traffic to the existing Mail Company for a certain period of years?—Well, that may be all very well in the interests of the merchants themselves, who beyond everything else desire that they shall be able to forecast for a certain period of time rates at which they can lay down goods at any given point, but I would like the Commission to consider who has to pay for that—the South African public has to pay, and every shilling by which you can reduce the cost of tonnage, although it may interfere with the individual merchants making out their estimates, is to the advantage of the country in the long run, that is the extra purchasing power to the country, and I think that that is an important consideration, and far more important than any individual desiring to fix his rate of freight You know, however, there are great differences of opinion on this subject, and I should like to say that I am looking at it entirely from the point of view of developing a new country.

1314. Would it be desirable, in your judgment, when the contracts for the Australian mails have to be renewed, for something in the way of a combination to be made between South Africa and Australia with a view to the examination of the question and to consider whether a diversion of route is not possible?—I can answer that by saying that everything that reduces the time and cost of transport is in the interests of Australia as well as South Africa, and under those circumstances I do not think it would be anything but good business for them to discuss the situation, and, if they found it advantageous, to combine.

1315. You would favour the authorities here, then, examining the question as to whether some combination is possible?—Absolutely, because I maintain that the prime duty of the authorities here is to look entirely and solely to the interests of the country. I do not want to be misunderstood, because I hold very strong views about not giving our mail contracts to anything but British shipping, but I would like to have as much competition in that shipping as possible.

1316. Now, turning to another form of communication, namely, cables. What is your view on that subject?—I think that the reduction of cable rates is going to be of considerable advantage from many points of view, even the reductions we have had up to now have been of great benefit, for instance, the reduction on "deferred" cables and week-end cables

Cape Town, 4 *March* 1914.] The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A. [*Communication : Post, Telegraphs, and Steamship (including Freights).*

I think that has done a great deal of good, because it enables people in one part of the Empire to get into more rapid communication with those in another part, and that is to the general advantage of the Empire. What the position would be from a financial point of view, of course, I am not qualified to speak on, but I believe that every reduction of rates will largely increase the amount of communication. There is no doubt that very few people can afford to pay high cable rates A good many people would make use of the cable service if they could do so at a cheap rate. I believe many people make use of the week-end rates.

1317. Have you considered at all the desirability of reducing the minimum of the week-end cables?—As you are no doubt aware, the smallest message is 30 words, costing 15*s.*; and it has been proposed to reduce that minimum to a smaller number of words costing 10*s.* or 5*s.* I am perfectly certain that if you did so it would increase the number of messages materially, and it would meet the requirements of people to whom 15*s.* is a considerable item.

1318. Would it be a boon, do you think, to the poorer class?—Yes.

1319. Can you tell us whether these new facilities for deferred and week-end cablegrams have been sufficiently brought to the notice of the public?—I do not think they have. That is a question I was discussing the other day with another gentleman, and I find that there are large numbers of people who do not know of the existence of these facilities for sending week-end cables at 15*s.* for 30 words. I think that in that respect the Postal Department could do a good deal by having the fact prominently notified in the post offices.

1320. So far as you are aware that has not yet been done sufficiently?—No. Of course, I cannot speak with authority on that subject, but I find that by talking to people, many do not know about it.

1321. People of what class?—Well, perhaps not people actively engaged in business. Of course, every business man knows about it.

1322. You mean people in touch with the commercial class?—Yes.

1323. And if those people are ignorant of this facility, then, *à fortiori*, classes which are less in touch with the commercial community would ignore it?—Yes, decidedly.

1324. Can you suggest any other means by which these facilities could be brought to the notice of the public?—I do not know anything that could be done except making these changes as public as possible, and by doing so in a manner which catches the eye of the ordinary individual.

1325. I understand that you would be in favour of the proposed reduction of the minimum from 30 to 15 words or even 10 words?—Yes, I can give you an example. I think very often people who send a week-end cable could express what they desire to say in fewer words than 30, and very often they find they have to spin their message out in order to make it the minimum number.

1326. That is, of course, of no advantage to anybody. It is to the disadvantage of people who wish to send a shorter cable, and also to the disadvantage of the general service, because it blocks the lines with words that nobody requires?—Yes, except that they would say, I suppose, that they got a little more money for it.

1327. Is it that the Post Office and cable service have been afraid of diverting traffic from the full rates to the cheaper rates?—Yes, I imagine so.

1328. And that fear has possibly led them to neglect the duty of bringing these facilities more prominently before the public?—Yes, that may be, but I cannot speak with authority.

1329. Are there any other points connected with communications which you would like to bring forward?—No, I do not think so. I think that deals with the whole question from a general point of view. I do not attempt to speak with any expert knowledge.

1330. But you speak with a very wide knowledge of public requirements?—Yes.

1331. **(Sir Rider Haggard.)** I understand you think that a line of big and fast steamers with deep draught would be a great advantage to the Cape as well as to Australia?—Yes, because it is a self-evident fact that if you have a large amount of transport passing this way, during the period the boats stop here to call the people see the country and meet the people and learn something of its possibilities; they also draw large quantities of foodstuffs for the voyage from this port. During the few hours passengers are on shore they also spend a certain amount of money, which is of some assistance.

1332. It has been stated that every steamer that calls at Madeira leaves 300*l.* behind it?—I suppose so.

1333. Have you ever looked at the matter from the Imperial point of view; for instance, that it would avoid the carrying of mails through foreign territories?—Yes.

1334. Also avoid difficulty in times of trouble or even of accident, such as the blocking of a narrow canal?—Yes. I am in favour of offering larger inducements to keep as much trade as possible in Imperial channels. It is the same with cables, and I am in favour of the Imperial Cable route.

1335. **(Sir Jan Langerman.)** In regard to the subsidy, you say that in view of the improvements in naval architecture we did not get any benefit out of the new contract, such as an increase in speed?—Yes. My suggestion at the time the contract was under consideration was that naval architects should be asked to work out as a business proposition what was the cost of running a ton of goods, say, from Southampton to South Africa in 1890, compared with the present day, in view of the developments which have taken place in naval architecture, and the cost of coal at this end as well as the character of the traffic. I would have liked to have seen a statement of that kind showing this information, but I have never seen such a statement.

1336. To-day the Union Government pays a subsidy of 171,000*l.* Do you know at all what the subsidy was previous to this last contract, whether it was less or more?—I think it was about the same. If you remember, there was competition before the Union between Durban and Cape Town, and the Natal Government, for the purpose of getting steamers to enter Durban Harbour, paid a certain amount of money to encourage them to go inside, and that payment was continued by the Union Government.

1337. In your opinion, assuming that the subsidy to-day is the same as the subsidy before this new contract was made, the old contract being based on the expensive Welsh coal, whereas to-day coal is much cheaper in the Union, taking those things into consideration, do you not think that we ought to have a much better service for the money we pay?—Yes. As I say, I should like to see figures to show me that I am not correct in stating, as I do, that with the recent developments and the cheaper fuel, we ought to get greater facilities in 1914 than we used to get in 1893.

1338. In regard to cables. It is the general idea that in postal and cable matters, if the price is reduced, there is an increased volume of trade, but would that increased volume of trade pay for the extra expense connected with the cheapening of the rates?—On that question one can only express an opinion, one must be an expert on cable matters to give views of any value.

1339. No doubt you are aware that the Government guarantees the Cable Company a certain amount of money, and there has been a deficiency of something like 7,000*l.* or 8,000*l.* a year for the last few years. We have cheapened the cables and yet, in spite of this reduction, there is still a deficiency in the cable receipts. Do you know if this reduction has had any effect upon the amount contributed by the Government?—I cannot say, I have not gone into the figures.

1340. **(Mr. Garnett.)** You are not in a position to give any comparison as to the prices prevailing between 1890 and 1912, I understand. Your complaint, I gather, is that, having regard to the great development in naval architecture, and the improvement in the means

of communication, and so forth, and also the decrease in the cost of your coal, you have not received commensurate advantages?—Yes.

1341. Have you taken into consideration the factor that is brought into the matter by the relative cost of construction as between now and 1900 or 1890?—No, I am only speaking generally.

1342. By the cost of construction I mean, not only the cost of materials but increased wages?—Yes.

1343. You are also aware of the enormous increase there has been in the cost of coal in the United Kingdom?—Yes.

1344. You do not know whether the increased expenditure under these headings would increase the cost of running?—No. But I would say this—I find that the late Castle Steamship Company, of which Donald Currie and Company were the Managers, had an appreciation of something like three millions of money, owing to the fact that they had built up reserves in various ways by insurance funds and writing down cost of ships. Speaking generally, you only want a certain amount of common sense to see that that enormous profit has been paid by the consuming population in South Africa, and it is a profit far and above what you would expect from a Company that was only paying for a considerable period of time a dividend of something in the nature of 5 per cent. All I can say is, I do not know how it is done. They establish their insurance funds and gradually build them up to a large amount, they write down the tonnage of their steamers and they do other things of that kind. Well, I ask as a simple farmer, how is it done? Is it done out of the profits that do not appear in the ordinary balance sheet, because it is a method of doing business that from my farming point of view I would like immensely to understand. If that is the case in the past I am afraid it may go on in the future. I do not want any unnecessary advantage; the only advantage I want is a fair advantage, in view of the great developments that have taken place, because, unfortunately, all over the world shipping companies are combining. I can give you an example. It struck me very forcibly at the time, but some years ago I was ordering a large quantity of iron standards for fencing operations in the Karroo. I desired to get these goods from an English manufacturer. I saw my Agents at Port Elizabeth, who were ordering these things on commission. I said to them, "I am in no "hurry for these things. Get them by any tramp "steamer you like." What was their reply? They said, "Oh, if that is the case we are very sorry; if "that is your condition, we cannot take the order "because we shall lose our rebates"; which came to a very considerable amount. Now that has been done away with in the new Post Office contract, but the Company has attempted to get every merchant to sign an agreement to send his goods by the conference lines, with the feeling that if this agreement were not signed his goods might be shut out. That agreement has a tendency to introduce on a larger scale the old principle under another name. Now, I say that is not in the interest of the public.

1345. With regard to the question of increased tonnage in ships; assuming that very much larger ships were built, in your opinion would there be a commensurate growth of trade that would insure an equal number of ships coming to the Cape, because, assuming that the tonnage in ships increased very much, would the advantage arising from the larger ships and cheaper carriage compensate for any reduction in the number of vessels calling here carrying merchandise?—I think you would want a man who was more versed in commercial matters to answer that question.

1346. Would you admit that it is of some advantage to the community at large?—Yes, but I am not competent to give an opinion.

1347. **(Mr. Bowring.)** With regard to what you have told us about the time when there was competition between the steamship services, how was it that when the Government came to renew their contract and found that the passage could be done in, say, 14 days, it was not provided for. Because when the Government came to renew the contract, as most people know, what took place in the shipping world was this, that there was really no open competition for the Cape mail service. There is such a thing, I believe, as one shipping company exercising its influence to keep another company out of its sphere of action. One company can say to another, —You had better keep out of this business or you may find me coming into yours. Now you understand what I mean?—I believe that took place. I have been told so, I have a shrewd idea that there may be a modicum of truth in it.

1348. You mean that they must have agreed amongst themselves that they would reduce the rate of speed rather than increase it?—I think when we called for our tender there was practically no competition.

(Sir Jan Langerman.) Donald Currie and Company had the controlling interest in the Union Company and there was no competition.

1349. **(Mr. Bowring.)** It seems a very curious thing that if it could be done in something like 14 days in 1890, twenty years later you should be running the distance in 16 days 15 hours?—It may have been more than 14 days, but it was much quicker than now. For instance, I think the last steamer of the Union Company was the "Saxon," which was much quicker than many of the ships that were built at a later date. She was built in the days of competition. She is still running and I believe is capable of doing the passage in much less than the present time, but, occasionally, I understand, she slows down before she gets into port because it would never do to get into Cape Town before Tuesday morning; that would be a most serious thing.

1350. Have you any idea what time the boats can do it in?—No, but I have a shrewd idea that in all these things the speed of the fleet is regulated by the slowest unit.

1351. And possibly the slowest unit is the oldest boat?—No, unfortunately, that is not so, because some of the boats which have been built at a later date are slower than the "Saxon" and those that were built in the days of competition. That is an extraordinary thing, no doubt; if the boat which was built years ago was the slowest I could understand the position better, but I find that it is some of the newer vessels which have been built since the amalgamation that are the slowest. I can give you two examples, namely, the "Kildonan Castle" and the "Kinfauns Castle"; they are both slower than the "Saxon."

1352. Then it is really a retrograde movement?—Yes, as far as speed is concerned. It may not have been a retrograde movement from the point of view of the Union-Castle Company, considering that they have been built to keep out all competition.

1353. But it is retrograde to build newer boats which run at a slower speed than the older ones?—Yes, but I hope that policy will be altered in the future.

1354. Now about accommodation, has that improved during the last five years?—I do not think there can be any complaint about passenger accommodation and regularity of the service and the extraordinarily good seamanship on this line.

1355. I think that is admitted on all sides?—Yes, it is a splendidly manned service, they have a magnificent body of officers and they have extremely few accidents, they show every care for lives and property and the interests of the passengers. I do not know whether their fares may not be a little more, generally speaking, than the fares from Australia by other lines, taking distance into account, but their ordinary tariff will show you that.

1356. Can you tell us how the un-subsidised lines compare with the subsidised lines?—No, I have no idea. I have been told that some of the Australian boats which pass here are very well done in regard to speed and accommodation, but I have never travelled in them.

1357. It is generally considered there is not much difference in speed or accommodation?—I do not think so.

1358. The German lines run regularly to the Cape do they not?—Yes, but I do not know very much

Cape Town, 4 March 1914.] The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A. [*Communications: Post, Telegraph, and Steamship (including Freights).*

about them. I hold very strongly that we should travel by our own steamers.

1359. Can you tell us if the German lines are cutting into the Cape trade to any extent?—I believe there was an idea that they were cutting into the East African trade very considerably at one time.

1360. But with regard to the Union?—That is a thing I do not know. I think you require to get the records from some of the Governments or from the Chamber of Commerce. There must be a great deal of traffic done with this country. There was, I understand, one period of time when it was cheaper almost to ship goods from Hamburg than from Southampton by one of our own steamers. I think Sir Alfred Bateman will know about that.

1361. In regard to reductions in the price of week-end cables. Have any representations been made by the Government or by the cable companies with that end in view?—I do not know, I am only speaking generally on the advantages such reductions would have.

1362. But you think if those representations were made they might be successful in reducing the week-end cable rates?—Oh. I do not know about that, because I cannot say what answer the Cable Company would make to the request. I think it would be very advantageous to this country, and that it would increase the number of messages if it came into operation.

1363. **(Sir Alfred Bateman.)** I do not know whether you remember the Commission on Shipping Rings some seven years ago?—Yes.

1364. I daresay you remember that as regards the freights of exports at that time there was practically no complaint?—No.

1365. And that the Union-Castle Company served the people well?—No.

1366. Even with regard to South African wool paying a higher rate than the Australian wool we had no complaints?—Except that one got rather a shock on learning at last that it was stated on fairly good authority in the House of Assembly during the debate on the Post Office Bill that a ship put into Durban, and there was a large quantity of wool ready for shipment, and that ship went East to look for cargo, because, owing to her agreement, it was impossible to load homeward freight from here. That made people think that there were combinations that were not of benefit to the country. It was said that that ship went 6,000 miles to take a cargo of wool at a lower rate than from Durban.

1367. But, speaking generally, there were practically no complaints about rates of produce except in regard to maize, and that was altered about the same time?—Yes.

1368. As regards imports there were some complaints, but I daresay you remember that the Commission was very much struck with the advantages of those regular services?—Yes.

1369. Then I think you remember there were difficulties about port competition and jealousy between the different States, especially Natal, and the adroit way in which Donald Currie & Co. played one State off against another, occasionally altering the rates to the advantage of Durban?—Yes.

1370. The Commission expected that when you had a united South Africa you would be in a better position to bargain?—Yes.

1371. I do not know whether you are of opinion that the bargain has been well made?—I would not say that; my view has been that there is only one way of bargaining with a combine, that is to say: "I am very "sorry, gentlemen, that if you are not prepared to do "this, then we are prepared to build seven of our own "ships to carry our mails, we are prepared to depend "upon the ocean transport of the world to carry the "rest of the goods." We would then be dealing upon equal terms. We do not deal on equal terms at the present time.

1372. Do you think you could have built vessels enough to carry your mails?—Yes. I believe we could have built seven ships, but the trouble was to get the country to accept the proposal. There were many ideas about the matter, and the fear as to what would be the qualification of the people who took charge of a service of that sort.

1373. I do not gather that you prefer the State doing it?—Decidedly not, except as a last resort.

1374. Would you sooner see things done outside than by the State itself?—Yes.

1375. Now, as regards the South African Merchants' Committee—you rather condemn them, I gather?—My view in regard to the South African Merchants' Committee is this: That they have a perfect right as business men to look after their own interests, but their interests are to avoid any alteration in prices which could affect the figure at which they could quote for certain goods in South Africa. Well, that is all very well, but it is not in the interests of this country. The interests of this country are to get the stuff delivered here as cheaply as possible, and I decidedly object to a certain body of gentlemen gathered together in London making arrangements about freights to this country.

1376. Surely they represent an enormous proportion of the trade?—Yes, but there is more than the trade concerned; there are the general consumers as well as the commercial population.

1377. But anything that produces a regular and cheap service would surely be to the advantage of the consumer as well as the Merchants' Committee?—Yes, if they maintained a cheap service, but they were willing to fix the rates, and may very often give a dearer service instead of a cheaper one, because it keeps other people out of the trade, because if all the merchants in South Africa combine for twelve months to give all their goods to certain lines of steamers, what advantage would there be to an outsider to enter into the trade?

1378. You would rather like to see competition so that you could get the cheapest rates possible?—Yes, I maintain that a company which gets a subsidy, or as they call it a "consideration" for carrying the mails, ought not to take up the line which they have taken up in the past. Having got that consideration for services rendered they ought to be able, as a fair matter of business, to keep the rest of the trade by giving ordinary competitive rates, but I do not think they always do it.

1379. The Shipping Rings Commission had the idea that a strong South African Merchants' Committee could represent thoroughly well the trade here, and they would be in a good position to bargain with the shipping companies and get the best possible rates and freights?—Yes, but above everything else although a strong committee might be desirable, if that committee give something away in the shape of increased rates and freights for the purpose of having a twelve months' contract, and if that cost 2*s*. 6*d*. or 5*s*. a ton extra on goods shipped to this country, these gentleman would not pay, it would be the consuming public of this country who would have to pay it, they would have that 2*s*. 6*d*. or 5*s*. added on to their prices, and I maintain that that is not to the advantage of the State.

1380. Sooner than that you would be in favour of State action?—Absolutely. I consider it is another means of introducing the rebate system; the object of the rebate system was to prevent people going to anybody else and keeping out competition.

1381. Surely now with this large mail contract the Government is in a very strong position?—I think so.

1382. And it ought to be able to make a good bargain?—I do not think that there is any doubt about it.

1383. Now do you think it is possible that at the next opportunity they may make a better bargain?—You mean when we have a new mail contract? I certainly think so.

1384. Do you think you would get increased speed for your mails, and also an open market for freight?—We thought we were going to get an open market for freight now.

1385. **(Mr. Campbell.)** You spoke of favouring a discussion between Australia and South Africa on the subject of a basis for a combined mail service: there was such a proposal on foot some two or three years

ago I believe ?—Yes, I believe there were the *pourparlers.*

1386. Were there any details given ?—I do not know.

1387. I suppose you would recognise that while the advantages of a combined mail contract, if it could be arranged, are apparent, the holding of a conference between the two peoples is dependent on the submission of some scheme or schemes by which it could be carried out ?—Yes.

1388. Have you any sort of a scheme in your own mind in this direction ?—No, I think you want to be very familiar with shipping to express an opinion of any value on this subject.

1389. **(Mr. Sinclair.)** Notwithstanding all you have been able to tell us, and other witnesses have told us, about the evils of combination, combination still exists in the case of South Africa at the present time, does it not, in the matter of shippping ?—I should imagine it does.

1390. When the new mail contract of which we have heard was entered into, the Union was forced, as it seems to me, to accept a lower speed than had been attained twenty years ago. Was not that in consequence of combination ?—Well; no. They have not accepted a lower speed rate than twenty years ago, it is a better speed rate.

1391. I understood you to say that the speed rate twenty years ago was quicker than it is to-day ?—Yes, of certain ships, but that was not under the contract.

1392. I am seeking, in the meantime, to make a comparison between the contract rates which the Union Government assented to quite recently and the rate at which the voyage was done by the "Scot" some years ago. I suggest that the Union is in its present position as regards that contract owing to the combination and that it was obliged to accept that speed rate in consequence. Is that so?—Well, the Union found that they could not, as I understood it, get better terms for speed without paying a very much higher amount of money.

1393. But you told us there was practically no competition ?—Because we advertised in London, and I do not think we got many competitive tenders.

1394. I suggest that the absence of competition was due to an understanding ?—Of that I do not know definitely; the only thing I have in my mind is that there are many shipping combinations all over the world.

1395. Is it not the case that every Colony of the Empire finds itself at the present day at the mercy of freights—putting it broadly ?—I think there is a great deal to be said for that.

1396. Is it not a fact that the ships which pass your port to and from Australia and London carry no cargo from the Cape to London or from London to the Cape ?—I cannot definitely say if it is so, but if they carry no cargo between the Cape and London, it would appear it must be due to some arrangement.

1397. That is precisely the object of my question ?—An arrangement which I would imagine was not entirely in the interests of South Africa.

1398. Is there any other way—in view of the existence of shipping combinations all over the world—by which a Dominion can protect its people, who have, as you very pertinently pointed out, to pay this increase, except by putting on ships of their own ?—Oh, yes, I think there are.

1399. Will you kindly let us know what they are ?—In the first place, we had a considerable amount of Government transport, and we could always use that as a lever to encourage other people to come into the trade.

1400. That is a factor, but it has not been operative here, has it ?—It did operate before, because I remember a period of time when I thought the Currie Company was unduly raising our rates, that I submitted to the Agent-General in London instructions to call for tenders for Government freight. He replied that he could not get any, so I said he must go to the best broker he could find in the City and hire an ocean tramp. He said that it would not be possible to fill her with cargo with the amount of goods that we had available to be sent to South Africa. I then told him to advertise her tonnage at a considerably reduced rate and fill her up with general cargo. I found that such was the effect of this action that our terms were accepted by the Currie Company within two or three days afterwards.

1401. Is there anything else that occurs to you ?—No, personally I think you must keep the Government out of as many trade operations as you can. As a rule, I think Government trading institutions are not worked on a very economical basis. That is my experience.

1402. Does not all this evidence point to this conclusion—that the Dominions are largely at the mercy of the shipping interests ?—I think so, to a large extent.

1403. You do not favour State competition I gather, but putting that question on one side for the moment; if a State saw that its only chance of protecting itself would be by building its own ships, it would have to build them or not build according to its ability, and if it were unable to do so, it would be practically powerless ?—It would have to pay. I do not think the shipping companies are run on a philanthropic basis.

1404. Certainly not. Now were those rapid voyages of the "Scot," and other vessels that you mentioned, under competition of one company against another ?—As far as I remember, the "Scot" belonged to the Union Company, and the "Dunottar Castle" was the reply of the Castle Company—that is Donald Currie and Company.

1405. In other words, that was the result of competition as against combination ?—Certainly, and unfortunately the Cape Government, although they had a mail contract running over a certain period of years, allowed the two companies to combine.

1406. How were the mails carried before ?—They were carried alternately. Each Company had a fortnightly service. After the contract was given out in 1900, those two companies combined. They had the permission of the Cape Government to do so, because the Cape then thought that by the combination everything would have been materially improved. How the improvement went, I should think the purchase of the Union-Castle Company by the present Company will indicate. People can look at the price paid and form their opinions for themselves.

1407. Does not the example you have given furnish a good illustration of what took place in the carriage of mails by competitive companies ?—Yes.

1408. You would probably get greater speed and activity on the part of each company if there was competition. Each company would then endeavour to outspeed its rival ?—Competition always brings activity.

1409. With the larger boats you have spoken of as being necessary to give increased speed, they would, of course, have greater carrying capacity, and require larger cargoes ? I suppose it is reasonable to assume that the gradual development of the Dominion would provide sufficient additional cargo to occupy the additional space ?—I think so. So far as South Africa is concerned, we have only touched the fringe of our development in this country. Our population has been too much engaged hitherto in speculative undertakings in the past.

1410. As to cables, the week-end rate was designed originally, was it not, in order to be used for social purposes, as distinct from commercial purposes ?—Yes.

1411. I think you agree that 30 words are far too numerous for the mere sending of a social message ?—Yes.

1412. That number might be very considerably reduced without any substantial loss to the companies ?—Yes.

1413. Is it not a fact that under the present rate of 30 words for 15*s.* the week-end cable is used for business purposes ?—I do not know.

1414. Well, at any rate, the reduction to a lesser number of words would maintain the purpose for which the message was designed, and if it is used for business purposes for which it was not intended, it would prevent that ?—Yes, I suppose the real intention of the week-end cable was to anticipate a letter.

1415. **(Sir Rider Haggard.)** I think you told Sir Alfred that as a last resort, you would approve of a

Cape Town.
4 March 1914.] The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A. [*Communications: Post, Telegraph, and Steamship (including Freights).*

State-built and controlled mail service of steamships?—Yes, if I could not get any relief in any other circumstances, and what I considered fair treatment.

1416. Well now, what do you consider fair treatment? What would be your last resort under which you would urge State action?—Do you mean as regards speed?

1417. Well, take it all round, as regards speed, rebates, freights, and so on?—If you want my personal opinion, I would have maintained that the interests of this country would have been materially assisted by a 14 days' service.

1418. Supposing in future you are unable to get a 14 days' service, would you then be prepared to urge that the State should, either by itself or in conjunction with another Dominion, take the matter into its own hands, and have a State-owned line?—I would not say that. I would far sooner see it done by independent companies, but I would like to see the whole calculation worked out, as I said before, by experts, to see whether it was possible to ship to-day cheaper than twenty years ago, in order to meet that argument that increased speed means increased cost under new conditions.

1419. Suppose that it was shown to you by your experts that it was perfectly feasible to increase the speed at no very great increase of cost, and yet you could not obtain it, would you then be prepared to urge that the State should take the matter up?—I would personally.

1420. **(Mr. Garnett.)** I think you said that you tried to charter a tramp steamer and you were unable to fill her?—Yes. The trouble we had was in this way. In chartering the steamer we could not fill her with South African Government supplies. My reply to that was that we could fill her up by giving an extremely low rate of freight to other people who were desirous of sending cargo here. I use that simply as an illustration to show what a lever like that can do.

1421. If the exporting merchants in London had to trust to tramp steamers, would they not also be in a somewhat similar condition? Would they be able to fill the boats?—The individual, of course, is never in the same position as the State.

1422. I am coming now to the question of freights on merchandise. In business is not time of the essence of the contract?—Yes.

1423. If time is of the essence of the contract in business, is it not of very great advantage to the importers in this country to be able to ship by steamers leaving at regular intervals and arriving at regular stated times?—Of enormous advantage.

1424. And if it is of advantage to them as great importers, is it not also of advantage to the people they have to supply?—You mean in regard to a regular service?

1425. If I were an importer here and had to rely on certain sailings and arrivals, is it not to the advantage both of myself and my customers up-country that they should be regular?—Yes, it all depends on what you pay for it.

1426. That being so, time being of the essence of the contract, as a trader, is it not sometimes worth more to me to ensure that regularity than have a lower freight with uncertainty as regards the time of delivery?—Yes, as a trader I am perfectly certain also that if he had to remain solvent, somebody has to be made to pay.

1427. But is it not to the advantage of the community that that should be ensured?—Not if they pay too much for it.

1428. Does not the question of advantage depend on whether you are paying more for what you are getting than the thing is worth?—Yes, that is the whole thing. I think the advantage of a regular service is very great.

1429. In regard to these forward rates, is it not to the advantage of the community at large that the importers of the country should be able to quote for long distance delivery at a fixed rate so that their customers may know what they will have to pay?—Yes, if you do not pay too much for it.

1430. And does the mercantile community generally pay too much?—I should say they do.

1431. You do not think this regularity of sailings and rates is to the general advantage of the public at all? You think there may be trifling advantages, but not sufficient to counterbalance the corresponding disadvantages?—On the whole, regularity and stability are great advantages, if we do not pay too much for them.

1432. Is it not a fact that the Merchants' Association has been engaged in a long struggle with the steamship company in order to secure the most favourable rates of supply?—Yes, but one of our biggest merchants here is entirely opposed to the Merchants' Committee in London, and that is Mr. Jagger, who is still fighting, along with other non-signatories, in the interests of the country.

1433. Are you or are you not of opinion that regularity of service in sailing and delivery is of considerable advantage first of all to the merchants of the country, the importers, and secondly, to all his customers?—Yes, provided it is not obtained at too great a cost.

Mr. LUDWIG WIENER, called and examined.

(*For the evidence of this witness on "Railways, Harbours, &c.,"* see *p.* 104.)

1434. **(Chairman.)** I think you have been in a large way of business in Cape Town for a great number of years?—Yes.

1435. You gave evidence before a Select Committee on Railways and Harbours?—Yes.

1436. We have read the evidence given before that committee, and the Commission is anxious to learn your views on the subject, especially as to the position of Cape Town as a great seaport on the ocean route and its future development?—I have given information to the Government on several occasions on that subject, especially since the Panama Canal route came to the front as an additional competitor for ships rounding the Cape of Good Hope eastwards. I have always been one of those who strongly advocated the interests of Cape Town and the Cape of Good Hope route in competition with the Suez Canal route. When that route was opened we lost a great deal of shipping which used the world's highway of the Cape route. But when Natal was able to produce a good quality of coal at reasonable rates and when coal-mine owners woke up to the importance of selling that coal at moderate prices instead of trying to make a huge profit out of it, the price was brought down very considerably. That fact of reasonable railway rates to the coast from the mines has assisted us very much and has proved to be a strong inducement in attracting a large number of ships to take the Cape route, eastward bound. I am one of those who believe that we can still recover a good deal more of the traffic which at present goes through the Suez Canal and even show a good face against the Panama Canal. I am not speaking of the regular liners, which are bound to speed and time, but in respect to a number of ocean tramps which I find at the present time go eastward in ballast to a loading port. I think last year or the year before 1½ million tons of shipping passed through the Suez Canal in ballast, so it is only a matter of calculation with ships to take the Cape route where they can get cheap coal though the distance is longer; immense benefit would be reaped by this port if a considerable portion of that traffic were induced to take the world's highway round the Cape eastward. Next our regular mail steamers, the Union-Castle Company have for a number of years combined with other lines of steamers, forming a powerful ring, with deferred rebate system and made

us pay the highest rates of freight in the world, considering the advantages South Africa offers to ships engaged in this trade by cheap coal and low port charges and a fair weather passage from England.

1437. Can you give us figures to support that statement?—We are paying from 25*s.* to 45*s.* per ton. The rates vary at the different ports of the Union to the extent of four or five shillings a ton, but taking Cape Town as a standard the rates run from 25*s.* to 45*s.* according to the classification.

1438. That is to say, freights from here to London?—No, I mean from Europe to Cape Town. Of course, one of the reasons always given in the past for these excessive freight rates was that coal was expensive and that there was no return cargo. But now coal has come down to such a price that it is possible for ships to coal here with the best Natal coal at great saving. If we could induce the ships that go eastward *viâ* Suez Canal in ballast to take the Cape route, to go on the berth in London and take cargo at a reduced rate of freight, we would reap the full benefit of our geographical position, with cheap coal thrown in. Since the new mail contract things have in no way improved, for the mail company and the old Conference lines have formed a new combination and under threat of shutting out shippers' goods they forced a large majority of shippers to sign an agreement, by which they bound themselves only to ship per new combination steamers. In that way our hopes of an open freight market were frustrated, and further, under the new mail contract, all the the Government freight (about 250,000 tons) is pledged to the mail company for five years; this also greatly militates against an open freight market.

1439. What rate was that?—About 19*s.* right round, or something like that. I really believe that the Railway Administration, who are very large shippers, did use its influence to cut that period down to about five years as already stated, though the mail contract is for ten years. Why I mention it is this. If Government freights had not been fixed up we could use that as a lever to induce other vessels to lay on outside the mail boats, and by being able to offer cheap coal here for bunkering purposes and being able to discharge quickly at all the ports from Cape Town to Natal, many ocean tramps would have made use of this opportunity to our advantage. These ships, after discharging their cargo, could then load coals as cargo at Durban to eastern ports, selling the coals there and then loading cargoes for the homeward voyage *viâ* Suez. By that means the ocean tramp steamer would be earning all the way out from England and all the way back again. It stands to reason that under such circumstances the ships taking up this trade could offer freights very much less than are offered by the combination at the present time.

1440. (**Mr. Campbell.**) Your suggestion is that tramps should bring cargo out here, then ship Natal or Transvaal coal from here or Durban, say, to India or to some Eastern port, and then get a cargo home?—Yes. Very often they do it now. For instance, the Clan Lines do it. They get high freights out to this country, they take coals to Eastern ports and then they make the return voyage again *viâ* the Suez Canal. At the present time a combination of coal holders has been formed in the Transvaal, which ships largely from Delagoa Bay to the East, to supply the railways in India; this is done under a London contract covering something like a quarter of a million tons. They have by so doing considerably stopped competition for Indian trade in coal; the outside or open mines are not many.

1441. What does that combination do?—As I say, that combination has contracted with one large contractor in England, who has himself secured the contract for a large quantity of Transvaal coal for the Indian railways. He draws his supplies from this combination, and they cannot sell coal to anybody else. But there are still some companies who are outside of that combination.

1442. What ships do they send the coal by?—Ships that are discharging coal all the way from Cape Town to Delagoa Bay. And a number of ships from Australia and elsewhere, laden with timber, breadstuffs, &c. discharge their cargoes at Delagoa Bay and load coal eastward.

1443. Is there a large trade now being done in coal from Natal ports or Delagoa Bay to India?—Yes. Well, Natal is rather disappointing, I thought they would do more than they have been doing. I am speaking of cargo coal outside of bunker coal, though things have improved lately.

1444. Can you tell us what is the amount of Natal coal exported every year to India and Eastern ports?—I think it is about 150,000 cargo coal, and the total bunkering at all ports for 1912, 1,500,000 (about).

1445. What number of tramps do you get here?—We have very few. All the ships that call here, except those that come from Australia with timber or flour, mostly belong to the Conference lines and are in the combination.

1446. So that the free tramp hardly exists, I understand?—Yes, that is so at the present time, but we used to have quite a number of them.

1447. Since when has that trade gone out?—I think, perhaps, twenty-five years ago.

1448. Owing to what reason?—Owing to the combination. First there was the Union line and the Castle line. These two lines combined and then the Conference lines joined them.

1449. You said just now that freights to this port were higher than on any other trade route in the world?—Yes.

1450. Can you give a comparison to substantiate that?—Take the freights to the Argentine. Under the new contract we have a rate fixed by Sir Owen Philipps for the homeward freights on maize; it is now a fixed rate of 10*s.* a ton on maize, but on other articles, such as skins and hides, Buenos Ayres is an open market and their rates are often lower than ours. They have at times a rate of 7*s.* 6*d.* for maize, and half the rates that we pay for wool and skins. Freights from Australia are also lower considering the distance.

1451. How do the rates compare?—Australia is very much cheaper than ours, though our geographical position on the world's highway is an advantage to us, and at the same time we can offer cheaper coal than any other port in the world. Therefore we should have cheap outward freights, but that is not the case owing to the forced agreement with the Conference lines.

1452. You said just now that there is no open freight market here. What do you mean by that precisely?—They used to give rebates until the new contract came into force. Under the new contract, with the exception of a certain number of merchants, who have pluckily held out from signing an agreement, all others have bound themselves to support these lines absolutely for a given period, running from six months to twelve months, and to ship by no other vessels. That arrangement was entered into after the new mail contract came into force. Formerly there was a system of rebates, which was retained for eighteen months. The rebates varied from 5 to 10 per cent. on freight collected.

1453. Have you considered the question of making Cape Town a port of call on the Australian mail route?—I cannot say I have devoted a great deal of attention to that point. They want speed and regularity. Well, the Canal would give them that. On the other hand, you have a lovely fairway passage by this route from England. Then in future comes the Panama Canal. We have now steamers coming from New York and going to Australia *viâ* the Cape. Those, of course, we will lose when the Panama Canal is open.

1454. Well, there are possibilities of vessels going out to Australia *viâ* the Cape and home *viâ* the Panama Canal, and so going round the world perhaps that would make it level?—Yes.

1455. (**Sir Alfred Bateman.**) I think you said you had no tramp steamers?—Yes.

1456. And you rather wish you had them?—Well, we have been wanting them as soon as we are a free port for ships.

1457. But when the trade is brisk you lose the tramps—you cannot rely on them to do the business?—We cannot altogether rely on them. We may lose a number certainly, but I would take my chance. If freights go up we will have to pay, but when they go down, we get advantages which at present we do not get.

1458. You have a regular service now?—Yes, and very expensive too.

1459. It is perhaps a little higher, if anything, than seven years ago?—Yes, and in spite of getting coal here for about half the price ships formerly had to pay.

1460. Are you speaking of freights out or home?—Out. After all, the freight home is always given forth as a reason for freights out being high, because we have so many valuable articles of no bulk, like diamonds, gold, and feathers, which do not fill ships. If we can encourage tramps to come here, they can bring a cargo outward, and then take coals eastward to a loading port there.

1461. Why do they not go now?—For the last ten years all the freight was handled by the combination at a rebate of 10 per cent. The combine held this rebate terror over our heads, amounting from a 10*l.* note up to two or three thousand pounds and more.

1462. That is all gone now?—Yes. Rebates have been made illegal. But they have humbugged us in some other way.

1463. You have to sign a contract?—Yes.

1464. And if you do not sign you are in danger of being shut out?—Yes, they have tried to do it.

1465. In the olden days, did you stick on to the Houston Line as long as they were outside the ring. You remember they held out for some years?—Mr. Jagger had a contract with them, and went on with them at low freights even after they had come into the ring. He still had the low freights.

1466. Yes, the Houston Line was absorbed by the Conference lines on the understanding that the contracts which had been made would continue till they expired. Well, you did not back up your opinions? You came under the Conference lines?—Yes. Well, on a matter of that kind it is a question of whether shippers will stand together. You see some of them are strong and some are weak.

1467. With the rebates, you could not help yourself. Can you tell me anything as regards the South African Merchants' Committee in London; do you consider them representative of the trade here?—No, I do not, and I never did.

1468. Why?—I have in the past attended some of their meetings myself when I was in London, as a matter of courtesy, being asked by the Chamber of Commerce here as Chairman to do so. I reported that it seemed to me that the members were very sympathetic to the combines, and I did not think that our interests were sufficiently looked after in that respect.

1469. You thought they were too friendly with the lines?—Well, the word "sympathetic" is a very good term for it, I think. And speaking for the Cape Town and Associated Chambers of Commerce, I do not think they have many friends here.

1470. Why do you not have a proper combination of that kind? If the South African Merchants' Committee is not a good body, why do you not form another one, and then you would be in a better position to deal with the lines and make a bargain? I have been fighting to that end—we are trying to establish such a body here now, with Government assistance.

1471. You will then be in a strong position?—How can we, if the largest shippers—the Government—have tied themselves with all their freight hand and foot for five years to the Mail Company.

1472. In regard to their own shipments?—Yes, the Government would have been a factor in inducing the ship to lay on getting cheap freights for themselves and others. I will give you an illustration on a matter which I carried personally through some years ago. This will show you the disadvantage which we would have been placed under in regard to the difference in rates of freight charged by the combination when they have the power. The Harbour Board were building the very pier which we are now going to pull down. That was in 1890. I went to England and America. The engineer said that the piles would have to be imported in one piece as they could not be riveted here. They must come out whole, and they were 50 ft. in length, and in the estimate a certain rate of freight was provided for; if higher freight was charged it would increase the cost very largely. When I got to London, I went to Sir John Coode, our Consulting Engineer, and submitted the matter. I said: We will go to the Agent-General and get the Mail Steamship Company to quote the lowest rate. They asked us 210*s.* per ton measurement. This was very excessive. I went to our agents, Chalmers, Guthrie & Co., and said: Can you give me quotations for this freight? They went round in London, and found that even among the tramp steamers there was a difficulty in getting what I wanted. I then went to America, and when I got back our agents said there had been a quarrel among the shipping people, and a tramp company had come forward, offering three ships, provided we give them quick despatch to Cape Town and rate of freight of 45*s.* instead of 210*s.* We filled them with jetty material and other Harbour Board stuff at a saving of 8,000*l.* in freight.

1473. They were charging very high prices because you wanted special tackle?—If we had been then in the same unfortunate position as we are to-day, they could have insisted on the rate asked. I merely want to point out to you how exorbitant their charges are when they get a chance to put it on.

1474. **(Mr. Campbell.)** You spoke of a combination of mines in Natal, and of there being some mines outside of the combination?—Yes, in Natal, but they are of no consequence, and the quality of the coal is not good.

1475. Is there a combination of Transvaal mines as well as of Natal?—Yes.

1476. The combination you spoke of was the Natal combination?—Yes. It is the Transvaal combination which has a contract with a party in England, who in turn has a contract for a lot of coal for the Indian railways.

1477. In regard to these ships, we had evidence that no cargo is carried here from London or Australia except in the ships belonging to the Conference lines?—No, I do not know of any.

1478. Are there any?—No, I do not think so. Nearly all the ships that come here with South African cargo are in the combine.

1479. Are there any ships outside the liners with which the Government has an agreement?—Yes. The mail company run a number of steamers in addition to the mail steamers, called intermediate or extra steamers.

1480. Are there any other boats except those that carry cargo from England to here?—There is the Clan Line.

1481. Do they carry cargo from England to this port?—Yes, and there is the Houston Line, the Bucknall Line, and a number of others.

1482. Are there any boats outside the Conference lines?—Not from England, nor from America, nor from Hamburg.

1483. We had it in evidence in England that somewhere over 100 ships are leaving the port of Hull for South Africa. Do any of those carry cargo out here?—There is some mistake. I know the Hull people have approached us to divert some of the traffic away from London, and I said: Why do not you start an independent line in competition?

1484. None of these boats that come from Hull are independent?—No. I know of none coming to Union ports.

1485. The German boats trade round here?—Yes.

1486. They bring cargo only from Germany—they do not carry from England?—Yes; they are also in the ring as far as the rates of freight are concerned.

1487. How do the rates from Germany compare with those from England?—They are the same.

1488. They are in the combination too?—Yes. The only thing we have gained under the contract is that our homeward freights are not subject to restrictions as they were before.

1489. In what direction?—Well, before, you see, we got rebates and you could not ship by any ship you liked without consent. There is no consent required now. Before, the conditions were very peculiar. A ship used to call from Australia, discharge 1,000 tons of wheat, say, and you might have 1,000 tons of maize lying on the wharf here, or wool. By an agreement, they would not take our stuff, and if we did ship, of course we lose all the rebates due to the shipper.

1490. **(Chairman.)** But all that is put an end to? Yes.

1491. **(Mr. Campbell.)** These conference line rates are specially high as compared with any other principal trading place, but while that is so you get some benefits out of the conference, do you not? Free carriage of stock—cheap carriage of maize?—That is quite true. But I do not think there is so very much in it. First of all, there are a good many restrictions on these privileges.

1492. What is the quantity of maize exported, very large?—No. It was three years ago, but of late it has been smaller, because of the drought, which has been very bad in the Free State and in the Transvaal as well as Natal.

1493. It has been large but it is not now?—I think it is a very foolish business myself this shipping of maize to England and then importing it again in the form of bacon and hams and butter. It is not a very economical proposition. The Commission, perhaps, does not know that we were placed in this peculiar position. If a man in Cape Town wants to buy a ton of maize the price is the cost of this article plus 20*s.* railage, but if it is for export the railage is 10*s.* a ton. So that the man in England got his feed-stuffs with the freight added for the same as we paid here.

1494. And in spite of that there is not much exported?—No.

1495. **(Sir Rider Haggard.)** You spoke of having got rid of a rebate and then you added: "but they get us in another way," or words to that effect?—Yes, by this contract which we have to sign.

1496. What is the exact form of that special contract?—All those who did not sign would have their goods shut out—that was the threat—and a large number of merchants in London very much favoured the agreement, but a large number here refused to sign it.

1497. Do you really allege that people who refused to sign the agreement were threatened that their stuff would not be carried?—Yes, that is the point that is now being arbitrated upon.

1498. Do you mean to say that unless they agreed to sign some contract which was outside the ordinary arrangement they were told that the goods would not be carried?—Yes.

1499. And is that within the common law that any carriers who refuse to carry goods cannot be made to?—That is now under arbitration in London.

1500. **(Mr. Sinclair.)** In your opinion, South Africa is now suffering severely owing to this combination, making freights higher, in your opinion, than they ought to be. Can you tell us whether any rough calculation has ever been made as to what in a year the excess rates would come to?—Yes. Well, the cargo landed last year was nearly 3,000,000 tons. If you got 5*s.* a ton reduction that means 750,000*l.* But it is more than that with an open freight market.

1501. That would provide a substantial interest on the capital expenditure if it were decided to build boats of your own?—Yes.

1502. Do you favour the State intervening where it is to protect the community from high freights?—Yes. I have advocated the Government acquiring the coal mines also, so that they would not be entirely in the hands of private interests.

1503. Have you anything to say to the Commission about speed?—You are speaking of the mail steamers. Naturally, the world does not stand still. We are all anxious to get steamers here as quickly as possible, and I think there is a general feeling among the mercantile community that it should be possible to accelerate the mail service. But it is said that it means expense, and Parliament as constituted by us, which represents a large farming community and a considerable backveldt element, who are in no great hurry, did not like the increased cost.

1504. I wanted to find if you considered that the speed attained under the recent contract is adequate for the sum that is already paid?—That is rather a technical question. But, considering the advantages that the mail steamers get now as compared with a number of years ago, I do not think we have been favourably treated as regards speed.

1505. I understand you were getting as great speed twenty years ago as you are to-day?—Yes, nearly.

1506. **(Sir Jan Langerman.)** You said just now in effect that to meet the difficulties, the Government might intervene and build ships?—Yes.

1507. But should not that be left to private enterprise?—No.

1508. Why should the Government want to build?—I am a bit of a socialist myself. It is in the interests of the people of the country.

1509. But there is a time when the importers and shippers must help themselves—the Government cannot do everything?—But I say, if we can control the railways representing many millions I think we should be able to control a line of steamers—very much like the Canadian Pacific Railway. They do not want to do all the sea transport, but they want to control the rate of freight and thus fix the price—just to control it.

1510. You expressed some disappointment that the cargo coal shipment was not what it should be here?—Yes.

1511. Was it not due to the want of railway accommodation. No, I am speaking of Durban; I do not think so. I was on the Ports Inquiry Committee and had an opportunity of looking into the matter and I think the mercantile community at Durban themselves were at that time a little to blame in not pushing it enough.

1512. Because the complaint was that Natal said there were not enough railway lines, and the Government have undertaken to duplicate the line?—Yes, a portion of it. The controversy is still going on. Somebody wanted to have a mineral line built, which I certainly rather support in view of the future.

1513. Whatever line is adopted it is all with the view of increasing the output of coal at the port?—Yes.

1514. You hope to divert a lot of trade from the Suez Canal here?—Yes, and also from Panama.

1515. But if you take the distance through the Suez Canal into consideration compared with the Cape, is it possible then to induce ships to come here?—I should like to put in a report which I drew up for the Government, and which deals with the whole question.* It is possible first of all, I advocated, to free all our ports of ships' dues, as an advertisement. Ever since 1870, when the diamond fields were discovered our farmers have had golden years. In 1886 the discovery of goldfields has helped to maintain things. But the time will come when that will not hold good any more, looking ahead. I want to provision ships here. I want ships going eastward to call. I want to help the farming industry in providing a home market by provisioning ships with what they produce. Then another essential is cheap coal at Union ports.

1516. Is that possible in face of the combination?—No, it is not; that is why I advocated Government owned mail boats—not so much to carry all the freight, but to fix the rates of freight and control them.

1517. But could they fix the rates or have their own line while the contract is in existence?—No, but these proposals were made at the time of calling the tenders.

1518. It is now hung up for fifteen years?—No, ten.

1519. Is there not an option of five?—No, the freight contract is only for five, fortunately.

1520. If the Government want ships they should begin now?—Oh, no, I do not think it is necessary, seeing that they can build a Dreadnought in a couple of years.

1521. **(Chairman.)** Can you tell the Commission at what price bunker coal was sold in Cape Town at the

* Not reprinted.

"Scot" period in 1890?—No, there was none sold here then. It was all imported, and cost 35*s.* or 40*s.* a ton.

1522. As compared with 22*s.* or 26*s.* now?—Yes.

1523. Is that about the difference in the cost of bunkering?—Not for bunkering, but for the coal itself; cost of bunkering extra.

1524. What is the rate of freight from Natal to India on coal?—That varies. It may be 8*s.* to 10*s.* or more. Some of the ships buy the coal themselves and make what they can at the other end.

1525. Is that a large business—ships bringing goods out here and then taking coals out to India?—Yes. Some of the ships I mentioned of the conference lines—outside the mail boats and intermediate boats that go eastward—they are not allowed to take any freight homeward—they must go eastward or return to England in ballast.

1526. What lines are they?—The Clan, Bucknall, Houston, &c

1527. And they have a triangular tour?—Yes; and I want similar tours but with an open freight market. People are so afraid of fluctuations of freight, but it is such a small factor in comparison to the value of goods. Is there a single commodity that remains stationary from January to December? Why should freights be a fixture?

Mr. K. SPILHAUS, of Messrs. W. Spilhaus & Co., called and examined.

(*For the evidence of this witness on "Bills of Lading" and "Bunker Coal,"* see *pp.* 88 *and* 105.)

1528. **(Chairman.)** I understand that you are ready to give evidence on the question of Freights and Bills of Lading?—I am ready to help the Commission in regard to any questions that are asked.

1529. What is your view as to the present position of the freight market here and the conditions under which freights are established?—I am in favour of an open market, because there is still a working agreement between several of the principal lines trading to South Africa, which prevents merchants making use of outside tonnage.

1530. In other words it amounts to this, that you have to be a permanent client to be certain of getting the best treatment?—One has to be a contractor to get the most favoured treatment.

1531. And that, you think, is detrimental to trade?—I consider it is a disadvantage.

1532. How do you propose to remedy what you consider an unfortunate position of affairs?—Not by legislation.

1533. By what then?—In my opinion the only thing is for the Government to keep its freights open. If the Government did not contract for its freights it could give them to other lines and support outside tonnage whenever they considered it necessary to do so.

1534. The Government being tied to the combination for their freight takes away the necessary basis from any other plan?—Quite.

1535. What would you say respecting the general level of freights here compared with freights to and from similar countries?—That is a very difficult question to answer, because one has to take different conditions into consideration; for instance, there is the question of return freights and that sort of thing. On the whole I think we are on a higher level than any other country, although I should say that our trade might not be quite as constant as in other countries. I would only refer to the maize trade, which we all anticipated would be a great trade some years ago and which has not developed as we expected owing to the continuous bad seasons. That is a factor which shipping companies have to take into consideration when they arrange their rates and freights.

1536. Why do you consider that freights here remain at so high a level. Is it due entirely or mainly to the Government arrangements with the Conference lines?—I think that is chiefly responsible.

1537. **(Mr. Tatlow.)** Regarding the export of maize, to what do you ascribe the falling off?—To bad seasons.

1538. You are satisfied with the rate?—Yes.

1539. **(Sir Alfred Bateman.)** I think you gave evidence before the Shipping Rings Commission?—Yes.

1540. And you are still not quite satisfied?—We did expect a different committee from the one we have now. We expected a committee more or less in the nature of a Court of Appeal, but the committee which has been appointed is just simply a talking machine and of very little value. You will remember that I suggested that the dissatisfaction with the Conference lines was more on account of the then administration of the system than on the principle, and I thought a good deal of friction might be prevented and a good deal of dissatisfaction might be removed by the formation of a South African Committee of ship owners, merchants, and representatives of the Government to deal with any question that might arise.

1541. That was rather blessed by us in our report was it not?—It was blessed by the Commission, and the Government also gave them their blessing and the mine owners said it was a good thing. The Government have refused to appoint a representative, and the shipowners have refused to appoint a representative, and in any case they are not going to be bound by the representatives of the Committee.

1542. So you are still left with the South African Merchants' Committee in London?—Yes.

1543. But you have got rid of the deferred rebates?—Yes.

1544. I think you said that South Africa was rather badly treated in regard to rates. How do you compare with the Argentine, which is about an equal distance from England?—Of course, it is a very difficult thing to compare home freights, you have to look at the outward freights as well. There is a rate of 7*s.* 6*d.* on maize from the Argentine to the United Kingdom and when you bring that to the notice of anybody here he says at once that ours is a high rate. We pay 10*s.*, but at the some time the rate of coal to the Argentine is very likely 30*s.* a ton, so it counter-balances.

1545. And you do not think you are very badly treated in that respect?—Well I should prefer an absoluteiy free hand, so that matters would right themselves; at the same time I should not like to say that we are badly treated.

1546. Although you get stability in freights, the possibility of getting freights homeward in bulk at a lower rate might have something to do with the freight charge and a great proportion of your exports are of very small bulk?—Yes.

1547. Now the converse would be the case in the Argentine?—Yes, they have more plentiful homeward cargo.

1548. Has that anything to do with it?—I am quite sure it has.

1549. Both the outward and homeward freights?—Yes.

Cape Town, 5 and 6 March; East London, 16 March 1914.] Senator the Hon. MARSHALL CAMPBELL, Mr. W. W. HOY, Mr. C. H. BOCK, Jnr. [*Communications: Post, Telegraph, and Steamship (including Freights).*

Cape Town, Thursday, 5th March 1914.

Senator the Hon. MARSHALL CAMPBELL, called and examined.

(*For the evidence of this witness on the "Sugar Industry" and "Forests,"* see *pp.* 183 *and* 289.)

The witness made the following statement:—

On the subject of the evidence which was given before the Commission the other day in regard to the Union Government building its own mail steamers, I would like to say that I object to the Union Government doing any such thing. I have been a shareholder in these Conference lines for many years, although I am not a shareholder to-day. I think it would be a very serious mistake for the Union Government to do this.

1550. **(Chairman.)** You think that the Government service would be expensive and badly run, I presume?—Yes. It is impossible for a Government to run an industry of that description efficiently.

1551. Are you interested in maintaining cheap freights?—I am not interested in any line of steamships at all, but I believe in the rebate system—it keeps the market steady. In the olden days I have known freight to be sometimes as low as 7*s.* 6*d.* a ton, and the following month to be 50*s.* a ton.

1552. Then you prefer stability to cheapness?—Yes.

Cape Town, Friday, 6th March 1914.

Mr. WILLIAM WILSON HOY, General Manager of Railways and Harbours for the Union of South Africa, called and examined.

(*For evidence of this witness on "Railways,"* see *p.* 107.)

1553. **(Chairman.)** Have you any figures to show what proportion of Australian trade does come and did come *viâ* Cape Town?—No, but the number of calls in connection with the Australian trade is greater now than it was.

1554. Can you give us any detailed comparative figures?—Yes.

1555. I want to know the amount of shipping; what proportion that represents to the total: whether the absolute amount is increasing, and the proportional amount, both ways. Of course, the figures in each direction will be different?—Yes, you want figures in regard to the interchange of traffic between South Africa and Australia.

1556. No, I mean between England and Australia for ships calling here. In other words, it is your position in regard to the competition of the Suez Canal. I ask the question because it is conceivable that the proportion is largely dependent on the cost at which you can bunker here?—Yes, and, of course, with the larger vessel the probability seems to point to its coming this way instead of going through the Canal.*

* For information subsequently supplied by witness, *see* App. III., p. 85.

East London, Monday, 16th March 1914.

Mr. Carl Heinrick BOCK, Jnr., Wool Buyer, called and examined.

(*For the evidence of this witness on "Animal and Agricultural Produce,"* see *p.* 207).

1557. **(Mr. Campbell.)** Have you any complaint to make about the freights from South Africa home?—As far as the present state of affairs remains while we have stability of freights we are quite satisfied. But with the abolition of rebates there is, of course, always the possibility that a steamer may come in and set up a fighting rate, and that will upset the whole trade.

1558. You are quite satisfied with the present conditions?—Yes, as long as they remain.

Kimberley, Wednesday, 18th March 1914.

Mr. JOHN ORR, Deputy Mayor of Kimberley, and Member of the Kimberley Chamber of Commerce, called and examined.

(*For evidence of this witness on "General Trade Questions,"* see *p.* 156 *of* [*Cd.* 7707.])

1559. **(Chairman.)** You represent the Chamber of Commerce?—No, but I am a member.

1560. Do you speak for yourself?—Principally for myself.

1561. I think the first subject you desire to speak upon is that of cables between South Africa and the rest of the world?—Mr. Chairman, I have really no notes on this particular subject further than to say, that this matter has been discussed in the local Chamber of Commerce and it was felt that it was desirable, in the interests of the commercial community mainly, that a lower minimum should be placed on the week-end cables than we have at the present time.

1562. What do you suggest it should be reduced to?—At present the minimum is 15*s.*

1563. Do you suggest, or propose, to reduce the minimum number of words to 15 or 10?—I should say 15 or 20—15 would be preferable, I think, we can always work from the minimum upwards.

1564. Do you also attach any importance to the transmission of these cables by telegraph throughout instead of the present system under which they are delivered at the far end by post unless special instructions are given to the contrary?—Speaking for myself, I send a cable on Saturday night and it gets delivered in London on the Tuesday morning, I understand, through the post.

1565. Do you advocate delivery on Monday morning instead of Tuesday?—I do not think there is really any great advantage in that.

1566. Then you urge the reduction from the minimum from 30 to a lesser number?—Yes.

1567. Have you any suggestions to make with reference to deferred cables, that is cables at half rates?—No, I do not think so, except that we are bound down somewhat hardly in not being allowed to use certain terms in these cables which are considered as code words; for instance, they will not allow us to send the letter "T" or any other letter.

1568. It must be a known word?—Yes.

1569. They will not allow you to send figures either, I understand?—They will let you send them as words, you have to put them in full.

1570. Do you urge that figures should be permitted if they make sense with the rest of the message?—I should think that would be of great advantage in the same way as with ordinary inland telegrams.

1571. That is to say, you advocate the use of figures in deferred messages provided there are reasonable precautions against it being code?—Yes.

1572. With reference to these cables, is there any other point you wish to bring forward?—I do not think so; there is no other question except that, of course, the Cable Companies might see their way to reduce the ordinary charge for code messages from 2*s*. 6*d*. to a lower rate.

1573. You cannot have everything at once, and not being able to do both what do you suggest as the most urgent?—I should think what I mentioned at first, namely, a lower minimum for week-end cables. Of course, in regard to ordinary cables, most people use code language.

1574. Having to choose between one reduction and another you consider the most urgent is the reduction of the minimum number of words on the week-end cable, and certain alterations with reference to the deferred cables?—Yes, that is so.

1575. **(Sir Rider Haggard.)** Supposing you get your week-end cables lowered in price, do you think there is a large public which will take advantage of it?—I think so; I am speaking now, of course, not only for myself. I take it that any change which took place would apply to the whole of South Africa. I know that there are other firms who avail themselves largely of those week-end cables, and sometimes in my own experience I find it is difficult to work up enough words to send my full value.

1576. You are speaking of sending commercial cables?—Yes, principally.

1577. Not social cables?—No. I have no experience of that: the postal authorities would, of course, be able to give information on that point.

1578. Do you think that if the number of words or the price of these week-end cables was reduced, the commercial community would avail itself of that?—That is the feeling when conversing with other people on the subject.

1579. But it was probably more to meet the social requirements of the community that the Cable Companies introduced these facilities?—I do not know, but I can say that they are very largely used here by commercial firms—more largely than by private individuals.

1580. But my point is, was that the design of the Cable Company in introducing them, was it not rather that they might be of service to private individuals in a social direction?—No doubt they had that in view, but I think that they are more largely used by commercial houses.

1581. And do you think that you can fairly ask the Cable Companies to give you further reductions on those cables for the convenience of commercial houses, who, as a general rule, can well afford to pay higher rates. I submit that for your consideration?—Yes.

1582. **(Mr. Campbell.)** Does not the ordinary commercial man use code?—Yes, but even in commercial businesses you cannot include everything you desire in a private code. I am speaking now of my own line of business.

1583. On the general average it would be very much cheaper to code messages than use any form of deferred messages, would it not? Speaking from my own experience I use both.

1584. And you found that the deferred cable message pays you as a business proposition against the code?—The deferred cables are used very little. It is either the code or the week-end.

1585. On what ground would you base the assumption that they would be largely availed of by commercial people if they were cheapened?—In this way, I think that certain messages would be sent that perhaps are not sent to-day, because at the price of 15*s*., people say it is not worth it. If the price were 7*s*. 6*d*. or 10*s*., they might make use of it.

1586. As a matter of fact is not the South African Government already paying a certain sum per annum on the loss which is made on the Eastern Telegraph Company's business?—I am not in a position to say.

1587. Suppose you knew that that was a fact, would it make any difference?—Of course, I should not have such a strong argument, but I am only speaking from a commercial point of view when I say this would be an advantage.

1588. And you think it would be extensively used by commercial people, more so than by private users?—I am not speaking so much of the deferred cable as the week-end cable.

1589. **(Mr. Sinclair.)** Do you use all three systems of cabling for the purposes of your own business, that is the code, the deferred, and the week-end?—Speaking for myself, I only use the week-end and the ordinary code cable.

1590. Do not you find that the deferred cable is really at a disadvantage as against the code message, having regard to the disabilities that it is under?—Yes, I think it is.

1591. If you wanted to send a deferred cable with the letters f.o.b. or c.i.f., which have a well-known meaning, have you not to pay for those letters as three words each under the deferred system?—Yes, I think so.

1592. Do not you think that it would be an advantage if a week-end cable sent to you from England could be telegraphed on its arrival in the Union?—Yes, certainly. I usually send my week-end cables on Saturday night, and I have to pay 1*d*. per word for transmitting them over the Union wires.

1593. Do the week-end cables as they exist at the present time come into competition with the deferred?—I think they do.

1594. You told us that you used the week-end cable for your business purposes?—Yes.

1595. That was not originally intended, was it; the intention I suggest was that the deferred cable should be used for business purposes and the week-end cable for social purposes?—Yes.

1596. It has drifted into the use of the week-end cable for business purposes?—Yes, I take it that is so. In regard to the deferred cables, of course, you can send so little, they cost just half the price of the others, you can only use them for very very short messages. I should say they would be used more largely by private individuals, that is deferred.

1597. By those people who do not have a code?—Yes.

1598. **(Chairman.)** You say that these week-end telegrams are used considerably for business?—Yes, I believe they are largely used here.

1599. Is it new traffic, that is, if the week-end facility did not exist, would these cables be sent at the full rate or would they not be sent at all?—I think in a good many cases they would not be sent at all, or possibly, if they had not the week-end cable the ordinary cable might be used to a certain extent, but I think only to a limited extent.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. G. SMETHAM, Secretary of the Bloemfontein Chamber of Commerce, called and examined.

1600. **(Chairman.)** I believe you are Secretary of the Bloemfontein Chamber of Commerce?—Yes.

1601. You appear to give evidence on the subject of week-end cables and other improvements of the Cable service?—Yes.

1602. Will you kindly tell the Commission what your views are?—It is only a small item. The position, as far as we are concerned, is that the present minimum seems to be too high, and it is the opinion of the Chamber, and, I think, of the public generally, that if the minimum could be reduced it would be of very material assistance in regard to inter-communication between the Mother Country and South Africa, both privately and for business; there are many matters which I think the general community would take advantage of if such a benefit could be afforded.

1603. With regard to social cablegrams, do you consider that the reduction or the abolition of the minimum would create a good deal of new traffic?—Yes, and I think the postal authorities are very much of the same opinion.

1604. Now, turning to business telegrams, do you think that this facility which you desire would lead to a considerable increase of genuine new business?—Yes.

1605. By new business I mean not a diversion of telegrams which are now sent at the full rates?—Yes, the cables would be used for matters which at present are not cabled.

1606. And you speak as having considered the question and discussed it with other members of the Chamber?—Yes, that seems to be the general feeling.

1607. **(Mr. Sinclair.)** Did I understand you this morning, when you were talking these matters over with us, to suggest that there should be no alteration in the number of words that could be sent in a week-end cable?—I suppose there would have to be an alteration, but it would be a low limit. What I intended to state was that it would be better that there should be a low limit and a high rate per word than that the high limit should be continued at the lower rate. At present I believe it is 15*s.* for 30 words and 6*d.* per word for every additional word, or rather, 2*s.* 6*d.* for every five words. Well, if the limit was reduced, I think one way of meeting it might be that the rate for each word should be put up from 6*d.* to 9*d.* But the best basis would, of course, be to have the limit reduced if it could be arranged.

1608. Do you think you would be bringing them into competition with deferred messages, both being used for business purposes?—I would not like to say; I understand deferred messages are those sent at night time.

1609. The deferred messages are those sent at a a reduced rate?—I do not think they would compete with each other; where it was necessary to go into details in order to save time and to expedite business, I think the week-end cable would be used for the purpose.

1610. **(Mr. Tatlow.)** Has your Chamber of Commerce ever passed any resolution on the subject?—They have never passed any formal resolution.

1611. Is it a matter that has been engaging public attention in the town in a definite direction?—I would not like to say that, except in so far as it is a matter that has been discussed privately.

1612. Is it not often the best way to move in a public manner in order to bring these things to a point?—I do not suppose the community, as a community, have thought it of sufficient importance to move specially in the matter, but the sentiment has been expressed.

1613. Has it been taken up as a newspaper matter?—I have never seen it, but it may have been.

1614. Your own personal opinion in regard to this reduction inclines more to maintaining the present rate per word and reducing the minimum as much as it can be reduced?—I should think that would be the most desirable way.

1615. That would be better than raising the rate per word?—Yes.

1616. **(Sir Jan Langerman.)** What is your opinion of ordinary code telegrams at 2*s.* 6*d.* a word; do you think that rate should be reduced?—I suppose it is one of those matters which the commercial community would heartily welcome if it could be done, but they think the present rate, so far as it goes, is reasonable.

1617. They are satisfied with that rate?—Yes; of course, I suppose we are all anxious to get as much as possible.

1618. I understand you to say you would be in favour of the higher rate for week-end cables—that is, fewer words and a higher rate?—No, I did not say that I would be in favour of a higher rate. That would be the alternative; if they said they could not reduce the minimum without some corresponding benefit, then I would suggest that the rates should be put up and the minimum be made lower. But if, on the other hand, it was possible to reduce the minimum and retain the rate of 6*d.*, that would be most desirable.

1619. At the present time you have to pay 15*s.*, whether you use 30 words or not?—That is so.

1620. You prefer rather to have a sliding scale?—It is most essential that the minimum should be reduced to a minimum of words.

1621. And the corresponding rate as well?—Yes, but, of course, if you could retain the rate, so much the better; at all events, the lower minimum and the higher rate per word would, I think, meet the case so far as the public is concerned.

1622. And you think there would be increased business?—Undoubtedly.

1623. And there would be less labour on the part of the Cable Companies for the same amount of money because you reduce the number of words?—Yes, it would be *pro rata* as far as that was concerned.

1624. So that altogether there would be less labour for the Cable Company and they would probably get a higher rate for the same amount of work. They would have increased business, and besides being beneficial to the community, you think it would also be in the interests of the Cable Company?—Yes, I think so; if you can argue that the present rates pay the Cable Companies, then they would get increased business, which would mean increased profit.

1625. **(Mr. Bowring.)** Do you think the Cable Companies could handle the extra business they would receive on account of the reduction?—I gather they could. I cannot definitely speak on behalf of Cable Companies.

1626. So far as you know, they are not working at a maximum?—That is so.

1627. **(Sir Rider Haggard.)** Do you think the public are sufficiently well informed as to these facilities which are already given for week-end telegrams?—I would not say the general public, but the commercial public are.

1628. You do not think the general public are familiar with these conditions or facilities?—I should say they are more or less ignorant of these conditions; they are not advertised in the ordinary sense; you can get information in the Postal Guide, but unless you

study it you are not brought into contact with these conditions.

1629. The proportion of people who read Postal Guides is very small?—Yes, and it is not so large in this country as in England.

1630. So it becomes a close business; it is only known to those people engaged in commercial affairs?—Presumably so.

1631. **(Mr. Campbell.)** If it were a fact that any further reduction granted in connection with cable messages was to be at the expense of the general taxpayer, would you be in favour of imposing that burden on the taxpayer for the sake of granting further reductions?—Speaking entirely personally, I should say: No, not if it is going to entail a loss to the Cable Companies or the Government.

1632. You may be aware that at the present time the South African Government guarantees to the Eastern Telegraph Company a certain revenue every year, and they are at present paying some thousands of pounds to make up the deficiency on this guaranteed amount?—I believe so.

1633. You would not be in favour of granting further reductions if those reductions tended to increase the payments by the Government?—I do not think so; I am speaking personally.

1634. **(Chairman.)** You said the commercial public are acquainted with the week-end cable facilities, but the ordinary outside public is not?—I would infer so, as far as I am able to judge.

1635. But surely from the point of view of the Cable Company it is most desirable to bring these facilities to the notice of the outside public, all of whose traffic would be new created. That would be more important than bringing it to the notice of the commercial public, who might simply divert their messages from the full-paid rate?—Yes.

1636. So that in reality under the present state of affairs the least desirable portion of the public, speaking from the cable point of view, is the only portion that knows of these advantages?—Yes. Of course, the commercial community have also the facilities of their own codes, which is a big point.

1637. The commercial public might conceivably divert their business from the higher rate to the lower one; whereas the ordinary public, who do not telegraph at all, cannot divert?—That is so.

1638. Therefore, everything which you get from the ordinary public is a gain?—Yes. My next point is in regard to the prompt delivery of cablegrams.

1639. You want them delivered by telegraph right throughout without any extra fee?—Yes, so that a a cable sent off on Saturday would be delivered on Monday instead of Tuesday.

1640. Do you consider that important?—Yes, I have heard that point discussed, and it is a complaint made against the system as it exists at present.

1641. Can you tell me when week-end telegrams arrive here now?—They reach here on Tuesday morning. The same advantages are given in England as apply here. If a special fee for local delivery is not paid it means two days' extra delay, or delivery on Thursday.

1642. Are there any other points?—No.

NATAL.

Durban, Monday, 23rd March 1914.

Mr. ALEXANDER BUCHANAN, Chairman, Mr. WALTER BUTCHER, Vice-Chairman, of the Durban Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Statistics, Weights, and Measures," see p.* 127, *and on "General Trade Questions," see p.* 162 *and App. I. and II., pp.* 175 *and* 176, *of* [*Cd.* 7707].)

1643. **(Chairman.)** I understand you are Chairman of the Durban Chamber of Commerce, Mr. Buchanan?—Yes.

1644. And you, Mr. Butcher, are Vice-Chairman?—Yes.

1645. Will you give evidence together. We had better take the points one by one. First of all in regard to ocean freights, you have given us a memorandum on that subject.

The memorandum was as follows:—

OCEAN FREIGHT RATES.

The Durban Chamber of Commerce wishes to direct attention to considerations why the rates of freight from Europe to Durban should be lower than they are, and perhaps as low as or lower than the rates to Capetown and Port Elizabeth.

The rates of freight to Capetown and Port Elizabeth quoted by the Conference Lines are ex-ship, while those to Durban include landing and placing in railway truck or wharf shed. Allowing 2*s.* 3*d.* per ton as the cost at Durban of landing and placing in truck or shed, the rates of freight from Europe to Durban are about 12 per cent. higher than those from Europe to Port Elizabeth.

The distances from Europe and North America to Durban are about 6 per cent. greater than those from Europe to Port Elizabeth. A boat which occupies 25 days in the passage from London to Port Elizabeth occupies 26½ days in that from London to Durban.

This difference in the rates to Durban and Port Elizabeth has been maintained practically unchanged since the year 1894. The Committee of the Chamber think that since 1894 the conditions at Durban Harbour have altered to such an extent in favour of visiting ships as to call for a readjustment of rates of freight in favour of this port.

In 1894 the average depth of the Durban bar at low water was 12 feet, and that depth could not be depended upon. Of the 401 steamers which came to Durban that year 92 remained at the outer anchorage and 28 either lightened there or waited for spring tides.

In 1913 the average depth of water where was formerly the bar was 34 feet 8 inches, and but for one day's delay in March, caused by exceptionally heavy seas, there was no interruption to the navigation of the port.

In 1894 the cost of coal bunkered at the outer anchorage was 25*s.* and 28*s.* per ton (in fact no trade in bunkering at the outer anchorage was done); the present cost on board at the wharf of best coal trimmed into bunkers is 17*s.* to 18*s.* 3*d.*

In 1894 the cost of water delivered at the outer anchorage was 52*s.* per thousand gallons, and at the inner harbour 17*s.*; now the cost is 7*s.* 6*d.* per thousand gallons, with discounts up to 15 per cent.

The Chamber think it significant that in the case of sugar carried by steamers of the Conference Lines from Mauritius to South African ports, in which case the port of Durban is reached before the port of Port Elizabeth, the rate of freight to Durban is 19*s.* 6*d.* including landing, that is 17*s.* 3*d.* ex-ship, while to Port Elizabeth it is 17*s.* ex-ship.

The cost of best coal trimmed into bunkers at Capetown is 25*s.* to 26*s.* At Port Elizabeth and East London there are but limited supplies at high cost.

Durban, 23 March 1914.] Mr. ALEX. BUCHANAN and Mr. WALTER BUTCHER. [*Communications: Post, Telegraph, and Steamship (including Freights).*

The following are recent examples of dispatch in discharging loading and coaling at this port:—

Discharging: the "Grantully Castle" discharged 2,750 tons in 40 hours; the "Briton," 1,018 tons in 9 hours.

Loading: the "Intombi" loaded 1,588 tons of general cargo in 16 hours; the "Windhuk," 1,060 tons in 11 hours.

Coaling: the "Susquehanna" shipped 5,700 tons of coal in 17¾ hours; the "Kratos," 910 tons in 3 hours.

All landing, shipping and coaling at Durban is done by private enterprise.

1646. **(Chairman.)** As regards the comparison between the rates to this port and to other ports in South Africa I do not think we are competent to deal with the question. That is a question of local rivalry which you must settle locally, but the Commission is much interested in the facts as to the development of Durban Harbour. I propose to ask you a few questions on that. You state that in 1913 the average depth of water at the bar was 34·8. Is that low tide?—Yes, spring tide.

1647. What is your rise and fall?—From 6 to 7 feet.

1648. That brings you to 40 feet at high tide?—Yes.

1649. Can that be increased still further if necessary?—Yes, by dredging.

1650. And that is the minimum depth in the entrance at any point?—Well, in the channel. **(Mr. Butcher.)** It is hardly at any point. It is more correct to say that is available depth right through the channel.

1651. You say in regard to the "Susquehanna" she shipped 5,700 tons of coal in 17¾ hours?—**(Mr. Buchanan).** That is cargo coal.

1652. Shipped in what way?—By the coaling appliances at the coaling wharf.

1653. I suppose the other witnesses from the Harbour are going to state what the plans are for increasing the capacity of the Harbour?—Yes, they will have the plans to-morrow.

1654. Can you tell us generally what your trade is with India, and what the probable development is?—It is principally an import trade in gunnies and rice.

1655. Is that increasing?—Yes. I should think so. **(Mr. Butcher.)** As regards gunnies it is increasing, but as regards rice it is decreasing, on account of the cessation of the introduction of indentured Indian immigrants.

1656. Do you mean the diminution in the Indian population?—The immigration of Indians to South Africa has come to an end; consequently the demand for rice, which forms their principal food, has also diminished.

1657. Is rice consumed mainly by the Indians and not by the other portion of the population?—The proportion of rice consumed by white people is very small.

1658. Ships that bring these goods from India go back with what freight?—Coal principally.

1659. For what ports?—Different ports, Bombay principally and also Karachi.

1660. What is the prevailing rate of freight on coal from this port to India?—I am not able to say. Mr. Williams, the coal expert, will give evidence on this subject this afternoon.

1661. **(Sir Jan Langerman.)** Comparing the cost of bunkering, I see you are considerably less than Cape Town?—**(Mr. Buchanan.)** Yes.

1662. In regard to ships going from Australia to London and London to Australia is it a shorter distance to call at Cape Town or Durban?—It is shorter to call at Cape Town.

1663. Would it not pay them to bunker at Cape Town rather than here in spite of the difference in the cost?—It is a question of whether the saving in the coal would be equal to the saving on the extra distance which they would have to go out of their way; that is a question for the shipowners to decide.

1664. You cannot say?—No.

1665. In regard to sugar, I see from the Chamber's Report a reference is made to the carrying of sugar from Mauritius to South African ports. What is the sugar production of the Union?—Last year it was 95,000 tons.

1666. What is the local consumption, do you know?—It is all consumed in the Union.

1667. Is there enough to supply the wants of the Union?—Mauritius sugar is imported at certain seasons of the year, especially by the Cape Colony.

1668. Does the Natal sugar industry supply the wants of the Union right through the year?—It does, more or less, but Cape Town has had to import sugar, and also Johannesburg.

1669. But if you produce here more than you consume why do you import from Mauritius?—We do not produce sufficient at present. This year we expected to produce 110,000 tons, but they only produced 90,000 tons. The production is increasing from year to year, but we are not able to supply the entire wants of the Union.

1670. Is that the reason why you import from Mauritius?—Yes. **(Mr. Butcher.)** We do not produce the whole consumption for the Union of South Africa and the trade that is done with Mauritius is in a certain class of sugar which we are not able to produce in sufficient quantities at present.

1671. **(Mr. Lorimer.)** What is the reason given by the Conference Lines for charging a lower rate on sugar to Port Elizabeth than for Durban. What reason do they give?—They give no reason at all.

1672. I have had special opportunities of knowing that Durban people have spent enormous sums in dredging the port?—Yes.

1673. Year by year they have had a very fine fleet of dredgers?—Yes.

1674. And they are required to keep the port open?—Yes.

1675. Does the bar silt up quickly?—Not now. The days of trouble with the bar are past.

1676. And you naturally claim that having done so much to make the port accessible you should be reasonably and fairly considered?—Yes.

1677. And what is the reason for refusing that?—No reason is given.

1678. **(Sir Alfred Bateman.)** The freight rates are rather more now than seven years ago when I was here?—Yes, some of them have increased.

1678A. Eighty per cent. of the import rates?—Yes.

1679. 80 per cent. have increased?—Yes. You see, under the new arrangement with the Union-Castle Company they had the power to increase a great number. We could give you the information in exact figures if you wish.*

1680. Yes, you might do so. As regards exports they are very much the same, are they not?—No, we are exporting more wool and wattle bark.

1681. But the mealie rate was decreased to 10*s.* seven years ago?—Yes.

* *The following statement was supplied subsequently:—*

Extract from Report of the Committee of the Durban Chamber of Commerce, dated 8th August 1913.

Rates of Freight from Europe to South Africa.

The following information regarding the new tariff of rates of freight by the Conference Lines from the United Kingdom and Continent to South African ports is taken from a statement prepared by the Secretary of the S.A. Merchants' Committee in London:—

Total number of rates	1,049
Open or Special rates	19
Rates increased to full limit of 15 per cent.	812
Of these, 259 are increased from 42*s.* 6*d.* to 47*s.* 6*d.*, and 282 from 30*s.* to 35*s.*	
Rates increased but not to full limit	102
Rates reduced	36
Of these, nine are reduced by 5*s.*, and 19 by 2*s.* 6*d.*	
Rates unchanged	80
Total	1,049

1682. And that continues, I understand?—Yes.

1683. Can you tell the Commission whether the through trade with Australia is increasing from Europe. Do vessels come here at all?—Yes, on the way home particularly.

1684. Do they come to bunker?—They come to discharge cargo and to bunker.

1685. Is that increasing?—Yes, I think it is.

1686. But in the outward direction there is not much trade?—No, they usually call at Cape Town.

Durban, Wednesday, 25th March 1914.

Mr. Alexander Harvey Rennie, Shipowner and Shipping Agent, called and examined.

(*For evidence of this witness on "Harbours, &c.," see p.* 135.)

1687. **(Sir Alfred Bateman.)** I understand that you wish to put forward certain views in regard to week-end cables? You were speaking to the Chairman about it?—Yes. He was asking me as to the question of supplementary mails by fast steamers, and I told him that we look upon the mail now as merely confirmatory of the cables. The week-end cables take the place of the post and are of the greatest possible benefit to the public, and are made a great deal of use of.

1688. Are they used for business purposes?—Not only for business purposes, but for private purposes very largely.

1689. Are they taking the place of correspondence?—Yes, to a great extent.

1690. For private purposes?—Yes, as well as for business purposes.

1691. Code messages are not allowed?—No, and the minimum is 15*s.* for 30 words.

1692 I suppose you have no figures as to the amount of business?—No: but the Cable Companies could give you figures.

1693. Anyhow, in the six months there has been a large business built up?—Yes, a very great business.

1694. Do you think that has taken the place of the ordinary code message?—To a very great extent.

1695. Then has the Cable Company gained by it?—I think they have gained by the very great increase in the number of messages. You see, they first introduced the deferred cablegram, then the week-end cablegram, and it has really been astonishing the use that has been made of these fresh means of communication. People cable to their wives and families and friends about all sort of things which they would never have dreamed of cabling about before.

1696. How much is the deferred rate?—Half the ordinary rate of 2*s.* 6*d.* I think they could make the minimum of the other, say, 10 words for 5*s.* Then it would be made still greater use of. In the old days the mail conveyed all the news, but nowadays we do not pay much attention to the mail, because it is simply a confirmation of messages that have already passed by cable, especially in regard to merchants here; they order very largely by cable now.

1697. Do you think the cabling here is very considerable compared with the population?—Extraordinary. I think if you had statistics in regard to the messages sent you would be surprised.

1698. **(Mr. Sinclair.)** Then the week-end cable is now becoming an important part of every business man's operations?—Yes, a very important part.

1699. Largely taking the place of letters that were formerly sent?—Yes, we bottle up all our news, so to speak, till the week-end, and then send a long cable.

1700. Then compared to the deferred system, has the week-end cable resulted in messages being sent that were not sent before?—Undoubtedly.

1701. That is new cabling entirely?—Yes.

1702. Suppose the reduction were made that you advocate, would it provide new business, or would it be simply the cabling that goes on now at a reduced rate?—I think it would provide still further business.

1703. **(Sir Alfred Bateman.)** You do not propose a reduced rate, but you want to reduce the minimum of words?—Yes; it is 15*s.* now, whether you send 6 words or 30. I really divide the cabling now into three classes: very important, where we cable immediately; important, where we use the night cable; and ordinary, where we use the week-end.

1704. Taking the place of what previously went by letter?—Yes.

1705. **(Mr. Tatlow.)** Has the community of Durban made any attempt yet to obtain that reduction?—There has been no application to the Cable Companies that I know of.

1706. Is it a question that has engaged public attention at all?—It is gradually growing. The public are only now really becoming alive to the facilities that exist in the week-end cables.

1707. Is it a matter that has been discussed by the community and a desire expressed for it?—Yes.

1708. Is it a felt want?—Yes. Being a shipping agent, I find it so much with passengers who cable to their friends. We often get 15 or 20 messages handed in. They are just beginning to know of it.

Pietermaritzburg, Friday, 27th March 1914.

Mr. David Forbes Forsyth, B.A., Chairman, and Mr. Robert Dunlop, Secretary, of the Pietermaritzburg Chamber of Commerce, called and examined.

(*For the evidence of these witnesses on "Mining," and on "General Trade Questions" see pp.* 26 *and* 171 *of* [*Cd.* 7707].)

1709. **(Sir Alfred Bateman.)** There were two subjects which we had a great deal of evidence on in Australia, one was in regard to deferred cablegrams. Has any use been made of the change in regard to week-end cablegrams?—**(Mr. Dunlop.)** Business people use it rather extensively, but we are not a large public, and I do not think the facilities have received sufficient publicity. That has prevented them being used as much as they might have been, and then, besides that, some people do not like having to pay for the service instructions.

1710. Is not the minimum 15*s.* for 30 words?—Yes.

1711. Do you want that minimum reduced?—It is very desirable that we should have it reduced. If it was reduced the general public might use the cable a great deal more than they do. The use of it to-day is practically confined to business people. 30 words is rather a large number. Some people would only use eight words but they have still to pay 15*s.*

1712. Coding is not allowed?—No.

1713. It can only be written in plain language, and you would like it reduced to say 5*s.* for 10 words?—Yes.

1714. Are those facilities well known?—Among business men, yes.

1715. To that extent has it taken the place of code cabling, or is it new business?—I think it is new business.

1716. Another point was about the steamship communication; are you satisfied with that?—We are not satisfied with the rates.

1717. I was here seven years ago, and the rates are a little higher now than then?—Yes; and they are going up, I think. That is the tendency.

1718. But you are satisfied with the service? Yes.

1719. **(Mr. Campbell.)** In regard to week-end cables; of course, you understand that at present the Union Government is paying a subsidy towards the Eastern Extension Telegraph Company's service, and at the same time it is paying a very fair postal subsidy?—Yes.

1720. Now, as an alternative between a slower postal service and a very much improved and efficient cable service, which would be the better for the commercial community of South Africa?—I should say the more rapid postal service.

1721. You think that would suit commercial needs better than a more efficient cable service?—Yes, because a cheaper and improved cable service would affect a smaller class. The large and important firms, and the Rand Mining houses, and people of that kind would use the cables more, wanting to have information and communication direct with the centre of the universe in London, but the smaller commercial houses would value more a more expeditious postal service.

1722. Do you not think that those who were in a hurry to transact business would value a very much cheaper cable service, and use the cable?—Yes, but those people are small in proportion to the great number from whom you are going to withdraw the privilege of a swift and efficient postal service.

1723. That appears to be the point as to whether, to the very large number of people who use the postal service to-day, speed is a very great necessity. To the general community, is a matter of a day or two in the delivery of its ordinary letters a matter of great moment?—I think the commercial community in South Africa would be rather afraid if they knew that their present postal time was to be increased. We greatly regret that under the new arrangement made, we in this town do not have the advantages that we had formerly in regard to postal matters.

1724. **(Mr. Garnett.)** Do you say that you are worse off now in regard to your postal service than you were?—Our post has now to leave on Wednesday night, and we receive our mail on the Thursday, so there is a whole week which we cannot make any use of. Prior to present arrangement, our post arrived on Friday and went out on Sunday night, and therefore we had one day to reply to any matters. Of course, I suppose it is unavoidable. One part of the Union suffers and another gains by the new postal arrangements.

1725. **(Sir Rider Haggard.)** Is there any means of avoiding that?—**(Mr. Forsyth.)** It was done to give the people in London more time to reply, but it gives us six days.

1726. It is a big waste of time?—Yes. It was arranged in London. Formerly the mail arrived in England on Saturday morning and left on Saturday afternoon; that prevented Continental and provincial replies being received till the following week.

1727. **(Sir Alfred Bateman.)** There is a gain at the other end, then, under the new arrangement. How about the time it takes to send and get a reply? Do you get an answer to a letter from here sooner now or later?—If the man wrote his reply as soon as he received the letter, we would get it six days sooner. The new arrangement gives the man in London a longer time to reply to a letter from South Africa, and also gives us a longer time to reply to a letter from him. Rather too long. But I do not see how it is to be avoided.

TRANSVAAL.

Johannesburg, Friday, 3rd April 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For the evidence of these witnesses on "Migration, Land Settlement and Irrigation," see p.* 46; *on "Bills of Lading," p.* 91; *on "Railways, Harbours and Coal for bunkering and shipment," p.* 140; *on "Empire Development," p.* 161 *of this volume; and on "Exhibitions," see p.* 124, *on "Statistics," p.* 130, *on "General Trade Questions," p.* 173, *and "Legislation," p.* 183 *of* [*Cd.* 7707].)

The following extract from a letter from the Johannesburg Chamber of Commerce to the Commission was read by Mr. Soutter:—

Communications.

(*a*) *Mail Service.*—It is observed that a proposal has been submitted for a Joint Mail Service to the Cape and Australia—particularly with the view of bringing about more promptitude and regularity in the service to the latter country.

So far, however, as South Africa is concerned the contract with the Union-Castle S.S. Co. has more than eight years to run: and the existing service is regarded as satisfactory.

(*b*) *Ocean Freights.*—While the existing agreements between the steamship lines make for uniformity of conditions and also an arrangement of regular sailings (which is of advantage to importers) yet it is felt that the existing rates for the conveyance of merchandise to South Africa are very excessive.

(*c*) *Telegraphs.*—The Chamber would heartily welcome any proposals which would have the effect of cheapening cable rates to Great Britain; and undoubtedly every development in that direction is of material advantage to British trade.

Mr. Chappell read the following further memorandum on the questions:—

Memorandum re Mail Service and Ocean Freight.

In South Africa these two subjects are very closely associated with each other, on account of the agreement in existence between the so-called conference lines and most of the shippers to South Africa.

It will be within the knowledge of the Commission that the legal position of this agreement is at present the subject of arbitration in London. Hitherto the South African freight market has been governed by a system of deferred rebates, against which many objections were often urged. The present system is the result of:—

(*a*) The agitation against the principle of deferred rebates and in favour of an open freight market.

(*b*) The change of ownership that has recently taken place in the mail steamer lines.

It may be described as a compromise between the two systems. It gives the shipper a much freer hand than he has had for the past twenty years, whilst at the same time it maintains the convenience of regular sailings and the stability of freight—the latter an extremely important point to all holders of large stocks both here and at the coast, on account of the fluctuation in prices that would inevitably result, if freights were liable to considerable changes without any notice.

The Chamber considers that the rates of freight are high when the facilities for cheap coal and return freights are taken into consideration, and is of opinion that they might therefore be substantially reduced.

As already pointed out, the mail contract has still some eight years to run, and under the circumstances briefly sketched above, the advantages of discussing a joint mail service with Australia are not particularly apparent.

MEMORANDUM RE TELEGRAMS.

The system of week-end cables is considered by the Chamber to be a very real improvement, as every facility given in this direction is really a stimulus to trade. The further alterations that have come into force as from the first of this month partly comply with the requests that the Chamber has already made in this connection. They still leave two points to be considered, viz., the desirability of reducing the minimum charge of 12*s.* 6*d.* to, say, one-half that amount, which would be a great advantage to the poor man, enabling him to send a cable of ten words for that price; and there is a further improvement that would be much appreciated, viz., permission to use code words as well as plain language. At the present time it is impossible to send figures by means of these messages, as the words have to be used, and it would be an advantage if the same rule could be applied to these week-end cablegrams that obtains in the case of ordinary inland telegrams, viz., that figures up to the number of five can be sent as one word. The Chamber would urge the consideration of these three points, as their application cannot fail to facilitate commercial intercourse.

1728. **(Mr. Sinclair.)** In the first paper, under the heading "Ocean Freights," you suggest that the rates for the conveyance of merchandise are at present excessive. I should like to ask whether your Chamber has made representations to the shipping companies concerned to that effect?—**(Mr. Chappell.)** Representations have been made from time to time. I do not think they have been made particularly lately, owing to the recent date of the agreement, but they will probably be made in due course, because the public in South Africa generally think that the facility of return freights, which used not to exist in South Africa, and also the facility for cheap coal, which is also a new alteration, should be reflected in the freights to South Africa.

1729. We may take it that your Chamber will probably, in the near future, think it well to make specific representations to the shipping companies—to make, in short, the same representations that you are now putting before us?—Yes.

Johannesburg, Saturday, 4th April 1914.

Mr. NORMAN ANSTEY, Mayor of Johannesburg, called and examined.

1730. **(Chairman.)** You are Mayor of Johannesburg?—Yes.

1731. And the head of a large drapery establishment?—Yes.

1732. On the subject of week-end cablegrams, it has been said by some people that such messages are merely a diversion from the old full-rate cablegrams, and on the other hand it is held by some people that it represents actual new traffic which is to the benefit of the cable companies. Have you any experience?—Yes. We have always kept a separate account of cabling expenditure, and during 1912 our expenditure in cabling was a matter of 70*l.* Under that heading in the year 1913, when we began to make use of the week-end cables, the expenditure was largely increased and, as a matter of fact, practically doubled, being for that year 136*l.* as against 70*l.* for the previous year. And that ratio is continuing to increase, so that I find that for the first three months of 1914 it is actually at the rate of about 240*l.* a year. This I think goes to show that the great utility of the week-end cable is being made use of, and I have a table* here to show the Commission, if they are sufficiently interested.

1733. Yes, we should like to see it?—This is our usual cable book, and there is a cable here, for instance, which it would have been impossible to send by code in the ordinary way. (*The book was inspected by the Commission.*) A great deal of the work that used to be done by letter in the ordinary way is now done by week-end cable, greatly to the advantage of competitive business. We are in this way, through the medium of the week-end cables, enabled to wait a little longer before indenting, to see which way the demands of the public are tending. Sometimes one class of goods will be in demand and sometimes another. We are now able to wait another three weeks in order to see which way the demand is going before placing our orders, and that, of course, is of immense assistance in a business like ours, which is so dependent on fashion.

1734. That is of very great importance to you?—Yes, and of much assistance in competitive business.

1735. It comes to this, then, that by means of these week-end facilities you now send by cable what would otherwise go by letter?—It would have to. It would be practically impossible to code it. You will see the code messages in that book. They are now being used to the full extent as they were before, with the addition that we also use the week-end cable. We depend now more upon cables than upon the mail.

1736. Do you know at all whether in other kinds of business the same rule prevails?—Well, it is difficult for me to say. In connection with the trade of supplying mining materials, where lines of goods are in bigger quantities, they have always had to use the cable. Probably the same thing would not apply to them, or if it did, not to the same extent as in the case of a retail business.

1737. These facilities being novel, full advantage is just beginning to be made of them?—That is my experience. Although I am told the week-end cable came into force in November 1912, I find that it is during the last six months that we have taken full advantage of it.

1738. **(Sir Alfred Bateman.)** Your business is very much dependent on fashion?—Yes.

1739. You want to be up-to-date?—That is so.

1740. And judging from what I saw yesterday, you are as much up-to-date as you can be?—Yes. I think the ladies of Johannesburg are, generally speaking, very well dressed.

1741. Are you in communication with Paris?—Yes.

1742. By cable direct?—No; through London.

1743. I do not want you to say anything about your business, but I should like to know how you get your stock out. Whom do you cable to?—We cable to

* Not printed.

a firm of London agents, who attend to the whole of our buying business on the other side.

1744. Then do they cable to you a good deal? Are they in a position to know the changes of Paris fashions, for instance?—Yes; they have their people there.

1745. Because in regard to a certain business that I happen to be familiar with—a Luton business—they constantly send over people to the races at Paris—the heads of the firm and the lady managers—to see what is coming into fashion there?—Yes. Our London staff do the same thing. They go there regularly to gather ideas—not so much to buy.

1746. And perhaps you modify them?—Yes, more frequently.

1747. Do they make use of the cables in the opposite direction very much?—Not to the same extent. The usual method is to write and send samples, and we cable either by code or week-end cable for our requirements.

1748. Are there many similar houses to yours in Johannesburg?—Yes, there is quite a number, I think.

1749. I suppose all the other houses would do very much the same?—Yes, I suppose so. They would have to, or else get behind the times.

1750. Do you know anything about social cables or family cables?—No. I have no special knowledge of those. I know they are being used, but I do not think they are as yet sufficiently well known or appreciated to be adopted as fully as they would be.

1751. In the case of families where one member is here and another at Home, for instance?—They only cable on very special occasions, I think.

1752. They have not got into the habit of using the service instead of writing letters?—No. They do not cable to wish each other "many happy returns," for instance—usually speaking.

1753. Are you trying to get a reduction in the present rate or the minimum number of words?—I understand something is being done, but it has not yet come into force. There is some hitch in the negotiations, I have been told this morning.

1754. You find this arrangement very advantageous?—Yes, and I think if the rate was still further reduced we should use it even more fully.

1755. **(Mr. Sinclair.)** As further reductions come about, the cable will more largely take the place of the letter, you think?—Oh, no doubt.

1756. **(Mr. Tatlow.)** What reduction do you think should be made? Is not the charge at present a minimum of 15*s.* for 30 words?—That is the present charge.

1757. What is your view as to the reduction that should be made?—It is very difficult for me, as a merchant, to say how low the charge should be made, but it does appear to me that, were no additional expenses involved, if the charge could be reduced still further it would add appreciably to the cable companies' revenue and all additional business would represent additional profit. Therefore, if the cable companies could continue to reduce the charges until such time as the cable would be made general use of by the public I think it would be sound policy.

1758. Do you think the reduction in the minimum number of words would lead to a large increase in business, judging from your own requirements?—From my point of view, no.

1759. As far as you are concerned, the minimum is about right?—It does not matter very much. You will see from that book that we exceed the minimum on every occasion. But for social messages no doubt the minimum number of words could be reduced to advantage. For business purposes I do not think it makes any difference.

1760. You say it is not sufficiently well known. Is it not advertised in the post offices all over the country?—Yes, but information of that kind takes a long time to percolate through to the public.

1761. Apart from the Postal Guide, are not there prominent notices in the post offices throughout the country?—There may be, but my impression is that the general public is not very largely aware of these facilities.

1762. Do you not think they should be advertised in large characters in all the post offices?—But even then it takes time, and the question is whether such an expenditure on advertising would be fully justified.

1763. Your own expenditure in cabling has very largely increased—more than trebled—recently, judging by the figures you have given us, but if it had not been for this week-end rate would your cable expenses have increased so much?—No; I think they would not have increased at all.

1764. So it is greatly due to the cheaper facilities?—Yes.

1765. You would not have cabled those messages otherwise, at the ordinary rates, I suppose?—No, and in many cases it would have been quite impracticable to code them.

„ South Africa	64	
		676
Total		2,229

Subsidy per annum, 150,000*l.*
Average cost = 67*l.* per ton.

(*b*) ROME SEA TRANSIT RATES.

	£	*s.*	*d.*
Letters and postcards:—			
= 8 francs per kilo.			
= 2*s.* 10*d.* per lb.			
= 322*l.* 10*s.* 4*d.* per ton.			
292 tons =	94,174	17	4
Other articles:—			
= 1 franc per kilo.			
= 4½*d.* per lb.			
= 45*l.* 6*s.* 4*d.* per ton.			
1,261 tons =	50,839	6	4
Parcels:—			
= 1½ francs per parcel.			
= 1*s.* 2¼*d.* per parcel.			
328,210 parcels (676 tons) =	19,487	9	4
Cost of letters, postcards, other articles and parcels =	164,501	13	0

Average cost = 73*l.* 11*s.* 6*d.* per ton.

‡(*c*) AT SOUTH AFRICAN PRIVATE SHIP (STATUTORY RATES).

	£	*s.*	*d.*
Letters and postcards:—			
= 1*s.* per lb.			
= 112*l.* per ton.			
292 tons =	32,704	0	0
Other articles:—			
= 2*d.* per lb.			
= 18*l.* 13*s.* 4*d.* per ton.			
1,261 tons =	23,538	13	4
Parcels:—			
= 3*d.* per lb.			
= 28*l.* per ton.			
676 tons =	18,928	0	0
Cost of letters, postcards, other articles and parcels =	75,170	13	4

Average cost = 33*l.* 14*s.* 5*d.* per ton.

The South African private or non-contract ships (statutory) rates are—

Letters and postcards.—1*s.* for the first lb. and 6*d.* for each additional 8 ozs. thereafter.

Books and sample packets and newspapers.—2*d.* for the first lb. and 1*d.* for each additional 8 ozs. thereafter.

Parcels.—3*d.* for the first lb. and 1½*d.* for each additional 8 ozs. thereafter.

These rates are governed by section 40 of the Post Office Administration and Shipping Combinations Discouragement Act, No. 10 of 1911, which reads as follows:—

> 40.—(1) The master of any vessel (other than a vessel under contract for the conveyance of such mail) about to depart from any port within the Union who receives on board any mail for the purpose of conveying the same according to the direction thereof shall be entitled to demand and receive for the conveyance thereof payment at such rates as may be prescribed, and shall give a receipt for the amount so received by him: Provided that no master of a vessel shall be entitled to demand payment in respect of the second conveyance of any mail brought from one port to another and transhipped to or forwarded by a second vessel belonging to the same owner.
>
> (2) Payment for the conveyance of mails under this section shall only be made in respect of mails despatched from any port within the Union, and in no case in respect of mails received at any such port within the Union.

The above rates appear in "Schedule E" of the Regulations issued under the Act quoted.

* Based on Postal Union Statistics, 1913.

† Estimated on basis of 1912 figures.

‡ It should be remarked in connection with the above figures that the cost of conveyance has been calculated at South African Private Ship Rates on the traffic from South Africa as well as on the traffic to South Africa from the United Kingdom, although in the latter case the rates which would apply in practice would be the *United Kingdom Statutory Rates* which, however, are only partly known here.

General Manager's Office,
Cape Town, 26th March 1914.

APPENDIX IV.

Statement handed to the Commission at Port Elizabeth, on Friday, 13th March 1914, by Mr. R. P. Hannam, of the Firm of Hannam & Co., Port Elizabeth.

Deferred and Week-End Cablegrams.

The sender of a "deferred" message is required to make a declaration giving a formal assurance that the text is composed entirely of plain language, and that it bears no other meaning than that which appears on its face. In view of this fact it seems not unreasonable to suggest that the underlined portions of clause 114 of Cablegram Rules and Regulations, as given below, should be withdrawn. If this was done it would very considerably facilitate business communications.

Clause 114.—No *figures (these must be written in words), commercial marks*, groups of letters, signs of punctuation (unless conforming with the text), or *abbreviated expressions* may be included in the text of "deferred" telegrams; neither may the text be composed of isolated letters or of words not having a clearly connected meaning. Messages without a text are not admitted. *Exceptionally*, a registered code address may be included in the text, provided the sense of the message makes its meaning clear. *Figures are admitted in the address and signature.*

Clause 123, relating to week-end cablegrams only and not to deferred cablegrams, provides that messages may be telegraphed to cable stations at the ordinary telegraph rates. It would be of great benefit if such cables could be sent from any telegraph office in the Union without additional charge for telegraphing to the cable station. This would enable those situated away from cable stations to send their cablegrams on Saturday free of extra telegraph expense, instead of, as at present, having either to send them some days beforehand by post or incur the extra expense of telegraphing to cable stations.

Mr. Hannam was questioned by Sir Rider Haggard, Mr. Garnett, and Mr. Bowring with regard to this memorandum.

He made it clear that so far as Port Elizabeth was concerned the week-end telegrams were mainly used by the business community. It was suggested to him that it would be of much convenience if a week-end telegram of ten words, costing 5*s.*, could be introduced into South Africa. He agreed that this innovation would be very desirable, and was of opinion that it would be an advantage even slightly to increase the rate, say, to 9*d.* per word, provided that the minimum of words were reduced, say, to ten.

APPENDIX V.

Memorandum furnished to the Commission by Sir Maitland H. Park, Editor of the "Cape Times."

With the permission of the chairman and the members of the Dominions Royal Commission, I should like to put in a short statement in regard to one or two points of interest to the newspaper reading public in South Africa.

1. The reduction of the Press cable rate between Great Britain and South Africa from 1*s.* to 3½*d.* has been greatly appreciated, and has caused a marked expansion in the volume of Press messages. Practically the whole benefit of the reduction has been given to the public; that is, the money saved has been expended in an extension of the news service.

2. The recent experiment of a week-end cable for private purposes at reduced rates—15*s.* for 30 words—has been successful, though it would be still more successful if the conditions were made more elastic. If a week-end message of from 10 to 15 words could be sent for 5*s.* the value of the new departure to the general public would be greatly enhanced. But, as the editor of a South African newspaper, my object at this moment is rather to suggest an extension of the experiment for Press purposes.

A feature in the leading newspapers in South Africa is a weekly news-letter from London. The "Cape Times," in addition to a letter concerned with political and general news, has special letters dealing in greater detail with society and the drama, fashions, naval and military intelligence, and the wool trade. These letters, however, are necessarily about three weeks old at the date of publication. If the cable company could be induced to quote a special rate—say, 1*d.* a word up to 800 words—for a weekly cable, a comprehensive news-letter every week-end would become practicable for at least four or five of the most important dailies. This might also induce the English newspapers to set apart a column once a week for oversea news. At present I understand that more than 50 per cent. of the Press news cabled from South Africa to London from day to day is crowded out. Possibly a weekly review cabled at specially reduced rates might have a better fate.

3. A short time ago the British Postmaster General had a one-clause Bill passed through Parliament, the effect of which is to give overseas papers reposted in London the benefit of British postal rates; that is ½*d.* each, regardless of size, instead of ½*d.* per 2 ozs., as formerly. As Chairman of the South African Branch of the Empire Press Union I desire to put on record the acknowledgment of the South African Press for this concession, which will undoubtedly help to promote the diffusion of Imperial news.

But, as the London Executive of the Empire Press Union has consistently urged, the time has come for a much more important change in the same direction. Except in Canada, where a newspaper postal tariff of 1*d.* per lb. weight is in vogue between the Dominion and the Mother Country, the general rate throughout the Empire is ½*d.* for every 2 ozs. This means in practice that very few newspapers outside Canada can be transmitted at less than 2*d.* a copy, which is a heavy handicap on the free interchange of Imperial news. If we cannot have a universal Empire rate of 1*d.*, irrespectively of weight, the Canadian tariff of 1*d.* per lb. might be applied. Or if, on financial grounds, this proposal seems too formidable, a 1*d.* per half pound would at least be better than ½*d.* per 2 ozs. The British Post Office, as far as I can understand, objects solely on financial grounds; but it is not clear that the financial loss would be material if the concession were confined to newspapers. The British Postmaster General has argued that what is conceded to newspapers must be conceded to magazines; but, if the real obstacle is financial, and financial considerations do not come into play in the case of newspapers, or not to anything like the same extent as in the case of magazines, then I can see no good reason why impracticability in the one case should be held to block practicability in the other.

4. There is one other point to which it may be worth while to call attention. The newspapers in any one Dominion usually get their cable news regarding the events in the other Dominions through London. London is the Empire's journalistic clearing house as well as its financial clearing house. But direct communication between the Dominions is occasionally necessary, and ought certainly to be encouraged. So far as Press rates are concerned, it is at present heavily penalised. I had to cable a few weeks ago to Toronto and Melbourne for news which was of special interest to South Africa, but was not at all likely to be transmitted through London. I found that I had to pay 1*s.* 5*d.* a word for the Canadian message, and 1*s.* 1*d.* for the Australian message. Similarly, the rate to India and Ceylon direct for Press messages is 1*s.* 2*d.* The two messages together cost me over 30*l.* These rates, to my thinking, are utterly absurd at this stage in the development of Imperial cable communications.

Maitland H. Park.

(b) Bills of Lading.

CAPE OF GOOD HOPE.

Cape Town, Monday, 2nd March 1914.

Mr. Advocate Louis Edmund Benjamin, K.C., LL.B., called and examined.

(*For the evidence of this witness on "Legislation" see p.* 178 *of* [*Cd.* 7707].)

1766. **(Chairman.)** What are the laws in force in the Union in regard to bills of lading?—The law is the same as in England, that was taken over in 1879.

1767. Has there been any agitation here in favour of adopting Australian or American law regarding Bills of Lading?—No, none at all. As a matter of fact there is not much litigation in the courts here in connection with carriage by sea, the greater portion of it goes to England, and hence the advisability of adopting one or the other system has not been considered up to the present time. The reason why the English law was adopted was this: In 1879 there were two courts of concurrent jurisdiction here, the Supreme Court of Cape Colony and the Vice Admiralty Court. The Vice Admiralty Court applied English law and the Supreme Court Roman Dutch law, so that the redress which was obtained in any particular case depended upon the particular court in which the action was tried. The absurdity of the thing was recognised and consequently an Act was passed in 1879 by which it was provided that English law should prevail in all questions in which the Vice Admiralty Court had concurrent jurisdiction with the Supreme Court.

1768. **(Mr. Sinclair.)** In regard to bills of lading uniformity would seem to be desirable as far as it is possible to bring it about?—Yes. As a matter of fact

our law at present is substantially the same as the English law.

1768*a*. It was suggested to the Commission in one centre that if bills of lading were narrowed in the interests of the shipper of goods it might have the effect of diverting trade to lines that adopted a broader bill of lading. Do you think that there would be any likelihood of that?—I think there probably would be.

1769. In considering some general law in connection with bills of lading I presume the general effect of the law would be taken into consideration?—As far as South Africa is concerned there would be no difficulty in falling into line with the Mother Country on whatever policy they adopted in connection with bills of lading. Whatever policy would most encourage the trade of the Empire would also tend to encourage South African trade.

1770. Have you had any cases in your practice as a barrister from which you can give the Commission any assistance as to bills of lading broadly. Have you had any difficulty here. Does your bill of lading contract the steamship company out of liability for negligence?—All the bills of lading we have here are substantially drawn in English form. There is very little local sea trade here. The greater portion of the sea trade comes over the high seas.

1771. Have you local legislation that interferes in any way with the right of the steamship proprietor to contract himself out of liability for negligence?—No.

Cape Town, Wednesday, 4th March 1914.

Mr. K. SPILHAUS, of Messrs. William Spilhaus & Co., called and examined.

(*For the evidence of this witness on "Freights" and "Bunker coal"* see *pp.* 74 *and* 105.)

1772. **(Chairman.)** I think you have also some evidence on the subject of bills of lading. What have you to say?—I have nothing very much to say, but I was told that you wanted to ask some questions. The only thing I would like to say is that there should be a uniform grain bill of lading throughout the Empire, but I should not wish it brought about by legislation. On the contrary, I prefer it to come about by common agreement between the shipowners and the shippers.

1773. Do you have any difficulty here with the shipowners as to the terms of your bills?—There has been some query now and then. The clauses of bills of lading operate more on the receiver than on the shipper. We sell on the terms of the South African bills of lading, and if there is any complaint we are not so much concerned, it is the receiver in London who has more to say. We have heard, and our friends have written to us, that they have made representations to the conference lines to get some clauses altered on the bills of lading.

Kimberley, Wednesday, 18th March 1914.

Mr. ARNOLD WILSON WALL, Manager of Messrs. Stewarts and Lloyds (South Africa), Ltd., called and examined.

(*For the evidence of this witness on "Irrigation,"* see *p.* 28.)

1774. **(Chairman.)** You wish to give evidence on the subject of through bills of lading?—Yes, I am distinctly in favour of through bills of lading, for this reason, that it brings the man who buys and the British manufacturer closer together. At present, if a man in Kimberley, for instance, wants to buy a plant, or an engine, or a windmill, or anything of that kind, he more or less goes to the merchant either in Kimberley or in Port Elizabeth. The result is that he does not do his business direct with the manufacturer, and he gets his goods, as I call it, second-hand. I think if the people who use the machinery were able to import it direct, and if facilities were offered by the Government for doing it, not only would they get better material, but also much cheaper, because they would obviate paying, in most instances, the merchant's commission. Perhaps they buy it from a man in Kimberley who, in turn, has bought it from the merchant in Port Elizabeth, or one of the other coast towns. Further than that, on the grounds of expense, I see no reason why in this country, where the railways are owned by the State, and goods landed by the Government and carried over railways by the Government, the Government should not also go a step further and do the forwarding. At present, if a man in Kimberley imports from home, he has to instruct the agent at one of the coast ports, giving him details, and this agent naturally charges a fee, which I consider, at any rate, to be excessive. If we could get a through bill of lading the whole of that expense would be obviated. He would then get a price from Birmingham or Glasgow, or wherever it might be, delivered in Kimberley, and the goods would come right through, and he would be saved the expense and trouble of instructing the agents and also save the agents' fees, and be in closer touch with the manufacturer of the goods which he imports. The Government some months ago did move in this matter, but unfortunately the scheme was abandoned, and that is why I am raising this question to-day and bring the matter before this Commission, because I think, more especially from the buyer's point of view, it would be a distinct advantage if through bills of lading could be adopted. I have made several inquiries in England, and I find it is quite a common practice there for goods to be shipped from, say, Germany direct to Birmingham, perhaps *viâ* Cardiff, and the railway people there do all the necessary work, and, as far as I have been able to ascertain, it has worked quite satisfactorily, and I see no reason why in this country a similar condition of affairs should not exist. Of course, the opposition which has been put forward to my argument is this: the merchant says,—If you are going to do this you are going to have the private consumer going direct to the manufacturer, and we poor merchants are going to starve. But I do not think there is much in that argument, and the advantages that would accrue to the consumer are so great that I think they would far outweigh the little disadvantage in the case of the merchants. And I do not think their argument holds good either in this way, because in my experience of suction gas-engines or windmills, the farmer or consumer who buys the plant always wants you to erect it, as it would be quite impossible for the ordinary farmer to put up an engine. He has not the necessary technical knowledge himself

and as long as that knowledge is required I do not think the merchant or other people who do this work are going to suffer. But if you adopt the through bill, the man is going to get his stuff much cheaper than under present conditions, where he has to pay the merchant here or in Port Elizabeth, and also agents' fees, which I consider are too high at present for clearing the goods.

1775. As things are at present, I understand, the farmer in the Free State or the Transvaal who wants to buy a windmill or suction gas-engine can write to a firm in England and get it out?—Yes, but he would not do so, because he requires skilled assistance to put it up.

1776. Would the through bills of lading obviate that skilled assistance?—No. But my contention is that the farmer would be able to get the plant cheaper by getting it direct from Birmingham or Glasgow.

1777. What is his actual difficulty in doing that now? Is it that he cannot get the goods through the Customs without the local agent?—Yes, that is my point.

1778. And you would suggest the Government should clear those goods?—Yes.

1779. And forward direct to him?—Yes.

1780. (**Mr. Campbell.**) In this proposal to have a through bill of lading, if the business grew into large dimensions, it might tend to wipe out the machinery importer altogether I should think, would it not?—No, it could not wipe out the machinery importer, because he is the man who always erects the machinery. Seeing that a farmer cannot put up the engine by himself he must have someone to assist him.

1781. That would be a gain to the importer of the machinery?—Yes, but the through bill of lading is indirectly more gain to the farmer.

1782. Is the competition among the importers of machinery sufficient to ensure that the gain they get on the through bill would be passed on to the farmer?—Undoubtedly.

1783. There is keen competition among the importers of machinery here?—Yes.

1784. (**Mr. Lorimer.**) Do your own goods from Stewarts and Lloyds come through on your own bills of lading?—No. We have no through bills of lading in this country.

1785. Do you advocate their adoption universally?—Undoubtedly.

1786. Without any qualification?—Yes.

1787. Suppose a merchant in Cape Town were to receive goods for twenty different customers: how would he deal with a case like that?—If the merchant had twenty different customers and twenty consignments to send it would undoubtedly pay him to send them from his Cape Town stocks. The through bills of lading I refer to are more particularly for larger consignments.

1788. In that case, you would require to continue the present system in combination with the other, would you not?—Yes.

1789. That is what I meant when I asked you whether you proposed to adopt through bills of lading exclusively without any qualification. That would be quite impracticable?—Yes.

1790. Where would the railway come in in the adoption of the through bill of lading?—They would do the forwarding. At present they off-load the goods from the steamer and put them on the quay and you have to employ an agent to instruct them how they are to forward the goods. My point is that the Government, seeing that they off-load the goods from the ship and carry them from the port to the point of destination, might take the next step and arrange the forwarding.

1791. If they undertook that additional work they would naturally expect additional pay?—Yes.

1792. If there were additional payment equal to the agent's commission what advantage would accrue to the receiver?—None.

1793. Then on what ground is it that you advocate this change? The effect would be to eliminate the middleman, would it not?—It would have that tendency, but my contention is that the Government would not charge the fees that the agents are charging.

1794. You mean that the Government would do the work for less than the middleman now charges?—Yes.

1795. Do you suppose in that case that the saving would go to the ultimate buyer?—Undoubtedly.

1796. Would there be any further advantage accruing—any further advantage in security, any further certainty as to prompt delivery?—Yes, I think so. The man who was buying the machinery or consigning the goods would not have to put it through the merchants and he would get his goods direct from the seller.

1797. But what do you lose under your present system that you would gain under that system? Or what would you save by the adoption of the other system?—I would save considerably personally in agent's fees. I have to employ agents at the coast and I would save a considerable amount of money in the year—running into hundreds of pounds.

1798. You, as a large importer, would save certain fees?—Yes.

1799. But the general merchant, in order to provide for the other customers which he has all over the country, would require to continue to import the goods direct to the port of shipment and dispose of them afterwards himself?—Yes.

1800. So that, after all, the change you advocate is one mainly that would be to the benefit of the large importers?—No, I would not say that entirely. It is for the benefit of the large importers, certainly, but at the same time it is very much for the benefit of consumers.

1801. How so?—Because at the present time the consumer is not inclined to go to the trouble of getting prices at home, because he thinks the difficulties of importing are too great. He would rather employ a merchant to do it. The small consumer now gets his goods through the merchants in Cape Town or elsewhere.

1802. And under any circumstances he would still require to do that. I want to know what saving would be effected—what advantage would accrue to him in the event of such a change as you advocate being introduced?—The small consumer—it would not pay him, of course. Because it is quite obvious that if you want to buy something for 5*l.*, and by importing it direct from England you could save 5*s.*, you would say, "No, I will buy it from some local agent." But when it comes to paying 500*l.* or more, my contention is that the saving effected is so great that it would pay him to import direct.

1803. You yourself, resident here in Kimberley, would naturally save the usual agent's commission, which at present you have to spend in Cape Town or Port Elizabeth, and that is the basis of your plea just now, is it not?—Not the only basis.

1804. Have you anything else?—Yes. My contention is that the consumer, on account of these facilities, would buy in the home market, whereas now he buys from the merchant.

1805. Speaking from your point of view, you import articles which never get into the hands of the small consumer at all?—Yes.

1806. So that your point is that if you and all large importers like yourselves imported direct a certain saving would be effected by eliminating the middleman altogether?—Yes.

1807. And that in respect to the small consumer the present system would continue?—Yes.

1808. (**Mr. Sinclair.**) Is your suggestion on the subject of through bills of lading founded on the overcharge that you think is made?—That is one of the reasons.

1809. Do you suggest that that charge is so great that the Government ought to enter into competition?—Yes.

1810. Do you propose to submit any closer evidence of such overcharge?—I can tell you that the finest rate, for instance, that I am able to get in Port Elizabeth for clearing goods is 1*s.* per ton, and the Government at present will clear your goods in Durban for 3*d.* per ton.

1811. And that is the principal factor, is it, in inducing you to make this suggestion?—I would not say it is the principal factor, but it is certainly one.

1812. It looks as if it were the principal one, does it not?—I do not think so.

1813. As the Chairman has put it to you, there is nothing to prevent a man buying direct from the manufacturer, even at the present time, if he wishes to do so?—Yes.

1814. And those goods could be shipped by through bill of lading to Cape Town?—By ordinary bill of lading.

1815. And it is the difficulty that you suggest exists in regard to the charge at Cape Town that makes you put forward this suggestion?—That is one of the difficulties, but my principal objection is that the system at present in vogue is such that it prevents buyers going into the home market for their wants.

1816. **(Mr. Garnett.)** You said, I think, that your main desire was to eliminate the middleman?—No. Perhaps I do not understand what you mean by the term "middleman."

1817. Well, you say there are a number of people between the man on the soil who wants something and the manufacturer at home?—Yes.

1818. And you desire to put those two people *en rapport*, so to speak, with one another?—Yes.

1819. And that being done, the intervening people disappear?—Yes.

1820. Is that not eliminating the middlemen?—Yes.

1821. What class of goods have you principally in your mind?—Suction gas engines and windmills.

1822. What is the practice to-day? Supposing someone up-country wanted to put in a suction gas engine or windmill, what is his practice to-day?—He gets the Kimberley or Port Elizabeth merchant to order it for him.

1823. What services does he get for that; what services does the merchant perform?—He orders the goods from the home manufacturer, brings the machinery out, and erects it.

1824. Anything preliminary to that?—Yes, well, the preliminary work of dealing with the inquiry.

1825. Supposing a farmer requires a gas engine or something of that sort, has he sufficient technical knowledge to enable him to ascertain the horse power necessary and make out a specification and send it to the manufacturer?—No.

1826. Does the merchant in Kimberley do any of that work for him?—Yes, for which he charges.

1827. Well, I suggest to you that if a man is hundreds of miles away from the maker of the machine and has not sufficient knowledge to draw up a specification, a very considerable service is performed by the middleman who draws up such specification?—Yes. But I think if I were a farmer I would rather get the plant on a through bill of lading, and would employ the services of a qualified engineer if I could not draw up the specification myself.

1828. Would it be more advantageous to resort to the opinion of a consulting engineer or to the opinion of a firm which is continually dealing with these things?—That is a matter of opinion. Personally, I would go to the engineer.

1829. I submit to you that, in the elimination of the middleman, the buyer who is put into communication with the manufacturer at home, unless he selects some other technical adviser, may be losing some expert advice which at present is very valuable to him, and which is well worth the payment he may have to give?—Yes.

1830. You admit that services of that sort are performed by these importing merchants?—Yes.

1831. **(Sir Jan Langerman.)** I take it that your objection is to the landing and forwarding agent?—Yes.

1832. Is Natal exempted?—In Natal the Government does the work.

1833. All the work?—No, it is optional. If you want them to clear the goods they will do it.

1834. And you want that principle in the Cape Colony?—Yes.

1835. Are you aware that last year a Bill was passed whereby the Government has power to do it at other ports as well?—Yes.

1836. And since the Bill was passed, have you represented the matter to the Government?—Yes, and they reply that they are not prepared to undertake the work yet.

1837. Then it is purely a local matter? If you can show to the Government that it is desirable for them to do it they will, I suppose?—I have already represented the matter, and they say they are not prepared to do it.

1838. So there must be some reasons which prompted the Government not to introduce the Natal principle here?—I suppose so.

1839. The Government can do it at any time?—Yes.

1840. **(Mr. Bowring.)** The middleman to whom you have referred, and whom you say should be eliminated, is the forwarding agent at the coast?—Yes.

1841. Who now charges you 1*s.* a ton on all goods forwarded?—Yes.

1842. What services does he render for that shilling a ton?—He passes Customs entries and instructs the railway where to send the goods.

1843. Does he pay the freight?—No.

1844. Who pays that?—Usually it is paid by the man who receives the goods.

1845. In Kimberley, for instance?—Yes.

1846. Although you have no through bill of lading?—Yes.

1847. Does the shipping company collect the freight in Kimberley?—No, in many instances the shipping company collect it in England.

1848. It is prepaid freight?—Yes.

1849. Is that done in all cases?—No.

1850. What is done in other cases then?—That I cannot tell you. I do not think the forwarding agent pays the freight though.

1851. Because the ordinary forwarding agent, I presume, would clear your goods at the Customs, pay the duty, pay the freight, and forward the goods?—I do not think so.

1852. You cannot pay duty in Kimberley, can you?—No.

1853. But you can pay freight?—Do you mean by freight the carriage from the port to Kimberley?

1854. No, I mean the ocean freight.—Oh, no. On the question of freight I cannot tell you. In my own particular case the freight is paid on the other side.

1855. What I want to find out is what services does the forwarding agent at the coast render for the shilling a ton?—The services are, I think, what I have enumerated. I do not think he pays the freight.

1856. Even if it were not prepaid?—No.

1857. Then it must be paid in Kimberley, and he collects it?—That I cannot tell you.

1858. At any rate, you would not consider it excessive for a man to charge 1*s.* a ton if he had to pay the freight and the duty and forward the goods and undertake the collection of those charges here in Kimberley?—Yes, I think it would be excessive, when the Government, at the Port of Durban, will do it for 3*d.*

1859. I want to come to that. I want to see what the other coast towns will do it for, and then what the Government will do it for in Durban?—Yes, as regards the shilling a ton, that is quite an absolute minimum, in fact, most firms would pay 1*s.* 6*d.* or 1*s.* 9*d.*, and in some instances 2*s.*

1860. But that would include other services, I presume?—No, I do not think so.

1861. When you come to Durban, where the Government do it for you for 3*d.*, what do they do?—They act as shipping agent.

1862. Forward the goods to destination?—Yes.

1863. Clear them at Customs?—Yes.

1864. I presume they pay the duty?—No, you pay your duty at the destination, at Johannesburg. The bulk of the goods for Johannesburg come through Durban. What the Government will do is this: they say, "If you will pay us another 3*d.* a ton we will bring

the goods to Johannesburg for you, and there you may clear them."

1865. In Johannesburg, then, they have the privilege of paying the duty instead of at the coast town?—Yes.

1866. And you have not got that privilege in Kimberley?—No.

1867. The Government in Durban is doing more than the forwarding agent in the other coast towns?—Yes, in so far as they forward the goods and collect the duty at the town of destination.

1868. Then the forwarding agent at Cape Town, East London, or Port Elizabeth must pay the duty—that is one of the services?—Yes.

1869. He pays the freight, if it has not been prepaid, and forwards the goods?—I do not think he pays the freight.

1870. The Government, on the other hand, puts your goods through and collects all the charges at the town of destination?—Yes.

1871. So Johannesburg is more favourably treated than you are here in Kimberley?—Yes.

1872. **(Sir Rider Haggard.)** Suppose that the existing system of parcel post could be very much enlarged so that goods could be forwarded by it, and the duty on such goods collected at the place of arrival, would that meet with your views?—Yes.

1873. Have you ever considered that idea?—Yes.

1874. Have you ever urged it on the Government?—No, I have never gone so far as that.

1875. Would not that eliminate all the objections which you have alluded to?—Yes, in a measure.

1876. Would it not prove a great boon to commercial communities?—Yes, more especially for the small importer.

1877. One might even take it down to the agriculturist forwarding goods to markets?—Yes. I am glad you raised that point. I quite forgot that when I put this matter before you. Seeing that the Government will at present land your goods absolutely right at your door from oversea if you send them by parcel post and collect all the charges and the duty thereon, surely it is possible for them to go another step.

1878. **(Mr. Lorimer.)** I would like to ask what reason the Government gave for undertaking the clearing and forwarding of goods at Durban and refusing to do it elsewhere?—I am afraid I cannot tell you that.

1879. **(Chairman.)** The clearing agent at the port is able to check the condition of the goods on arrival and see if any damage has occurred on board ship?—Yes.

1880. Is not that a considerable advantage?—Yes.

1881. Would the Government do that at Durban? Do they also verify the sound condition of the goods on arrival?—I do not know.

TRANSVAAL.

Johannesburg, Friday, 3rd April 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation,"* see *p.* 46, *on "Posts, Telegraphs, and Steamships," p.* 81, *on "Railways, Harbours, and Coal for bunkering and shipment," p.* 140, *on "Empire Development," p.* 161 *of this volume; and on "Exhibitions," see p.* 124, *on "Statistics," p.* 130, *"General Trade Questions," p.* 173, *and on "Legislation." p.* 183, *of* [*Cd.* 7707].)

The following extract from a letter from the Johannesburg Chamber of Commerce was read by Mr. Soutter:—

(A.)

Bills of Lading.—It is observed that suggestions have been put forward for the institution of through bills of lading from England direct to consignee. The Chamber sees no need for this, and, indeed, if a definite proposal were put forward, it would be strongly opposed as tending to interfere with the trade arrangements existing in this country.

1882. **(Mr. Sinclair.)** Your Chamber is not in favour of a suggestion that was made to us at one place, namely, the adoption of through bills of lading?—**(Mr. Chappell.)** No.

1883. You do not think there really would be a gain by the cutting out of the middleman, which, I take it, is one of the objects of the proposal?—At one time here in South Africa we had through bills of lading in certain lines. That was before the war. But they were not found to be a great convenience. As a matter of fact, they were relinquished automatically.

APPENDIX.

(B) Bills of Lading.

Letter from Mr. R. P. Hannam as to Clauses in Bills of Lading.

Port Elizabeth,
Cape of Good Hope,
13th March 1914.

Dear Sir,

In response to your request that I should write you my personal views regarding clauses at present existing in bills of lading, I would say, in dealing with this question, that many clauses at present current practically contract shipowners out of liabilities which under common law they might be responsible for.

I am of the opinion that legislation should be introduced as far as possible, and as far as is equitable to both shippers and shipowners, to prevent evasion of claims which appear to carry with them moral liability upon shipowners, but which are not recoverable by shippers, by reason of the fact that their legal force is disposed of by clauses in the bills of lading.

In view of the combination amongst shipowners, shippers would find it extremely difficult to get their goods carried at all unless they accepted bills of lading with these prohibitive clauses in them.

Presuming that the claims referred to arise in all cases from what might be more or less legitimately described as accidents, and are in no way caused by malicious damage, it is reasonable to suppose that in most or almost all cases such damage should be insurable. In practice, however, it is found that the insurance companies do at times refuse to pay some claims which they describe as not insurable risks.

In a case which occurred during the present month, one such claim was paid to our firm under protest by the local insurance company, whose agents anticipated that their company's head office in London would question the legitimacy of our claim against them. This particular case is, I think, a typical one, in which the consignee, and probably the underwriter, should not be called upon to bear the loss.

The damage was occasioned by the steamship company electing to discharge the cargo, which was sugar, from the hold of the ship, in slings which were wet. Presumably discharging took place during rain, which wetted the slings and damaged the cargo. The

lighter which received the cargo gave a qualified receipt for it owing to its being wet.

The bill of lading provides that the master of the ship is free to discharge cargo at all times and in all circumstances, and under this clause the shipowner repudiated liability.

It can be argued from the shipowner's point of view that it is essential for them to contract themselves out of liability due to negligence, and if this aspect represents a serious consideration to them, as it must do, then it seems to me that the onus of insurance against at least petty damages due to such negligence lies with the shipowner and not with the shipper or the consignee.

There appears to be sufficient margin on the present rates of freight to enable the shipowner to undertake the cost of such insurance without raising freight rates, but, if there is not, I personally would prefer to pay a small extra freight cost in exchange for the withdrawal of some of the restrictive clauses on the bills of lading now existing.

I can quite believe that there will be a large number of shippers and importers who would not favour any such extra charge, even though it carried with it the benefit of doing away with clauses in bills of lading which at present prevent them from establishing claims which would otherwise be recoverable from shipowners.

I do not think that any scheme under which shipowners adopted the whole responsibility of insurance in exchange for an absolutely clean bill of lading would be in any way acceptable because it would too greatly disturb present vested interests of underwriters; and shippers would not necessarily be satisfied with the security of cover that they themselves did not select.

I think that the individual shipper or consignee should be left free as at present to insure his own risk against any loss that is recoverable where any protest has been extended by any ship.

Legislation may be necessary to prevent the abuse of the extension of protests.

I realise that the question is hedged with difficulties, but if some method could be devised under which present petty losses, which are in no way ordinary perils of the sea and which fall upon the importer, and for which the shipowner is morally liable, could be legally established against the shipowner, it would constitute a great benefit to the importing community.

At present such losses as are referred to herein are borne entirely by the consignee, whereas if a universal extra cost was added to the freight (if necessary, which I do not think the case), then such loss would be distributed and would ultimately fall upon the consumer.

In conclusion I would say that it is extremely difficult for a consignee to establish a claim against the shipowner in any court of law, because the weight of evidence is so largely with the shipowner. Although the onus of proof to show that due diligence was performed rests with the shipowner, it is an almost impossible matter for the consignee to disprove any evidence that is given.

Your truly,
R. P. HANNAM.

E. J. Harding, Esq.,
Dominions Royal Commission,
Port Elizabeth.

(c) Railways, Harbours, and Coal for Bunkering and Shipment.

CAPE OF GOOD HOPE.

Cape Town, Thursday, February 26th, 1914.

Mr. G. T. NICHOLSON, Resident Engineer, Table Bay Harbour, South African Railways, called and examined.

1884. **(Chairman.)** You have given us certain figures which have been summarised together with those of the other ports* in South Africa. But I think you have a more detailed statement?—Yes.

1885. Would you like to summarise it verbally?—Yes.

1886. Will you please do so?—With regard, I suppose, to the improvements, principally?

1887. The present accommodation here and the improvements for increased accommodation which are in contemplation.—At present we can accommodate about 16 steamers. We have one berth available for a steamer drawing 34 ft. 6 ins. A number of berths we cannot, of course, deepen, in view of the fact that the old harbour was built upon sand. The South Arm and the Knuckle and the East Pier are all on sand, but a scheme has been put forward whereby we shall be able to get deeper water at two of the present jetties—we are reconstructing at the present moment—37 feet at number 2 and 38 feet at number 5. One is 640 feet long and the other 690, so you will get at these jetties four very good berths for deep draught vessels.

1888. Your length of berth at the East Pier is what—1,000 feet?—No, 786 feet. That is our deepest berth at present, and the Port Captain allows 18 inches for clearance. I may say we have the "Ceramic" booked for May, and she has intimated that she will draw 34 ft. 6 ins., and we will be capable of taking her in after a little dredging.

1889. Then with regard to further improvements; have other schemes been prepared and submitted to Parliament?—Yes, a scheme was prepared in August 1912, and submitted to the Government by myself and the Assistant Port Captain, and approved by the Government, and the estimate was 3,048,160*l*.

The full scheme is this:—

No. 2 jetty reconstruction already in hand, 90,529*l*

Deep-water berths provided in the new scheme, including the two berths at No. 2 jetty and the existing East Pier berth:—

No.	Position.	Length.	Depth below L.W.O.S.T.
4 berths	A and B (on litho) -	900 ft. each	40 ft.
1 berth	Inside Knuckle extension.	1,500 ft.	40 ft.
1 ..	Widening South Arm	900 ft.	Average 40 ft.
1 ..	Outside East Pier -	786 ft.	40 ft.
1 ..	No. 3 Quay Knuckle	830 ft.	36 to 43 ft.
2 berths	No. 3 Jetty - -	690 ft. each	38 ft.
2 ..	No. 2 Jetty - -	640 ft. ..	36 ft.
1 berth	East Pier (existing)	786 ft.	35 to 36 ft.

* *See* Appendix V., p. 157.

Estimate for plan, 3,048,160*l*. Of this amount there is already sanctioned, or being sanctioned, 325,000*l*., to be expended as follows:—

	£
Reconstruction No. 3 jetty	109,500
Outside berth, East Pier	179,500
Protecting Arm, South Arm knuckle	36,000
	325,000

1890. Then the improvements you contemplate in the Victoria Basin will be completed in the course of the next two years?—Yes, two and a half years. We will have No. 2 complete, I hope, in twelve months. I should say that in two and a half years we will have four deep-water berths.

1891. When do you propose to commence work on the new basins shown in pink here on this plan*?—Well, the only portion shown in pink is that protecting arm.

1892. We are now talking about the Victoria Basin?—Yes.

1893. Here, there is another large basin indicated in pink?—The first portion we intend starting with as a protecting arm. Of course, our great point is to get these two jetties completed as soon as possible.

1893A. I do not see where the two jetties are?—(*Witness indicated the position on the plan.*)

1894. What is the pressure on your harbour accommodation? Are you full of vessels?—In the early part of the week, on Tuesday, I know there were 16 vessels inside and one outside. That is all we can accommodate.

1895. You are absolutely full this week?—Yes. On Tuesday they did not know where to put the vessels.

1896. Now about the anchorage outside: Are you contemplating any measures for the improvement of it by extending the breakwater or by dredging?—The breakwater is to be extended as a part of the scheme.

1897. We may take it, then, that if this scheme is put through in the next two and a half years you will be able to accommodate vessels drawing up to 36 feet 6 inches of water?—Yes.

1898. With a length up to 800 feet?—700 feet.

1899. 786?—Yes, say, 750 at the East Pier.

1900. Can you tell us about the Australian vessels calling here: you have a large number of vessels bound for Australia which call for coal?—Yes.

1901. What operations do they go through?—They are coaled from the quay direct from the truck by electric cranes, and from the waterside. Probably two-thirds from the quay and one-third from the lighter.

1902. Do they take on cargo?—Not a great amount.

1903. And the Australian boats homeward bound, do you have a large number?—Yes.

1904. For similar operations of bunkering?—Yes, but not very much on the homeward voyage; they take more at Durban. Of late, they have been filling up with cargo instead, cargo being the most paying proposition, on the outward voyage.

1905 Where do they re-coal?—Here. They often take up to 2,000 tons.

1906. (**Sir Alfred Bateman.**) Is there a tendency of late years to take more coal at Durban and less here in the home-going vessels?—Yes. I think that is more of a traffic question. They have the figures, which would be more authentic on the question.

1907. You say they take more cargo?—They fill up with cargo when they leave home, and fill up bunkers here.

1908. (**Sir Rider Haggard.**) Is there any difficulty here in ultimately providing any depth of water necessary to the probable developments of shipping in future?—No difficulty up to, say, 40 or 42 feet of water.

1909. Could you do 45 feet?—Yes, at enormous expense.

1910. Between 42 feet and 45 feet; is that where the great expense would arise?—Yes.

1911. Because of the nature of the bottom?—Yes.

1912. Is the bottom rock?—Yes.

1913. Beyond 42 feet it could only be done at great expense?—Yes.

1914. We have had evidence from which it was freely anticipated that the time would come when great ocean-going ships might be required to draw 45 feet and be 1,000 feet long. But up to 42 feet would there be any great expense?—No.

1915. You can easily provide at a moderate expenditure then for any vessel drawing up to 42 feet or up to 40 feet?—Yes, the scheme is for 40 feet.

1916. You told us it would take 3,000,000*l*.?—Yes, slightly over.

1917. How is that money to be found?—By loan, I presume.

1918. At present you are only spending a tithe of that—300,000*l*.?—It is voted.

1919. And in a certain number of years you will complete the whole scheme?—Yes, but I would not say it will be 300,000*l*. each year.

1920. Can you tell us at all in what period of time you anticipate these improvements will be finished?—Yes. I should say the whole scheme should be completed in under ten years.

1921. If it were completed as you have sketched it that would be sufficient, I suppose, to provide for any shipping which we can at present anticipate would come to this port?—Reasonably anticipate, I think.

1922. Do you find an increasing number of steamers calling here on the road to Australia?—Yes, certainly.

1923. That route seems to be becoming more popular, is it not?—Yes, I think so. Holt's "Blue Funnel" have just started, also the "India" line.

1924. And you have no difficulty in coaling?—No.

1925. Supposing there was a great line of mail steamers running here, you would have no difficulty in coaling and docking them in a moderate time?—That all depends on the draught of the boats.

1926. When your scheme is completed there would be none?—None.

1927. (**Mr. Sinclair.**) The work is carried out by money voted by the Government?—Yes.

1928. Does the increased expenditure from time to time involve increased harbour dues?—I should say no.

1929. The harbour is not looked to to produce revenue which will provide any fixed rate or approximate rate on the expenditure of capital, is it?—I could not very well answer that question, but I do not think it affects the dues—that is the money voted for the construction work.

1930. How is the sum which represents interest on increased expenditure provided, or is it not looked to to be provided at all?—It is not looked to in regard to most of the harbours here.

1931. There is no expectation of revenue being produced that will provide an equivalent to the interest on expenditure?—Not sufficient revenue. I do not think any harbour in the world pays in itself.

1932. The expansion of trade would necessitate improvements, and that in itself would bring in revenue to the country?—Yes.

1933. And that is the only aspect of reproductiveness which is looked at in making these improvements?—Yes.

1934. (**Mr. Garnett.**) You think the number of ships calling here on the way to Australia is increasing?—Yes.

1935. Are they increasing at the expense of the Canal route, or is a natural increase brought about by increased trade between Australia and Europe?—Increased trade.

1936. You are not of opinion that the increase is at the expense of the Canal?—Not to any great extent. The large liners must come this way.

1937. It is a *bonâ fide* increase of trade which probably tells equally on both routes?—Yes.

1938. (**Mr. Bowring.**) Could you tell us about your dry docks?—We have only one. We could take in the "Kildonan." That is about the largest we could accommodate—11,000 tons, I think it is

1939. Have you in contemplation any further development?—Not at Cape Town. I may say that the Government have been in communication with

* Not reproduced.

the Admiralty regarding Simonstown, and I understand that in the case of emergency the Admiralty would be quite prepared to allow boats into their dock at Simonstown.

1940. Those docks are capable of taking very large vessels?—Yes.

1941. How far is it from here?—Twenty miles.

1942. (**Mr. Lorimer.**) I would like to ask you about the tables on the fourth page of this paper.* The capital expenditure at Cape Town is practically the same as at Durban, and yet your interest is about 20 per cent. less. Was it that you were able to borrow at a cheaper rate?—That is really a traffic question.

1943. Could you say anything about maintenance? Durban is about 50 per cent. more than you. Is that because of the dredging necessary?—To a very great extent.

1944. (**Chairman.**) Could you tell us what is the comparative cost of bunker coal here and at Durban?—I understand that the rates are as follows:—*Coaling at Durban.*—f.o.b. and trimmed into bunkers, 15*s.* to 16*s.* per English ton. *Coaling at Cape Town.*—Natal coal f.o.b. and trimmed into bunkers: No. 1 quality, 24*s.* per English ton; No. 2 quality, 26*s.* per English ton; Transvaal coal, 22*s* 11*d.* per English ton.

1945. Does your coal come from the Transvaal?—Yes, by rail.

1946. There is a very low rate down?—Yes.

1947. Can you tell us anything about the comparative quality of the two?—I should say the Transvaal coal is very much more free from sulphur, and the great point is that it does not fire by spontaneous combustion. That is the most important point. You can keep it for twelve or eighteen months. Natal coal is very liable to spontaneous combustion.

1948 I understood there was a scheme for extending the breakwater, but not in a direct line—in a more westerly direction?—A sort of "dog's hind leg"?

1949. Yes.—It was not carried out. It was proposed to make it 1,000 feet straight. This was about ten years ago and there was no money for construction work. The "Titan" crane—probably the best in the world—was not wanted, so it was hired out to Sir John Jackson, and it rebuilt the north pier at Tynemouth. Since then the Admiralty have bought it.

1950. The present scheme does not form part of your big scheme?—No, not the 3,000,000*l.* scheme. I may say we have three dredgers. The big dredger will dredge up to 200 tons an hour. Last year it dredged 125,000 tons.

1951. It delivers 200 tons an hour into the hoppers alongside?—Yes.

1952. (**Sir Jan Langerman.**) In view of the washaways in the past through the north-western gales, how will the extension of the breakwater be affected by those gales?—The extension is solid rock work.

1953. We have had solid work in the past and it has not stood the washaways?—Not solid work; it was rubble.

1954. You anticipate no trouble, then, from the gales?—No.

1955. You have had masonry work washed away?—No, it was rubble.

1956. It was undermined?—Yes, and the blocks have fallen down the slope, which is a very long one—300 feet.

* *See* Appendix, p. 157.

Cape Town, Monday, 2nd March 1914.

Mr. Henry T. L. Leefe, Assistant Manager at Cape Town of the Union-Castle Mail Steamship Company, called and examined.

(*For the evidence of this witness relative to the Mail Contract see p.* 59.)

1957. (**Chairman.**) You represent the Union-Castle Steamship Company?—Yes.

1958. What is your position?—Assistant Manager at Cape Town.

1959. In special charge of what department?—I have had special charge of the coal department, but that was only a part of my work.

1960. We are anxious to hear from you the position of the coal and bunkering business at Cape Town. I would like you to tell the Commission what the actual bunkering conditions at Cape Town are?—For the year 1913, 252,000 tons of coal were bunkered at Cape Town. The bunkering rate for the greater portion of that coal was 26*s.* per ton.

1961. Put on board?—Yes, and trimmed into bunkers—26*s.* That is for the best class of coal, for which the greatest demand exists.

1962. Was that Natal coal?—Yes.

1963. Does the figure of 252,000 include a certain amount of Transvaal coal or not?—That includes a very small proportion. I could not say how much. Certainly under 10,000.

1964. What are the respective prices of Natal and Transvaal coal here?—This year the Transvaal price trimmed into bunkers is 23*s.* 6*d.* and the Natal price 26*s.*, as last year.

1965. And then at that difference of price which kind of coal is preferred by ships?—Natal coal, undoubtedly.

1966. At what difference in price would Transvaal coal be preferred?—That is rather a difficult question to answer, because it is essential that steamers should receive the best class of coal available, and the fact that there has been for the last two years a difference of 2*s.* 6*d.* per ton in favour of Transvaal coal has not been sufficient to command very much sale for it at Cape Town. So the difference must be in excess of 2*s.* 6*d.* a ton.

1967. It has been said that, as compared with Welsh coal, Natal coal is about 7 per cent. inferior in calorific value; is that correct?—I do not know.

1968. The statement was that Natal coal was 7 per cent. worse than Welsh, and Transvaal coal about 7 per cent. worse than Natal?—I should say the difference between the best Natal and Transvaal coal is more like 10 per cent. It is very difficult to say exactly, but all our South African coals vary so much in quality, Natal coals particularly.

1969. Can you tell the Commission what the price both of Natal and Transvaal coal has been at Cape Town during the last five years?—The Cape Town and Natal prices of coal have been:—

1910—26*s.* 6*d.* 1911—23*s.* 6*d.* 1912—24*s.*
1913—26*s.* 1914—26*s.* That is Natal coal. As regards Transvaal coal, the price last year was 24*s.*, and that was the first year in which the Transvaal coal has been quoted for bunkers in quantities at Cape Town. The old railage rate on Transvaal coal placed it quite out of the market.

1970. When did the new cheaper railway rate come into force?—October of last year.

1971. What is the lowest price at which Natal coal has been quoted in Cape Town?—You mean for bunkers? The last five years 23*s.* 6*d.* was the lowest, and I am almost certain it is the lowest that has ever been quoted.

1972. It is now half-a-crown dearer than that?—Yes.

1973. Can you give us the reasons for the rise?—Yes, the increased cost of coal at pit head and occasionally the increased cost of chartering explains why the rate has been variable from year to year.

1974. What is the railway rate from the pit head to Durban?—On ordinary coal exported to Cape Town?

1975. Yes,—6*s*. 8*d*. per ton. The export of coal is subject to a special export rebate of 1*s*. 1*d*. per ton. I am referring to Imperial tons of 2,240 lbs.

1976. Now what is the actual railage?—The actual railage may, therefore, be accepted as 5*s*. 7*d*. on bunker coal.

1977. That is for a haul of how many miles?—241 miles.

1978. That gives a rate of how much per mile?—One third of a penny per mile from Hatting Spruit to Durban.

1979. Is that owing to the high passes—the heavy gradients?—It is downhill, of course. It is downhill from the mines to Durban; the difficult haulage is back again to the mines.

1980. I thought the line went over two high passes?—That may be: I rather think there is a rise.

1981. You do not speak from technical knowledge of the railway difficulty?—No, I do not.

1982. Then I have been reading the report of the Select Committee on Railways and Harbours, and I see that the complaint was made that the Natal coal was dearer in Cape Town than in Karachi. The examination was conducted from the point of view of the desirability of cheap bunkering of coal in Cape Town, and the complaint was made that bunker coal cost ships more here than at the far more distant point of Karachi?—I am not acquainted with that, but I should doubt it.

1983. Does a large amount of Natal coal go to Karachi?—A large amount every year.

1984. I am quoting now from the evidence given before the Select Committee on Railways and Harbours. The question was: "What is the price of Natal coal to-day?" Answer: "26*s*." And then again—"It costs more at Cape Town docks than in Karachi"?—I very much doubt that, because freights last year were unusually high, and it was difficult to obtain steamers on short charter, and on the face of it, it hardly seems possible.

1985. Then it was further asserted in evidence before this Committee that prices of bunker coal here at Cape Town had been advanced owing to the establishment of a monopoly agreement between the producers or transporters; what can you tell us about that?—I should like to say in the first place that we were not asked to submit any evidence on that point to the Select Committee. I may explain that Mr. McLean, the General Manager of the Company here, appeared as a witness during the earlier sittings of the Select Committee, and he was not asked a single question in regard to the Cape Town coal trade. Subsequently, and without any knowledge on our part, certain old competitors of ours, who, I have no doubt, gave their evidence in perfect good faith, gave evidence, but we were not aware of this until almost the close of the Committee. As soon as we heard the nature of the evidence submitted we requested that we should be heard in reply, but Mr. Burton, the Chairman of the Committee, replied that the Committee had practically completed its labours and it was too late to give evidence, so that all the evidence which appears in the report of the Select Committee is subject to correction from our point of view, and we do not admit anything in the nature of a monopoly, and we are further prepared to prove, if it is necessary to do so, that most of the evidence given was of a most misleading description.

1986. I do not think we need go into details about the controversy, but anything of a general nature that you can tell us will be welcome?—On the question of a monopoly, it was clearly stated that we had entered into a combination with the collieries in Natal with the object of raising prices of coal. Now, may I say in the first place, that that statement is absolutely void of truth? A combination of collieries in Natal certainly did take place. The Union-Castle Company is the largest individual purchaser of Natal coal. For our own protection, therefore, and our own bunkering requirements in this country, we had to take some action. We need something in excess of 300,000 tons a year on the coast. When we learned that a certain number of the collieries had formed themselves into a combine, we were greatly afraid that the object would be to put up the price of coal, and in order to protect ourselves, Sir Owen Philipps, the Chairman of the Company, entered the market and secured an interest in two of the collieries, and the position then between ourselves and the other owners was really one of warfare. So far from raising prices it was the other way, because, while we might sell 25,000 tons at Cape Town as bunkering merchants, on the other hand, our consumption—in our own steamers—was over that quantity. So that on the face of it, whatever the object of the combination was, it could not have been the raising of prices. And then, so far from having a monopoly, I may say we entered into this arrangement with eight collieries to purchase nearly 700,000 tons of coal. There was naturally a good deal of friction between ourselves and the associated collieries when they discovered we had secured an interest in two collieries, and they demanded that we should purchase 200,000 tons of coal for 1913 in excess of our actual requirements, and, as a matter of fact, we did enter into that agreement for 700,000 tons, although we knew that we could not dispose of more than about 500,000 tons of coal in South Africa. In return for the purchase of an excessive amount of coal, we became their sole selling agents as far as the Cape ports were concerned—that is to say, they undertook that they would not sell coal at any coast ports except they passed their orders to us. This was to enable us to get rid of this enormous amount of surplus coal, and it constitutes the claim that we were in the position of great monopolists, and that we took advantage of our position to force up bunkering rates. Now it is true that the mines entering the combine produce a very large amount of coal. The total output for 1913 of Natal mines was 2,600,000 tons. The associated collieries produced 1,450,000 tons. The two collieries in which we had secured an interest produced 350,000 tons of coal last year, so that there was a balance of 800,000 tons produced by collieries outside the combination, which coal was available for purchase at any of the coast ports in this country, and with such a large quantity of coal in the market it cannot be said that we were in the position of monopolists. In any case we were appointed sole selling agents for the associated collieries, which was a very fair concession to make to us in view of the excessive amount of coal we contracted to buy. I may say that there was a considerable amount of trouble in getting coal during 1913 owing to strikes and labour troubles and other reasons. Our actual purchases only amounted to 518,000 tons instead of 700,000 tons, and the mines let us off the other balance because they could not deliver owing to the strikes and industrial trouble.

1987. Is there anything in the nature of a monopoly for the transport of coal from Durban to Cape Town, I mean sea transport?—None whatever. We were always in competition with another colliery. The South African collieries, which are controlled by De Beers at Kimberley, have a colliery of their own, and they also have a collier of their own, and this has always been running down the coast in opposition to us as regards the Cape Town bunkering trade.

1988. Is the colliery in the Dundee district?—It is in the Hatting Spruit district. I believe it is suggested in this evidence that we had working arrangements with the South African collieries, but so far as the bunkering trade is concerned it is not true.

1989. You said just now that the total amount of bunkering done in Cape Town in 1913 was 252,000 tons of coal?—Yes.

1990. Of which you did how much?—Including our own steamers we did 225,000 tons

1991. And excluding your own steamers?—We bunkered to outside steamers 191,000 tons.

1992. You did 191,000 tons as compared with 252,000?—Our competitors did 27,000 tons.

1993. And the balance is Transvaal coal, is it?—This includes a certain amount of Transvaal coal, but not very much. The balance is coal supplied to our own steamers. We bunkered steamers outside our own 191,000 tons, and we bunkered our own steamers 34,000 tons.

1994. Has the bunkering business at Cape Town developed rapidly of late years?—Yes. Of course, we are no longer in the bunkering trade. We withdrew from it at the end of last year. We found it was not sufficiently profitable for us to justify us in encountering the criticisms to which we were subjected. And that fact alone, I think, is in itself a sufficient answer to the question as to whether we were monopolists.

1995. This trade is now in the hands of whom?—Two or three firms. Mitchell Cotts & Co. are perhaps doing the bulk of the business, and Parry Leon & Co., who act for the Mutual Bunkering Company, consisting of Bucknall's, and Ellerman's, and the White Star line of steamers.

1996. So that a large number of firms are now in competition in this business?—Well, not a large number. I dare say four or five altogether.

1997. Is the competition from the Transvaal actually increasing or not?—Yes, it is.

1998. Can you give us any figures?—I am afraid not, because we are now out of the trade, and really serious Transvaal competition only commenced from January of this year. Last year, although the rates were reduced in October, shipowners had entered into their contracts for the year and could not take advantage of the rate. But this year, I believe, larger quantities are being brought down from the Transvaal.

1999. Then as regards the bunkering contracts. They are made for the year, I suppose?—Yes.

2000. And fixed up in December?—Well, towards the end of November, because the contracts with the collieries have to be entered into some time before.

2001. Who makes the contract? Is it the local firm here which contracts with a line like Ellerman's, or the White Star line, or the Blue Funnel line?—So far as the Union-Castle Company was concerned, Mitchell Cotts & Co. secured the bulk of our business on commission and they themselves entered into their own contracts.

2002. They contracted with you to buy the coal and they contracted with other lines to supply bunker coal at a given rate throughout the year. Is that it?—Yes.

2003. You have told us the current prices for bunkering coal at Cape Town; can you give us the corresponding prices at Durban?—Yes, for the years 1910 to 1914. For 1910 it was 14*s.* 6*d.*, for 1911 14*s.* 6*d.*, for 1912 14*s.* 9*d.*, for 1913 16*s.* 6*d.*, for 1914 17*s.*

2004. You have then a price of 17*s.* at Durban comparing with 26*s.* here?—Yes.

2005. There is a difference of 9*s.*?—Yes. I am only dealing with the best class of coal all through.

2006. What is the current rate of freights between the two ports?—7*s.* a ton.

2007. What are the coaling facilities of the port of Cape Town here?—Well, I am afraid they are not quite sufficient to meet the actual requirements of the trade; they are behind Natal, for instance, in coaling appliances.

2008. We would like you to give that in some detail?—Well, in discharging coal, for instance. It is discharged by the use of transporters and iron buckets containing from 1 to 1½ tons.

2009. Discharged from the railway trucks or from the ships?—From the collier into the railway truck or store. But it is in connection with the bunkering that great improvement should be made, I think. Unless the steamer lies alongside a wharf containing transporters or cranes, the coal has to be carried on to the ship by hand, and even from the waterside the coaling arrangements are very primitive. Coal is raised in baskets from the lighters on the water side of the steamer by means of the ship's gear and dealt with by hand. It is a slow and cumbrous process. I have no doubt that the harbour officials will see the necessity of improving it. Indeed, in connection with the 100-ton floating crane for Cape Town docks, I understand it is intended to use this crane in connection with bunkering of steamers from the water side, and this should enable the work to be done considerably quicker than it is at the present time.

2010. I understand that the coaling appliances on the quay-side are inadequate?—With regard to coaling appliances on the quay-side of our long south arm there is no crane. The coaling is done by hand.

2011. What loss of time does it involve as compared with the more modern arrangements?—I am afraid I cannot answer that question, except that all up-to-date bunkering ports in the world have machinery which does the work faster than by hand.

2012. Have you made representations to the harbour authorities?—Oh, yes, and I believe that they have been seriously considering the advisability of increasing the coaling facilities.

2013. Are there many complaints by passing steamers as to the inadequacy of the coaling arrangements here?—Not at Cape Town, I think, because, as a rule, the steamers have been freely supplied at Cape Town. In fact, up to the end of last year I do not think any steamer was ever kept waiting for coal. It frequently happens that at Durban, singular though it may seem, owing to labour troubles and the inadequacy of trucks, steamers are continually kept waiting for coal, but here at Cape Town up to the end of last year there has been no waiting. This year it has not been quite so, because during the late railway strike coal was unobtainable from our South African sources, but I think this port has an excellent name as a bunkering port, and the Australian ships, I think, appreciate that fact.

2014. Can you give us any figures bearing upon the increase in the number of Australian ships calling here either on the outward or homeward journey?—No, but I think they have increased very considerably.

2015. And you cannot say whether this route is gaining favour as compared with the Suez Canal route?—I should say that 60 or 70 per cent. of the Australian trade goes *viâ* the Cape.

2016. That is outward?—Yes, that must be a higher proportion than some years ago, but I am not in possession of the actual figures.

2017. Who would be competent to give us that information?—I do not know whether the local agents of the Australian line would be in that position.

2018. **(Sir Alfred Bateman.)** Is there not a Registrar of Shipping here?—No, but there is a Shipping Master. The Customs department may have records.

2019. **(Chairman.)** You will probably agree that in the interests of South Africa it is highly desirable to encourage the Australian trade passing this way in preference to other routes?—Oh, yes, quite.

2020. And one of the most important considerations would be facilities for speedy and cheap bunkering?—Yes.

2021. What can you suggest as likely to conduce to these objects?—In the first place, I doubt whether the variation of the bunkering rate from 26*s.* to 28*s.* would make any difference as regards steamers calling at Cape Town. I do not think a difference of 2*s.* a ton would influence a single ship to go to Durban in preference to Cape Town. I do not think the price of bunkers here, within limits, is a factor in inducing steamers to coal at Cape Town.

2022. Surely the price of bunker coal must be one of the considerations?—I do not think so, when the alternative is to deviate to Durban.

2023. Can you tell us the proportions that bunker here and that bunker at Durban?—Outwards? I doubt whether very many do. The bulk of the outward steamers bunker at Cape Town.

2024. And the homeward at Durban?—Yes, because they call there for cargo and passenger purposes.

2025. Is there nothing you can suggest in the interests of South Africa and the Empire generally which will improve the conditions affecting the Cape route?—I suppose the question of deepening the harbour is very important. The increase in the size of steamers and particularly their draught must to a considerable extent depend upon the deepening of quays in the ports of South Africa.

2026. I suppose that deepening affects the Union-Castle boats as well as the Australian ones?—Yes.

2027. Are you hampered or limited by the depth now obtaining?—No, not at present, but I should prefer

that my answers be confined to the coal matters. I am under instructions from the head office.

2028. **(Sir Rider Haggard.)** I suppose there would be no difficulty in bringing the facilities of Cape Town up to the higher standard, would there?—No difficulty at all as far as I know. It is merely a matter of expense.

2029. Is there any prospect of the difference between the price of coal at Durban and Cape Town being decreased in favour of this port?—I doubt it, unless the railways are prepared to further reduce their rates.

2030. Are the rates high?—No, they are unusually low. The railway carries from the Transvaal, and it also applies to Natal coal, five or six tons of coal for one penny a mile.

2031. **(Chairman.)** That is one-fifth or one-sixth of a penny per mile?—Yes.

2032. **(Sir Rider Haggard.)** How does it compare with the ordinary rates of coal?—I do not know. It is a fighting rate.

2033. Not a payable rate?—I doubt it.

2034. What are they fighting?—What they considered to be, on the evidence submitted to them, an unfair combination between the Natal Collieries and the Union-Castle Company.

2035. There is no prospect that that rate will be further lowered?—I do not think so.

2036. **(Sir Alfred Bateman.)** You refer to the rate of 5*s.* 7*d.* for 241 miles from the colliery to Durban?—Yes.

2037. The inland coal rates for the same distance on coal consumed in Durban are about 11*s.* 1*d.*?—Yes. You will hear all about that grievance at Natal. The underlying principal, of course, is to attract steamers to Natal for bunkering and also to increase the export trade in Natal coal, and for that purpose they give an unusually low rate of 6*s.* 8*d.*, less 1*s.* 1*d.* for export rebate, but even that rate is proportionately twice as high as to Cape Town. I mean the bunkering rate of 5*s.* 7*d.* on coal from the mines to Durban, viz., one third of a penny per ton per mile is twice as high as the rate between Natal mines and Cape Town—viz., one-sixth of a penny per ton per mile.

2038. The through rate?—Yes.

2039. **(Chairman.)** Is it 5*s.* 7*d.*?—The railway rate is 6*s* 8*d.* subject to a rebate of 1*s.* 1*d.*

2040. **(Sir Alfred Bateman.)** So it comes to this that the coal consumers have to pay for the other coal being exported cheaply?—Yes, there is very serious discontent in Natal on that very point. But the defence of the Government is that they want to attract steamers to South African ports for bunkering purposes.

2041. And this is done by the Railway and Harbour Board?—Yes.

2042. How were you able to engage in these undertakings? Is it in your Articles of Association that you may own collieries and deal in coal?—As a matter of fact it is not an ordinary part of a steamship business, and it was not altogether willingly that we entered into the arrangement. We were induced to enter in order to protect our own interests as large coal consumers. That was one of the inducements in 1907 when we commenced acting as coal merchants. We did it in order to protect our interests and we did it somewhat grudgingly and the business grew until it became a large business.

2043. Were you not liable to an action for pursuing objects which were not in your Articles?—Surely it is open to a steamship company to enter into any trade it likes.

2044. Are you not a public company, and could you do that in England?—I think so, it depends on the Articles of Association. It has been done by other companies, especially on the West Coast of Africa. We were rather forced into it to limit the price we should be obliged to pay for our own bunkers. We are the largest individual consumers of coal in the country.

2045. This is all over now and you have no present intention of re-entering the business?—We have no present intention.

2046. You do not know of anything likely to affect those extraordinary rates?—No, I do not think I can suggest how they should be reduced.

Cape Town, Tuesday, 3rd March 1914.

Mr. F. COOK, Managing Director of F. Cook Company, Limited, called and examined.

2047. **(Chairman.)** You are Managing Director of the firm, F. Cook Co., Ltd., coal contractors and machinery importers of Cape Town?—Yes.

The witness submitted the following statement:—

Coaling at Cape Town: its past, present, and possible future.

I am the managing director of F. Cook Company, Ltd., coal contractors and machinery importers, of Cape Town.

About the year 1901 I saw there was a prospect to do a trade at this port in Welsh coal, and thereupon imported a cargo of 5,000 tons. This I disposed of before its arrival, and continued to bring out more cargoes, having in the meantime secured the Admiralty contract as well as contracts for the German and other Navies, very little coal of any description being taken at this time by ordinary steamers except by the Union-Castle Company boats, who at this time coaled extensively at this port with Welsh coal brought out by themselves in tramp steamers.

A few years after this small parcels of Natal coal were brought down here for trial, but failed to find a ready market. The first real help, however, it received was by the Cape Government Railways dropping Welsh coal for their requirements. The prejudice against its use, however, died hard; little or no bunker trade was done at Cape Town, as the excessive charges for handling killed any prospects of selling at a price tempting enough to induce the cargo boats from England to take coal at this port. We however chartered a steamer and sold Natal coal from East London to German S.W. ports. The charges at the Cape ports and the delays at the German ports left us generally with a loss, while at this time there entered into competition with us several steamship companies either selling Natal or Scotch coal. The feeling was so much against Natal coal in the Cape and German S.W. ports that after delivery we have had the coal thrown on our hands and had to accept the buyer's offer to take it away.

We continued to stick to the Natal coal, confident there was a great future for it and well knowing that the complaints were mostly unjust. Cape Town, however, was greatly handicapped by the antiquated way in which coal was handled and the prohibitive charges made for any service rendered. The charges to land a ton of coal and re-ship it for bunkers was as follows:—

	s.	*d.*
Landing and dock dues	1	3
Use of bags	1	0
Cartage to storage site	2	6
Storage, say	0	6
Filling bags and loading in wagons and delivering to ship	3	6
Trimming in ship	1	0
Per 2,000 lbs.	9	9

(This work is now performed by the present Administration for 2*s.* per 2,240 lbs. as against 9*s.* 9*d.* for 2,000 lbs.)

So you can see that to try and do a bunker trade one had to overcome many obstacles. Prejudice to the coal was gradually overcome, excessive charges and old-fashioned methods of handling gradually disappeared, and in every reduction made by the Government the corresponding amount was allowed to local buyers and ships. At this time many firms and agents as well as shipping companies were in competition, and the chance of a fair profit was remote and so many retired from the contest; one shipping company, however, remained in the trade, and with ourselves did practically the whole of the bunker trade, it having increased from a few hundred of tons to 130,000, tons per annum. This continued to increase till about three years ago it had reached 380,000, and every prospect of going on the same rate of increase if the methods were continued.

Railway strikes in Natal and Australia affected the coal trade and caused losses in several ways, and Transvaal coal being then introduced for the first time by steamer from Delagoa Bay. The railage from the Transvaal being prohibitive, Natal coal, now having entirely ousted the imported article owing to the railways, after Union, giving it the most favourable terms and facilities, had the entire Cape trade at its feet, but, unfortunately for Natal, they have always resented the Cape's bid to become a bunkering port and could never see that the trade we at this port were doing was captured from the islands and supplied to steamers bound for Australia and New Zealand who would never go so far out of their way as Durban. This feeling continues to this day, and considering that local people did the pioneer work, taking all risks in buying for cash their coal, their action is a very poor one in return for such enterprise.

Two years ago a shipping company took a more prominent part in the coal trade, and, I believe, purchased one colliery and secured the controlling influence in two of the largest Natal collieries, and were then able to dictate terms to all the other collieries who were worth considering, with the exception of two others, bound by their contracts to the Government, who could not actively take part in the combine then formed. The collieries were then bound to sell only to the shipping company for any Cape port, India, or Mauritius. This naturally hit several coal brokers in Durban and elsewhere, and as we ourselves could not purchase coal as in past years, we retired from the trade for the time being.

An appeal was then made by us to the Government, and an enquiry held which disclosed the fact that the price of Natal coal for bunkers had suddenly gone up 4*s.* to 6*s.* per ton, and this port's trade was endangered thereby. The only hope was a cheap overland rate from both Natal and the Transvaal collieries, and this allowed the vast coal mines of the Transvaal to find an additional outlet, and although under normal circumstances Transvaal coal cannot compete with the Natal article, the present conditions are about equal. Coal, however, is still too dear at Cape Town, but could only be cheapened by one or more collieries in Natal having their own depôt here and selling at a reasonable pit mouth price plus freight and other charges. This possibility was placed before all the collieries in Natal two years and more ago by a very lucid memorandum and personal explanation, but the combine and a rise in price was the response.

Our last two years' trading in coal brought a profit of about 100 per cent. on the capital after the deductions of many commissions to brokers, agents, &c. Coal was then the lowest it had ever been—20*s.* to 22*s.* 11*d.*—and it is quite possible to again sell at these figures.

Under the system of coaling done here by the Government, who handle all the coal from the arrival of the merchant's steamer till it is sold and put aboard the steamer calling for bunkers, satisfaction is given to steamship companies, who may be sure of getting their full weight, and there are very few places where quicker work can be carried out, while the kaffir labour used is equal to the best in the world.

Government, by their action, have made the bunker trade, and should continue to see that the port does not lose its good name.

Natal coal is more varied in its qualities than the Transvaal article, and in no part of the world is there such a difference in so close an area. Some of the Natal coals are very liable to spontaneous combustion, and heating has taken place when the coal is wet after four days on ship to such an extent that men could not stand on it without boots, while storage in heaps or hulks has always resulted in heating or fire. It is only fair to state that this fault is entirely absent in many Natal coals.

Natal coal for bunkers is too cheap in Durban, and one could wish they were far-seeing enough to combine and sell their own products in Cape Town as well as Durban at a more uniform rate; they would double their sales in Cape Town and increase their profits at Durban. If I were controlling the interests of Natal collieries I should let Durban look after itself and concentrate all my energies on capturing the Cape Town business.

The Transvaal has a Coal Owners' Association, which, unlike the Natal combine, do not confine their business to practically one buyer, who spoils their market but sells at a price far lower than it need do, and are out to do the trade. We have never done business with Transvaal coal, except during the strike in Natal, having constantly pushed the Natal article. Transvaal coal is very even in its qualities and is an exceptionally easy coal to fire, with very little clinker, and for this reason firemen using it after Natal coal prefer the former.

The cheaper railway rate has given it a chance and it has kept the bunker trade open for Cape Town, which, prior to its arrival on the scene, seemed doomed.

Cheap coal is the making of any port in the position of Durban and Cape Town, most steamers only being able to call at one in the outward or homeward journey, so that neither captures the trade of the other.

Storage bins are needed in Cape Town for bunkering direct into steamers or into lighters, as the present handling will be a loss to the Government, although the bunkering must be retained at any cost.

Despite what is said to the contrary at Durban, Cape Town must, if properly developed, become a coaling port, and the bigger the ships are built the less likely are they to go further afield for their coal. The bunker coal comes here by rail or water from the producing areas of Natal and Transvaal, and there should exist no jealous feeling against Cape Town for the good work she is endeavouring to do, but, as I said before, let the Natal collieries have their own depôt here and sell their own coal

2048. (*Chairman.*) What amount of business do you do in the bunkering trade here?—Not very much now, but until three years ago we did the bulk of the bunkering business.

2049. Why has your proportion diminished?—We were running steamers to Natal, our trade continually increased, and we had larger steamers each year, but three years ago we were unable to purchase coal from the same colliery as before on account of arrangements being made with another firm to take their supplies, and we could only purchase through that other company, which meant, of course, we had to pay the same price as they were selling to others; we would be selling coal at the same price we gave for it. We had, therefore, to retire from the bunkering trade for the time being.

2050. What are you doing now?—A small amount of overland trade, and nothing in the bunkering trade.

2051. Is it Transvaal coal?—Some of it is Transvaal. We get it overland for various industries.

2052. You have been completely cut out of the bunkering trade?—Yes.

2053. Why have you been cut out?—There was a combination formed among the Natal collieries, and they agreed to sell to one firm only for the Cape ports, and the people we had been dealing with for many

years could not supply us, so we had to go out of the trade.

2054. When you were in the trade you could deliver bunker coals at what price?—21*s.* 6*d.* to 22*s.* 6*d.*

2055. What is the price now?—The price now is 24*s.* and 26*s.* Of course, when it was in the hands of one firm the price was put up, although there was a reduction of 1*s.* per ton on export coal allowed by the railways on all coal exported from Durban.

2056. Have you gone into the bunkering trade with Transvaal coal?—No; because we have always pushed Natal coal, and at that time it was impossible to deal with Transvaal coal because the railage was so high. There was an inquiry held in regard to this question last year by the Government, and they then reduced the railage both of Natal and Transvaal coal.

2057. What are the rates now on Natal and Transvaal coal?—I cannot give you the figures at Cape Town, because we cannot bring coal to Cape Town from Natal. They would not deliver anywhere nearer than Paarl, and I understand they were not allowed to do so, so we have not brought Natal coal overland to the coast.

2058. In your memorandum you state that it is of great importance to Cape Town to have cheap bunkering coal in adequate quantities?—Yes, since the Government reduced the excessive rates which they used to charge, it enabled us to sell coal so low that ships called here which never called before. Instead of taking Welsh coal at the Islands they would come here and take 1,000 tons and upwards, and the trade went up by leaps and bounds.

2059. When was that?—That commenced about four or five years ago. There was a great prejudice against Natal coal at first. You could not sell a hundred tons to ships unless they were short. We have had to take it to German South-West Africa.

2060. Do you consider the present condition of affairs satisfactory?—No, I do not.

2061. Unsatisfactory for what reason?—I think it is unsatisfactory purely on account of the present price and because there is not a free trade done in Natal coal.

2062. What you object to is the combination between the Natal collieries?—Yes.

2063. Do you object to anything else?—I do not object, so far as the combination goes, if they will only sell to any buyer the same as the Transvaal Coal Owners' Association.

2064. You do not object to the combination, provided it fixes a minimum price?—No, I think it is rather a good thing.

2065. You object to it being dealt with only by one agent?—Yes.

2066. Now as regards the competition between Transvaal and Natal coal—what have you to say?—I think that as prices are between the two coals, it is more or less about equal because we look upon Natal coal as being a little superior to Transvaal coal.

2067. How much superior?—It has been stated about 12 per cent., but I would not say it was, because it has been used very considerably down here, and they are beginning to like it. There is not so much clinker about it, and it is cleaner burning. We use Transvaal coal on two whalers which we have, and we find it satisfactory, but if the Natal collieries were to have their own depôt here and sell coal cheaply, then I do not think that the Transvaal coal would have much show, because they could afford to sell coal here at 21*s.* and make a good profit.

2068. How do you arrive at that?—We used to sell coal at 21*s.* 6*d.*, and there were several rebates off it which left us in many cases 1*l.* a ton, and still we came off with a good profit. That was the last two years that we were in the trade and were keeping our steamers fully employed. We had delays on account of strikes, but if you took the average we could sell coal at 21*s.* and still leave a good margin of profit.

2069. Now give the Commission the details of the 21*s.*?—If you take the pit's mouth price, that is 7*s.*, then there is 6*s.* 8*d.* for railage to the points.

2070. Is that f.o.b.?—No, that is f.a.s. Putting on board and the charge for trimming, which is done by the Government, means another 7½*d.* per ton. That gives you 14*s.* 5½*d.* Now, if you export that coal to any of the Cape ports, or to any other ports, they allow you 1*s.* rebate from the railage, which brings it down to 13*s.* 5½*d.*

2071. We were told that it was a little over 1*s.*?—Yes, I think it is 1*s.* 1*d.*

2072. **(Sir Alfred Bateman.)** It is 5*s.* 1*d.* for 241 miles by rail to Durban, is it not?—Well, we reckon 6*s.* 8*d.*, with 1*s.* 1*d.* off.

2073. **(Chairman.)** 1*s.* 1*d.* off brings the cost to 13*s.* 5½*d.*?—Yes. As soon as you bring the coal to these docks the Government takes charge of it. You discharge the coal yourself and we act as our own stevedores. We put the coal into lighters which are the property of the Government, or into the railway trucks, also the property of the Government, or into bags, also the property of the Government, and the coal is then taken away and weighed, and they render us an account of what we have in the lighters and in the trucks. For that service, putting it on board ship and trimming it into bunkers, the charge is 2*s.* per 2,240 lbs.

2074. That includes storage?—Yes.

2075. For an indefinite period?—Yes. You would work your whole stock out in a month's time or less.

2076. They take delivery of that where—on board your vessel?—No; on the quay. We pay for the cranes for discharging it and they receive it and give us a return of weights. When bunkering a steamer they sort the trucks out and the quantity required and put it alongside, put it on board, and give us railway receipts. The whole of that service is done for 2*s.* That brings it to 15*s.* 5½*d.* Well now, if you put the freight at 5*s.* per ton, which includes discharging but not loading, from Durban to Cape Town at 5*s.* a ton, I think it is a very fair margin, because I know what it cost us when we were running a boat called the "Tiger." That brings it to 20*s.* 5½*d.*, or taking off the extra 1*d.* you may say 20*s.* 4½*d.* Well, you can sell that coal for 21*s.* 6*d.*, or say 21*s.* These figures are all outside figures. No doubt, if you are keen, you can save on various charges, such as the purchase of the coal, for instance. I have put these figures high, but the other figures are actual. Now that coal to-day is sold at 26*s.*

2077. The difference between your 21*s.* 6*d.* and 26*s.* is extra profit to whom?—To the monopolists.

2078. Do you mean the Natal Association?—No, they only sell and bind themselves to the other company. That monopoly or combination is quite all right so long as the man who has the money can buy what he requires.

2079. We were told yesterday that the Union-Castle Company is out of the business?—I believe they went out at the end of last year and gave the boat over to another company, but I think the same conditions still exist. I am not behind the scenes and I only know from what can be seen on the surface, but they certainly had a monopoly at one time and nobody could purchase coal for any of the Cape ports. I believe they purchased a controlling interest in two of the collieries in Natal and also purchased the Hatting Spruit Collieries, and naturally the other collieries fell in with this combination. Now I reckon that if the Natal coalowners want to get the business here they must combine amongst themselves and have their own depôt here. It would relieve the congestion of trucks in Durban also. They could sell their coal here very well if they were content with the cost of freight and charges plus their ordinary selling charges. They could sell coal here, leaving a good margin of profit, at 21*s.*

2080. That allows them 7*s.* at the pit head?—Yes, and I maintain that 5*s.* is too high for freight between here and Durban.

2081. Do you speak from your own experience?—Yes.

2082. What would it cost you to do it?—I cannot give you the actual figures. We had to go into

liquidation ourselves. It was rather a pity because we made 100 per cent. the first year and the second year 16*s.* 5*d.* on every 1*l.* share. Our capital was 10,000*l.*, but we only subscribed 5,000*l.*, as that was all the capital necessary to run the steamers, but we made that profit by our enterprise after all commissions were paid. We paid a little over 1,000*l.* per month for a steamer carrying a little over 5,000 tons. She could do two trips a month from Durban to Cape Town.

2083. What has happened to the "Tiger": have you sold her?—No, we only chartered her. The Union-Castle Company took her up after we went out of the business, and I believe another company has taken the boat over from them. She is a Norwegian boat.

2084. You allow a difference between 21*s.* 6*d.* and 7*s.*, that is 14*s.* 6*d.* for getting the coal from pithead into bunkers, trimmed on board at Cape Town?—Yes, 14*s.* 5½*d.*, but with the 1*d.* difference it is 14*s.* 4½*d.*

2085. How would that rate compare with the rate from Natal by rail?—I could not give you the figures to Cape Town because we have nothing brought into Cape Town.

2086. Assuming there was no agreement which prevented them, how would the railway rate compare?—I think it would be somewhere about the same figure.

2087. You have no experience of Transvaal coal?—I have used it, but I have never done any business in Transvaal coal.

2088. In the current year what do you estimate the proportions of Natal and Cape Town coal for bunkering?—From what I can gather, which may not be accurate, I should say over one-third used would be Transvaal coal and I should say that next year it will be quite half and will increase in future.

2089. What is the total amount per annum approximately in tons?—When we finished off we had, between the two firms, sold, I think, 380,000 tons and that was worked up from 10,000 when we started. It has gradually increased because the charges were reduced by the Government for handling coal.

2090. In your memorandum you say that Natal coal is very liable to spontaneous combustion and heating?—Yes.

2091. Is Transvaal coal superior to Natal coal in that respect?—Yes. I do not know of a case where Transvaal coal has heated. We had only one cargo down from Delagoa Bay during the strike, but there were no signs of heating. We have had cargoes from Natal that you could not stand on. It has been smoking after only four days and we have had several bad fires on hulks where we have stored it and in heaps on the shore.

2092. You say firemen prefer Transvaal coal because it is cleaner to handle?—Yes, they can clean the fires much easier.

2093. What are the disadvantage as compared with Natal coal?—I do not think that the calorific value is quite as good. It is a little dirtier, but it is better than a good many of the cheaper Natal coals. It is a good coal and I do not wish to use anything else. Certainly at the present time I would not use Natal coal at the present price.

2094. **(Sir Alfred Bateman.)** Who is this mysterious company which does the business now?—The Union-Castle Company.

2095. But they are out of it?—They may be out of it now, but they were not in reference to the time I mentioned when we had to give up business.

2096. At the present time?—I do not think so. I do not say they are taking contracts this year, but I understand they sent a circular letter recommending people to take coal from another company which had been working with them for many years.

2097. This other company has now the monopoly you say?—I should say so.

2098. Do you know?—No. I only go from what I can see and what is generally stated in the trade.

2099. You have shown us very clearly that the coal which comes from Durban by sea is now at a rather high price, but I do not quite understand what this 1*s.* rebate is for?—The 1*s.* rebate is given by the Government as an inducement to the export trade.

2100. In the figures I have the rate is 5*s.* 7*d.* per ton from Hatting Spruit Colliery, 240 miles from Durban, that is 6*s.* 8*d.*, minus 1*s.* 1*d.*?—Yes.

2101. Is that the 1*s.* 1*d.* you speak of?—Yes.

2102. Because even at 6*s.* 8*d.* it is very much lower than the rail charge for coal for consumption in the Union, which is about 9*s.* to 10*s.*?—Yes, there is a great preference given to the export trade. I do not know that it is altogether right, especially in the case of Cape Town. It does not seem fair, because the factories in Durban should be entitled to a lower price for coal as well as Cape Town. But we do not get it here in Cape Town, the intermediate man takes it. I mean to say it is no advantage if it is in the hand of one firm.

2103. You cannot go into the market and buy coal at Cape Town for anything like 21*s.*?—No.

2104. You must get it from this company, which has a monopoly and charges 26*s.*?—Yes.

2105. I suppose for consumption it would not be 26*s.*, would it?—Some of that charge is for putting it on board, that is 2*s.* I think you pay 1*s.* dock dues and other charges, so it is more for local consumption.

2106. It would bring the figure from 26*s.* to 27*s.*?—Yes, more than that. For delivery in the 1¼-mile radius it is 2*s.* 6*d.* a ton, and the seller has to provide his own bags for delivery outside the dock gates.

2107. You mean to say that the factories in Cape Town pay more than 26*s.*?—Yes, there is 2*s.* 6*d.* extra for delivery of a short ton, and then there are dock dues and *ad valorem*, 1*s.* 3*d.* Then there is off-loading into the customers' store and bags, about 1*s.* On the other hand the Harbour Board puts you on board a long ton for 2*s.*, and they will handle it and store it for you. They give preference to bunkering, they have done all they can for bunkering and it is really due to the action of the Government that bunkering has increased in this port.

2108. Meanwhile the consumer in the big factory has no favour shown to him?—No. The best thing is to buy Transvaal coal overland.

2109. Which is brought down by rail at what price?—I cannot give you the figures, we only buy it for our ships, we do not deal in it. All through these years we have consistently stocked Natal coal, and have never attempted to act as agents for any Transvaal coal, and we have no opportunity of dealing in the coal at present. We only have the opportunity of going back into the Natal coal trade, and bringing it down by steamer to Cape Town when it is free to purchase.

2110. You cannot purchase it now?—No.

2111. Would you charter a boat?—No, because we cannot get a cargo. I hope we shall some time, but at present we are right out of it, and we used to do the bulk of the bunkering business for years.

2112. Your complaint is that the bunkering price is too high?—Yes.

2113. And for consumption in factories in Cape Town it is still higher?—Yes, because there are extra charges that you do not have to pay for bunkering. Bunkering is done on shore at a loss, they cannot do it for 2*s.*

2114–5. But there is a big margin for you if you charge 26*s.*?—The Government does the work and the Government is losing money. It is the merchant who is making the profit. I know the Union-Castle Company are not dealing in coal now, but I do not think that they are altogether disinterested.

2116. **(Mr. Campbell.)** Which is the port which is mostly used by boats passing here from Australia?—Cape Town is the port which they call at on the way out from England. A few years ago they would only stay out in the bay and take in vegetables and fresh meat and then proceed again without taking in coal, but when the price of coal came down they decided to enter the dock.

2117. Some of the lines called at Durban, did they not?—No, I do not think any of the lines running to Australia called there. They take their bunkers at

Durban coming back. The boats go from here to Australia, and although the price is higher here it would not pay them to go to Durban for coal, because it means at least four days out of their way. Perhaps a steamer burns 150 tons a day, and that is a big item. They have to go right out of their course to get to Durban, and it takes another day to get into the straight again.

2118. Is the call on the homeward voyage induced by the coaling facilities at Durban?—No, I think they pick up cargoes and, no doubt, the two things combine.

2119. Do you know what is the comparative cost of coaling at South African ports, say, Durban and Cape Town, compared to Aden and Port Said?—No, of course, it is all Welsh coal which is used there.

2120. Welsh coal is much higher now?—Yes, I have not got the figures. I could get them, but the rate is much higher.

2121. This combine of the coal mines in Natal, does it include all the Natal mines?—No, I believe there are two collieries not included.

2122. Are they large collieries?—Yes, they supply the Government with coal and they must stand outside —they must not join in any combination.

2123. Do they do much business outside the Government contracts? Do they cut the price of coal of the combine companies?—No, they sell on the same terms. One of the largest collieries, the Hlobane Colliery, we dealt with for one year, but we found them to be always short of coal and they could not produce sufficient to fill their orders, and we could not get as much coal as we wanted.

2124. Is the fact of their being outside the combine simply the result of the Government contract?—Yes, I think so, although they sell coal to the combine, or have done.

2125. Has it made any great difference in the price?—Yes, to Cape Town.

2126. What is the amount that you estimate?—I reckon the difference is between 21*s*. 6*d*. and 23*s*. and 24*s*. up to 26*s*., but the price at 23*s*. was really a special price. We paid that to one of the best collieries, and we paid a higher price than the market price because they were not anxious to sell as their sales were greater than their output.

2127. The difference per ton at 27*s*. made by that combine you suggest would be about——?—I should say about 4*s*. a ton.

2128. And you think yourself that that is a price in excess of what it should be?—Yes, in excess of what it should be if Natal collieries sold their own coal at Cape Town as they should do. This is their market, and they should sell their coal here.

2129. You speak in this memorandum of Natal coal being liable to spontaneous combustion. Is that a peculiarity confined to any particular areas, or does it affect one individual mine?—No, some of the collieries in a certain area are different. Coal from one colliery will be liable to spontaneous combustion, while in another case there is not much risk. It is not like Scotch and Welsh coal, where the area is more or less the same. There is a lot of difference in the Natal coals even in a small area.

2130. **(Mr. Sinclair.)** I understand the position of this combine to be this: That if a merchant who wanted to re-sell coal and chartered a steamer sent it to Durban for supplies it could not get them?—That is so.

2131. But if a steamer wanted to use coal for its own purpose would it be supplied?—Yes, there is no restriction on a ship coming along for bunkers; they could get it from any of the collieries or their agents. It was only, I believe, when it was shipped to Mauritius, India, or Cape ports that the distinction was made.

2132. The effect of this combination is to prejudice, in your opinion, both private consumers and local industries?—Yes, I reckon Cape Town suffers.

2133. I want to ask a question about storage. First of all, for bunkering coal are there any storage bins in the Cape?—No, we have only one coal store belonging to the Government in the docks, which has up to recently been entirely used by mail boats. That is the only store used with Temperley transporters, but otherwise they store in the open or in trucks and lighters.

2134. There is always storage for bunkering purposes?—Yes, there is always plenty of storage.

2135. But you think the cost of handling might be materially reduced if adequate provision was provided?—Yes, if they had proper storage bins it would be much better.

2136. As to the means used for loading. Are they modern?—Yes, I think so. Unless you had a coaling berth, I do not see any other way you could bunker a ship than the present. If you had a berth where you could put the ship they might load up direct, but we have not got one in Cape Town, because we have to bunker three or four ships at one time in different parts of the docks; so you run the trucks straight to the vessel and load from the trucks.

2137. Do you think, having regard to the configuration of the port, there is room for improvements in that direction?—Yes, I think so, but I do not think that they have been justified in doing it up to now, because the bunker trade has not been settled sufficiently.

2138. You think the time will come?—Yes, when they erect proper coaling and storage bins.

2139. Now as regards superior coals. Is there any quantity stored at the Cape?—Do you refer to Natal coal?

2139*a*. Yes, Natal, which is your best coal, I understand?—At present there is a fairly large quantity of coal in the docks from Natal and the Transvaal. I believe many steamers have come out lately well filled on account of the strike, and coal has been coming down here and has accumulated, but it is very seldom we are ever short of coal.

2140. I think you said that at the price at which you used to sell before this combination you made what you considered a satisfactory profit?—Yes, a splendid profit.

2141. We may take it, I suppose, from that that there were no bad debts?—No, we never made a bad debt in the bunkering trade. In the retail trade we made many, but in the bunkering trade you generally get your money from the steamer before you pay for the coal from the colliery.

2142. So the margin of profit in the case of bunker coal may well be smaller and yet satisfactory, whereas in the case of the household trade and industrial trade the margin has to be larger owing to the possibility of bad debts?—Yes, and, of course, for every one factory which is sound you would quote a lower price than another which is doubtful: you could not give a certain rate to every customer, but for bunkering you could do so, and the Government will do the work of bunkering for you. The only thing you have to pay is the freight between Cape Town and Durban. That leaves 9*d*. a ton clear, which is a good margin.

2143. I gather from you that the intervention of the Government has been to develop the bunkering industry in Cape Town?—I think if it were not for the action of the Government since Union, we should be doing no bunkering trade in this port. The Government have encouraged it and done everything they could to assist it, and this last move, when they reduced the railage on coal from the Transvaal overland, that just saved the situation, otherwise I think you would be paying 30*s*. a ton in Cape Town for bunkers at the present time.

2144. I presume there is no State-owned coal mine here?—No.

2145. All the coal mines are private?—Yes.

2146. Can you give us any information as to the attitude of the Government on the subject of this combination?—I know they were opposed to it, and supported the reduction of the railage on Transvaal coal so as to enable that coal to come in, which I think was the best that could be done.

2147. **(Sir Jan Langerman.)** What class of steamers bunker here, are they liners, cargo boats, or tramps?

—They are purely cargo and passenger boats to Australia.

2148. And no tramps?—Practically none of them.

2149. Could you increase your bunkering trade if you had cargoes to offer?—Yes, I think so.

2150. Is there no cargo at all?—No.

2151. Is everything in the hands of the steamship company?—Yes. If you have anything to ship you must make your arrangements with the conference lines.

2152. There is no chance of reducing rates of shipping through other channels?—No. No independent boats come out here.

2153. **(Mr. Tatlow.)** Is the present cost of coal at Cape Town seriously affecting the bunkering trade?—I think it has suffered a good deal, and some steamers have been prevented from taking bunkers who would have done so.

2154. It has prejudiced them?—Yes.

2155. You say that you object to the Natal coal-owners combining to fix the price?—No.

2156. You complain of the high price here, but is not the high price here the result of the combination?—No, the coalowners are getting the same price for the coal as we paid.

2157. Does the difference in price, then, go to this one firm here?—Yes, they are certainly reaping the benefit. It is just a matter of what they like to put on as freight between here and Durban.

2158. How far are the collieries from Durban?—About 300 miles.

2159. Durban must have advantages against Cape Town in regard to bunkering coal?—Yes.

2160. You do not imagine or hope that the two places should be absolutely equal?—I do not know. I think if the coalowners themselves in Natal had their depôt here there is no reason why they should not level up the price and make a uniform rate. I mean they could afford to charge less here and more in Natal. They would catch steamers here which are not going to Durban. It is a different business. I think it is for the want of information, but I think Natal is slightly jealous of Cape Town in the bunkering trade, but I wish to point out that we are not doing them out of their business at all. We are bunkering steamers that would not go round to Durban because it is too much out of the way. If you could put Natal coal down here at 1*l.* per ton I think that in twelve months' you would double your trade.

2161. At the time you withdrew from this bunkering trade was it your principal business?—Yes, the coal trade was practically all our business.

2162. **(Chairman.)** Your point is this then: that Cape Town competes in the bunkering trade less with Durban than with Teneriffe and Madeira?—Yes. I do not think it affects Durban at all so far as the business we do is concerned except, that we are selling their coal here instead of their selling it themselves. We are good customers to Durban and we are not selling in opposition.

2163. You are of the opinion that cheap bunker coal in Cape Town would bring vessels here which otherwise would bunker at the islands?—Yes. We do not wish to take away any business from Natal. There are no tramp steamers coming here now: those which came here years ago were only coal steamers and that business is now finished.

2164. What is the price of Welsh bunker coal on the islands?—I cannot give that, but it is pretty high. It pays them to come here and get Transvaal or Natal coal if the price is low.

2165. They get Transvaal or Natal coal here cheaper than English coal on the islands?—I would not say that they would at present, but taking the price at which we were selling they would give preference to us.

2166. You suggested in answer to Mr. Tatlow that they might sell at the same price at Cape Town as at Durban, but surely the natural thing would be to add the cost of the freight from Durban to Cape Town?—But I would like to look at it from a broader point of view. I maintain that coal is sold in Durban too cheap considering their position. There is nobody to compete with them and they could very well afford to put 2*s.* or 3*s.* a ton on their coal at Durban and take it off here provided they were doing the business themselves.

2167. **(Sir Jan Langerman.)** Cannot Delagoa Bay successfully compete with Durban in this matter of bunker coal?—Well, it means another two days' delay to go up there and they are not so quick in bunkering. I do not know whether they are any better now, but they did not bunker so quickly formerly. That is their only opposition and that is not a serious one. I maintain that there is plenty of trade for Delagoa Bay and plenty for Natal and you could increase the trade for bunkering at this port if you only made the coal cheaper.

2168. **(Sir Alfred Bateman.)** You approve of the Government policy of charging a lower rate for bunkering than the ordinary rate?—Yes, but the consumer does not get the advantage. When that reduction was made there was no reduction to the shipowner. The Government charged less money but the price has nevertheless gone up. I do not think the collieries have benefited.

2169. So the middleman has got the difference?—Yes.

2170. **(Mr. Tatlow.)** Who is it that pays the railway rate?—The buyer. We pay the railage. Every time we have had a reduction from the Government we have brought down the price for bunkering. We worked on a very small margin and we have been very successful, and it could be done far cheaper by the collieries themselves than we can do it.

Mr. John William Jagger, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Land Settlement and Irrigation," "Steamship, Post, and Telegraph Communications," "Empire Development," and "Fruit," see pp.* 6, 60, 160, *and* 317 *of this volume; and on "Exhibitions," "Statistics," "General Trade Questions," and "Legislation," see pp.* 124, 127, 145, *and* 181, *of* [*Cd.* 7707].)

2171. **(Chairman.)** Are you satisfied with the harbour accommodation which you have at Cape Town?—I think we are fairly satisfied here at the present time. I know that some improvements could be made, and I think the Railway Department has taken the matter in hand. For instance, we require deeper berths. I think we have a system here that does not obtain in any other country. We charge a ship dock dues on the basis of so much per day. For instance, the mail steamer would only pay 1*d.* per ton on her gross registered tonnage, as she stays less than 24 hours in dock on arrival. This is the only place I know of where that system exists and the result of it is that ships coming to this port get good despatch. In fact we put a premium on their getting out quickly. We brought this principle into use during the late war when we were pressed for room and when sailing vessels used to lie out in the Bay for 60 days and more. We gave the premium to vessels to go out quickly and I must say it worked very satisfactorily to the shipowners and to ourselves, up to now. Naturally we get a better use out of our quays under this system than could be got if a vessel could lie 12 or 14 days there. Now she gets out probably in half the time. So far as quay space is concerned we are not badly off. I believe that there has been tremendous impetus to the coal business of this port through that arrangement. It has given another outlet to the Transvaal coal. Up to that time Transvaal coal was only used for local consumption, which was certainly very big, and the only export trade they could do was *viâ* Delagoa Bay. But now, of course, Transvaal coal has three outlets, the mines, Delagoa Bay, and Cape Town. I think that it is a satisfactory arrangement all round.

good for the Transvaal mine owners and their coal, and also good for the railways and good for the trade of Cape Town.

2172. And you think that, now conditions at this port in regard to bunkering are satisfactory, it should assist from the point of view of the development of trade generally?—I think so. They might improve the coaling facilities in some directions, but I do not think it is a very pressing matter. As regards prices, under the old arrangement when the bunkering business was in the hands of the Union-Castle Company they had two prices, 24*s.* for one class, and 26*s.* for the other class, trimmed into bunkers. Now we can buy Transvaal coal at 22*s.* 10*d.* trimmed into bunkers. So it has brought down the price.

2173. What is the value of Transvaal coal compared to Natal coal?—So far as my information goes it is about 10 per cent. inferior calorific value. A lot of vessels call here on the way to Australia which cannot call at Durban. When we started bunkering it was not with the object of competing with Durban but with Cape Verde Islands, which are a big coaling centre. When vessels leave the Cape for Australia they take a southerly direction and do not go to Durban, which would mean going a considerable distance out of their way. But homeward it is another matter. They strike Durban first and then come down the coast. I think it works to the advantage of all concerned.

2174. I suppose you would recognise that deeper berths are extremely important with the view to attracting Australian vessels to this port?—Yes, I think it is more important, perhaps, to this port of Cape Town than to any other port in South Africa because we do expect to get a good portion of the Australian trade, especially in regard to coal.

2175. In your judgment, is the cheapness and the regularity of the supply of bunker-coal here a considerable factor in attracting vessels to this route?—I think there is no question that cheapness is a great consideration. Coal has been greatly brought down in price latterly. Up to the 1st November last the bunkering trade of this port was in the hands of a monopoly, the Union-Castle Steamship Company. They had pretty well the entire control of the Natal coal trade down here, and all the Natal coal which came down here in those days had to be brought in steam colliers from the Natal mines. Any coal agent here who wanted a supply had to obtain it from the Mail Steamship Company. This was pointed out to the Government pretty strongly and we said that in our opinion it was not satisfactory that the trade should be in one company's hands. So stringent was the combination that the Natal collieries would not deliver coal at Cape Town overland. To meet the situation the railway department then quoted a very low rate from the Transvaal. Up to that time Transvaal coal could not be had in Cape Town except *viâ* Delagoa Bay, being brought down by a vessel from there. The rate quoted was 14*s.* per ton, less 1*s.* rebate to coal bunkered, from Witbank in the Transvaal to Cape Town.

Cape Town, Wednesday, 4th March 1914.

The Hon. Sir THOMAS WILLIAM SMARTT, K.C.M.G., M.L.A., called and examined.

(*For the evidence of this witness on "Land Settlement and Irrigation," "Steamship, Post, and Telegraph Communications," and on "Fruit," see pp.* 8, 64, *and* 318.)

2176. **(Chairman.)** You recognise the great importance of a cheap supply of coal here?—Yes, and I recognise it is the duty of the State to do all it can to see that by no means whatsoever is there any chance of that coal falling into the hands of a combine, especially one whose interests might not be to encourage outside shipping which might take passengers and freight.

2177. And also to make Cape Town a more convenient port of call you require to have the depths of water and the quay accommodation requisite for the recent type of ship?—Yes, I recognise from the report that the Commission has drawn up and the papers attached that, for economic transit, if you increase the size of your steamers you must increase also their draught. Under those circumstances I think that in the interests of the country the points you mention will have to be considered.

2178. **(Sir Rider Haggard.)** You spoke of the dangers of a coal combine. Is there any fear of such a thing?—I do not know definitely; the only thing that I fear would be that a combine would put up the price of coal, and that would be extremely detrimental to the general interests of the port.

2179. I suppose, if necessary, that could be stopped by legislation, could it not?—I daresay it could. It would be very difficult to do, but I know the Government have reduced the overland rates for coal for the purpose of preventing an excessive rate being charged in Cape Town.

2180. Is that recently?—I think last year.

2181. Coal is now run down here at a very cheap rate, but do you think it really pays?—Yes, indirectly. Coal is run down for the purpose of allowing ships to bunker in Cape Town at a reasonable rate, but what the rate is I do not know.

2182. It is still dearer than bunker coal at Durban, is it not?—Yes.

2183. Suppose there was a big line of large steamers running to the Cape and Australia, would there be any difficulty in the way of expense or otherwise in supplying them with sufficient coal in such a fashion that they need only coal once here, at the Cape?—I should not think so. I should think it would be in the interests of the State to do all they could to encourage traffic of that kind.

2184. Are your bunkering facilities all they should be?—I am not sufficiently expert to express an opinion.

2185. You have, I believe, some scheme on hand for deepening the docks?—I have only seen the report of the Engineer. I think this visit of the Commission has brought the subject more prominently before the public eye than it was before. It has called attention to the requirements in the way of deeper docks if we are to have great developments in the future in agriculture and general trade.

2186. **(Sir Jan Langerman.)** With regard to the coal combine. You approve of the reduction which has been made by the Government to bring coal down from the Transvaal?—I cannot say that I approve, because at present I do not really know what the condition of the rates is; but I entirely approve of the policy of doing everything within reason to see that steamers that coal at Cape Town are well supplied with bunker coal and to prevent any tendency on the part, of a combine to put up the price of such coal to an unreasonable figure.

2187. But you are aware that the Castle Company by capturing the business and making agreements with the coal mines in Natal and carrying the coal in their own bottoms, have practically created a monopoly in the coal trade?—What I think anybody would say from a common sense point of view would be that a steamship company might possibly not be desirous of supplying coal to its competitors at such a cheap rate as to encourage them to alter their ordinary mode of doing business and become competitors.

2188. The position was created here by the Union-Castle Company having the bunkering trade in their own hands and charging what they liked, and also by having the local trade in household coal in their own hands, because nobody could buy any coal from the mines in Natal except through them. Under the circumstances the Government was perfectly justified in breaking up that combine by reducing the rates from the Transvaal?—I think the Government is justified in doing everything they can to break up such a combination if it exists.

2189. **(Mr. Sinclair.)** Is there, in your opinion, a coal combine in existence now at the Cape?—On that subject I have no definite grounds for expressing an opinion.

Mr. LUDWIG WIENER called and examined.

(For the evidence of this witness on "Steamship, Post, and Telegraph Communications," see p. 70.)

2190. **(Chairman.)** You are anxious to see Cape Town become a more important harbour?—It would be one of the best harbours in the world, I think, if full advantage were taken of its position. The coal gives us the paramount position, and it is the only way eastward, except through the Canal.

2191. Are you satisfied with the conditions under which bunker coal is available in Cape Town Harbour?—All the railways and harbours of the Union are owned by the Government, and that is an immense advantage. But unfortunately the political element has largely entered into the question, and there exists jealousy between the private shipping and landing interests of the various ports, which have interfered very much with free action. But at the same time through the railways being Government-owned we have a powerful control over the coal industries of Natal and Transvaal. One drawback is our coal has to be brought a longer distance from the mines than is the case in England, where the mines are close to the coast.

2192. Are you satisfied with the present conditions of supplying bunker coal in Cape Town Harbour; are they satisfactory?—Yes and no; there is uncertainty about it. We have made strong representations to the Government, when Mr. Sauer was Minister of Railways and Harbours, and through his influence on the Railway Board a flat rate for coal was introduced. Since then the flat rate has been severely attacked, due to local jealousies, instead of looking at it in a broad way, as a benefit to the Union as a whole. Other ports fight Cape Town. As long as the flat rate remains it places us in a very powerful position. The rate is 14*s.*, with 1*s.* reduction for bunkering purposes. And then we established a reasonable consolidated rate for bunkering coal from truck or lighter to ship, including trimming it into bunkers, of 2*s.* a ton. The rate at present under contracts is running at about 22*s.* 6*d.* a long ton here, on board free.

2193. Is that for Transvaal coal?—Yes, now. There is an extraordinary thing I would mention. Formerly, ships would object to take Transvaal coal. They said it was inferior to Natal. Somehow or other now, however, Transvaal coal has come to the front and is successfully competing with Natal coal.

2194. In regard to that rate of 22*s.* 6*d.* for Transvaal coal, do you consider it is as cheap as you expect to get Transvaal coal for bunkering purposes at Cape Town?—No, we have been aiming at 20*s.* That would place us in a very powerful position indeed, because the traffic that we have captured at this end of the coal business we are now doing was the bunkering trade at the islands. And what helped us very materially in that direction was because freights were very high on cargo to Australia, and naturally ship-owners preferred carrying cargo instead of coal, especially as if ships could get coal here they could carry a good deal more cargo from England to Australia.

2195. What is the coal worth at the islands?—It varies. It runs from 25*s.* to 32*s.* 6*d.*, but still they are very powerful competitors occasionally.

2196. Then regarding the question of harbour accommodation here and the depth of draught; do you agree with the view that Cape Town Harbour must be kept up to the requirements of the most modern vessels?—As long as I have been connected with the Table Bay Harbour, since 1882—and I was Chairman of the Harbour Board for some years—that was the object for which I always strove. And I may say that we have lately induced the Government to adopt a scheme of harbour improvement and for developments in the near future. The wharf where now the mails are berthed is to be widened at right angles to the breakwater. When this construction is completed we will have a 40-feet berth at low water, but in view of ships growing in size the administration has decided to increase the proposed depth to 44 feet.

2197. We have had the plans.—That would give us about four berths with a draught of over 36 feet and one of 44 feet low water.

2198–9. I think the plan which has received the approval of the Government is for an expenditure of three millions?—No, certainly not; we do not suggest spending anything near as much as that.

(Sir Alfred Bateman.) That was on the complete scheme. The expenditure in one year was to be considerably under 300,000*l.*, and the ultimate expenditure at all the ports may be three millions, or thereabouts.

2200. **(Chairman.)** Extending over a period, of which a portion of the expenditure has been immediately sanctioned?—Well, we are making a start *here.* (*Indicating on plan.*)

2201. Then that extension here has received final approval?—Yes. It will cost about 300,000*l.*

2202. **(Mr. Campbell.)** What is the work on which 300,000*l.* is to be spent?—(*Witness indicated on the map.*) A lot of rubble stone has been pitched into the sea there, they are going to fill that up and widen the wharf by means of building a retaining wall at a depth of 44 feet, which I have already stated.

2203. **(Chairman.)** When do you hope to get that completed?—We have just completed *this* (*indicating*) and we are busy with *this* (*indicating*). I suppose this will take about eighteen months or two years. We have to finish one jetty at the time, then build the other; but there is nothing to prevent us from going on at once with outside wharves. If we can only get the Union Government and the Railways to look at it in that way it should go ahead at once.

2204. It has not yet been finally approved?—Yes, it is in the scheme, but the money has yet to be provided.

2205. **(Mr. Tatlow.)** Did you say that you were not satisfied with the rate of 14*s.* per ton on coal from the Transvaal?—I did not mean that quite. I said we were trying to get it down to 20*s.* put on board. That was our aim.

2206. Is not the rate for coal from the Transvaal by rail 14*s.* and 1*s.* less for bunkered?—Yes.

2207. Which rate the railway has established lately?—If we could get coal from Natal cheap at the pit's mouth and a rate of 4*s.* a ton per boat, we could do it at 20*s.*

2208. Do you regard the 14*s.* rate as low as the railway can go?—Yes and no. Well, you see we have a great deal of stuff going up country and trucks are wanted, and so they either have to come empty to fetch the stuff from these ports or bring coal. In this respect our position is very strong—much stronger than any other port of the Union. Most of the other ports have to get down empty trucks.

2209. **(Sir Rider Haggard.)** You talked about the cost of the carriage of coal by the railway from the Transvaal. How does it compare with the carriage by sea from Durban. At present which is the more costly way?—At present the sea route would be the dearer,

because they put up the rates of coal in Natal—the Natal Coal Owners' Association—against us by nearly 2*s.* a ton at the pit. I am speaking of Natal coal brought down here by sea. Two years ago rates were 2*s.* less at the pit mouth than they are to-day. Then freight from Natal to-day is very much dearer than it was. I think all that has tended to make the price of coal from Natal at Cape Town nearly 3*s.* or 4*s.* a ton dearer last year than before.

2210. In normal conditions, which is cheaper—to bring it by rail or sea from Natal?—Of course, the railway rate is an arbitrary rate—a flat rate—so that it is difficult to say. But, on the whole, I think that if we can get cheap freight from Natal and a normal price at the pit, you could lay the coal down here about the same as the other way by rail from the Transvaal, with this advantage, that that coal is now held to be better and there is only one handling by rail instead of several by boat. The coal from Transvaal is taken from the pit and put into the truck and from the truck to the ship. But from Natal it is handled from the pit to the truck and then again into one of these big deliveries, then into the ship and then from the ship into the lighter, or truck, and then into the export ship, and in that way Natal coal is disadvantaged. Transvaal coal is not broken up so much, and there is a saving of cost to the railway in handling it in putting it on board, because they put it straight from truck into the ship and trim it into bunkers.

2211. Do you think the prospect is that coal will ultimately come here by ship or by land?—That is a difficult question to answer. It depends on the railway rates.

2212. I gather that you think that at the normal rate of cost of carriage at which the coal is carried, it would be cheaper to send it from Natal by ship than from the Transvaal by rail?—No, if the quality is good I prefer it by rail, and the shippers like it better too.

2213. But the Natal coal is the better, is it not?—Well, that is an opinion which depends entirely upon the individual's point of view.

2214. (**Mr. Sinclair.**) As regards the price of coal we have heard a good deal of evidence about the combination, and it was put to us, as I understood it, that the result of the combination had been to raise the price of coal from about 22*s.* 6*d.* to 25*s.*; but has there not in the interval been an increase of cost for coal at the pit?—Yes, about 2*s.*

2215. And a rise in freight?—Yes.

2216. Those two figures would of themselves about account for the difference in the cost?—Yes, about 4*s.*

2217. So it is scarcely fair to put the comparison between 22*s.* 6*d.* to 25*s.* without also pointing out that these two items would account for a considerable difference in the extra cost?—Yes.

Mr. K. Spilhaus, of Messrs. William Spilhaus and Co., called and examined.

(*For the evidence of this witness on "Freights" and "Bills of Lading," see pp.* 74 *and* 88.)

2218. (**Chairman.**) You have considered the question of cheap bunker coal at Cape Town?—Yes, we are interested in that subject.

2219. What can you tell us about that?—I have rather different views from some of the evidence given here the other day. I may say that Mr. Cook gave evidence and I should inform the Commission that we are the firm that he referred to who did business together with him some two years ago. We started the Coaling Company in which Cook and ourselves were equally interested, and the arrangement was, roughly, that we should finance the business and he should do the work. We fixed the capital at a nominal sum for the purpose of division of profit, and I saw yesterday that he had stated in his evidence that we made the huge profit of 100 per cent. I am afraid he has given the Commission a wrong idea. It is quite correct that we did make 100 per cent., but he forgot to mention that in the first instance when the contracts were made with the shipowners we had to give our firm's guarantee, and when we entered into contracts for the coal we had again to give a guarantee without asking him to contribute further capital, so as to make the Company's position strong enough, and when we chartered a steamer we had to give our firm's guarantee to the steamship owners; so that you see he takes no notice whatever of these facts. He tells you that we made 100 per cent., but in reality the profit made by the Company was 2½ per cent. on the turnover. If we had not treated him quite so well he would never have made 100 per cent. and we might have forced our Company into liquidation and insisted on an increase of capital.

2220. However that Company has now come to an end?—Yes.

2221. Why did you go out of the business?—Because it was too great a risk to undertake. We had to make contracts with the shipowners beforehand and before we could buy the coal in Natal, and we had to charter a steamer on a year's charter at a very high rate. At that time freight rates were going up, which made us very anxious, and we decided that the business was too risky to continue for another year, so we told Cook that we would not go on. The amount of profit would have been quite satisfactory if it were not out of proportion to the risk.

2222. The risk was that you had to charter the "Tiger" or some other vessel beforehand?—Yes, before we had a single order. We had to take orders from shipowners without a guarantee of a minimum quantity. We had to take a certain quantity every year from Natal without having a single order. We thought it was out of all reason. I am very glad we did get out of it.

2223. I think Mr. Cook also told us that one of the main causes of the business coming to an end was that the Natal collieries who supplied the trade formed a combination and passed the trade into other hands?—Well, that was not so, because we never obtained our supplies from the Natal Navigation or Glencoe Collieries. Those are considered to be the first-class coals. They and the Burnside Coal Company and a few others form the Natal Coal Owners' Association, and they were always confined to the Union-Castle Company. Our business always was with outside collieries, and we never bought from the Natal Coal Owners' combine.

2224. Do you say anything in respect to Mr. Cook's figures as to the cost of bringing the Natal coal from the colliery to Cape Town?—His figures are correct when compared with the first year in which we did business. Freights were very low. We chartered the "Tiger" for 1,060*l.* a month, and a year after that we handed her over to the Union-Castle Company and sub-let her for 1,350*l.* a month.

2225. When you had chartered her at 1,960*l.* that brought out your cost of transporting the coal from Durban to Cape Town to how much?—Under the most favourable circumstances to about 5*s.* 3*d.*

2226. Therefore, roughly speaking, the cost of carrying coal from the Natal Colliery to Cape Town, including railway quay dues and freight, was between 13*s.* and 14*s.*, which is the same figure as the flat rate on Transvaal coal. He gave us 6*s.* 8*d.* to Durban minus 1*s.*, quay dues or handling at Durban 7½*d.*, freight 5*s.* 6*d.*?—You see your freight changes according to the market. At the present time it would not be right if I said the cost would come to that. I should think it would come to quite 7*s.* to-day.

2227. That brings the cost approximately to the same figure as the cost from Witbank to Cape Town, 13*s.* to 14*s.*?—Yes, about that, but I want to say

something else. These costs are calculated not reckoning any delay. There have been very serious delays, especially lately, in loading the steamers, and this naturally increases the cost of freight.

2228. Is there not good accommodation at Durban?—There is a shortage of trucks from the collieries to the port.

2229. Now, as a firm interested in cheap freight from Cape Town, do you recognise the importance of cheap bunker coal here?—Yes.

2230. Do you consider that under the present circumstances the position is satisfactory?—No, not quite.

2231. What do you suggest?—I would suggest that first of all the Natal collieries are supplied with more trucks and that it is absolutely made impossible for a collier to be detained a fortnight or seven days, because that means additional cost which has to be met by the purchaser in the end, and, further, I suggest a better mode of handling the coal at Cape Town. The coal is not handled as economically as it should be.

2232. That is to say, the coal which is being put on board?—Yes. The discharging of the colliers is too slow altogether. I made a proposition some time ago when we intended to go in for a great combine. The combine we all thought would be very beneficial because it would combine the forces and we would be able to economise in the cost of handling the coal. We suggested that coal elevators and automatic transporters should be provided from the quay and waterside, which would enable colliers to discharge in half the time. A 5,000-ton collier arriving here on Monday should be finished on Thursday so as to reach Natal on the following Monday.

2233. What was that combine that you refer to. Had it any reference to the Union-Castle Company?—It was the Union-Castle Company and other coal suppliers interested, but there was a great outcry against the monopoly and the matter was dropped.

2234. I understand it was dropped on account of the public outcry?—Perhaps the Mail Steamship Company dropped it because they did not think it worth while to enter the combine in face of public criticism.

2235. If that monopoly had gone through do you think the price of coal would have been raised?—No, I think we could have reduced it by 2*s*. If you take the present rates of freight and the present cost of coal at Natal, the best Natal coal could be sold for 24*s*. instead of 26*s*.

2236. Trimmed into bunkers?—Yes.

2237. Allowing what price at the pit in Natal?—About 6*s*. 8*d*.

2238. What is the current price?—I think for the best coal it is 9*s*. now.

2239. That is for ordinary bunker coal, is it not?—It is only the best coal that I am dealing with.

2240. What have you to say about the Transvaal coal coming down by rail? I know that, as agents for shipping companies, we prefer Natal coal; but the effect of the Transvaal coal coming down has been to prevent any economical working of the Natal coal business because the amount of business done in Natal coal is so small that it does not pay more than oneman to work the business. It is left in the hands of one firm now and that firm has perhaps not so many resources to fall back upon as the Mail Steamship Company used to have.

2241. That is, that Transvaal coal coming in has knocked everybody out of the Natal coal business except one firm?—That is so.

2242. **(Mr. Tatlow.)** You spoke about the scarcity of railway trucks; did you mean for coal?—Yes.

2243. For coal from where?—Natal.

2244. Is it a serious scarcity?—It was.

2245. Is it still a serious matter?—I am not in the business any more, so I cannot say.

2246. You say that business has fallen off a good deal in consequence?—Yes.

2247. Did you make representations to the railway company at the time?—We made continual representations.

2248. With what effect?—In many instances they told us that the collieries were to blame and they had no coal, but when we referred back to the collieries they blamed the railways, and so it went on.

2249. Do the collieries not own their own trucks?—Not in this country.

2250. **(Sir Alfred Bateman.)** Do you consider that the present cost of bunker coal at Cape Town is fair?—Yes, because certainly Natal coal has gone up in price and I consider that the collieries did deserve this extra price.

2251. It is the combination of collieries that keeps the price up?—Yes. It did have the effect of raising the price, but I do not think that it was unduly high. Before that they rarely paid any dividend, whereas in our days they made a small dividend.

2252. **(Mr. Sinclair.)** You told us that you went out of the coal trade owing to the risk?—Yes.

2253. Was that risk brought about by combination?—No, I cannot say that.

2254. You had to charter your vessel and sell the coal before you could buy it?—Yes.

2255. That suggests a combination, does it not?—No. It is the nature of the business. It is not only done here but all over the world. Coalowners supply you with coal at a certain price but the shipowners do not bind themselves to take any definite quantity.

2256. Then there was nothing abnormal about the conditions that brought about your going out of the trade?—No, except that we could not get the best quality of Natal coal. If we could have secured the best quality of Natal coal we might have had a chance of getting business.

2257. Was that due to combination?—No, we were unsuccessful in getting it. It was a competition between ourselves and the Union-Castle Company, and they got in.

2258. There was no open market?—Yes, but the Union-Castle Company concluded their deal and we were out of it.

2259. After the Company concluded its deal you could not buy?—No. But we did the same the year before, we concluded our deals with the other collieries on the same terms. You could not do anything else, you could not have two people quoting the same coal, because there is only a limited supply. It is quite a reasonable condition. Even the present contractors make that condition, and the present contractors for Transvaal coal, a combine controlled by Sir John Ellerman, also make that condition. It is just a question of being in or out of the market. We have been in before and we may be in again next year. We do not know.

Cape Town, 6 March 1914.] [*Railways, Harbours, and Coal for Bunkering and Shipment.*

Cape Town, Friday, 6th March 1914.

Mr. WILLIAM WILSON HOY, General Manager of Railways and Harbours for the Union of South Africa, called and examined.

(*For evidence of this witness on "Steamship, Post, and Telegraph Communications," see p. 75.*)

2260. **(Chairman.)** You are General Manager of Railways and Harbours in the Union?—Yes.

2261. You have prepared a statement for the Commission?—Yes, it is as follows:—

The whole of the railways and harbours in the Union of South Africa are, with few exceptions, the property of the Government, and since the 31st May 1910—the date of the Union of the Cape, Orange River, Transvaal, and Natal Colonies—have been administered under the provisions of the South Africa Act of 1909.

The Act of Union states *inter alia* that—

> "all ports, harbours, and railways belonging to the several Colonies at the establishment of the Union shall, from the date thereof, vest in the Governor-General in Council";

and that

> "subject to the authority of the Governor-General in Council, the control and management of the railways, ports, and harbours of the Union shall be exercised through a Board consisting of not more than three Commissioners, who shall be appointed by the Governor-General in Council, and a Minister of State, who shall be chairman. Each Commissioner shall hold office for a period of five years but may be re-appointed."

The chief executive head of the department is the General Manager of Railways and Harbours, with headquarters at Johannesburg.

The Act of Union also provides that—

> "so far as may be, the total earnings shall not be more than are sufficient to meet the necessary outlays for working, maintenance, betterment, depreciation, and the payment of interest due on capital, not being capital contributed out of railway or harbour revenue."

Provision is also made under the Act for the establishment of a Railway and Harbour Fund, into which all revenues are paid and from which is withdrawn all moneys necessary to meet the expenditure of the Railway and Harbour Department, but only such expenditure as has received the approval of Parliament. Withdrawals from the fund may be made for unforeseen expenditure to the extent of 300,000*l.* or such additional sum as is represented by the excess of the actual revenue over the estimated revenue. Such expenditure, however, must be reported as soon as Parliament meets.

All profits earned remain at the credit of the fund, and are not paid to the Treasury, as was the practice prior to Union.

Expenditure on capital account is made from moneys received from the Treasury out of loan funds. Unexpended balances are returned to the Treasury.

The Administration has no liability in respect of the cost of raising or discount expenses in connection with the flotation of loans. Such expenses are wholly defrayed by the Treasury, who find the requirements of the Administration jointly with the requirements of Public Works, &c.

RAILWAY SYSTEM.

Lines open for Traffic.

The length of the railway system within the Union at the 31st December 1913, was 8,783¾ route miles, of which 8,180¼ miles are of standard gauge (3 ft. 6 ins.) and 603½ miles of narrow gauge. The mileage in each of the Provinces is as follows:—

	Cape of Good Hope.	Natal.	Transvaal.	Orange Free State.	Total.
Standard Gauge (3 ft. 6 ins.).	Miles.	Miles.	Miles.	Miles.	Miles.
Government-owned	3,368¼	890	2,336	1,162¾	7,757
Private lines (worked by Government)	115¾	92½	6	4	218¼
Private lines (not worked by Government).	205	—	—	—	205
	3,689	982½	2,342	1,166¾	8,180¼
Narrow Gauge (2 ft. and 2 ft. 6 ins.).					
Government-owned	271	176¾	26¾	—	474½
Private lines (not worked by Government).	121	8	—	—	129
	392	184¾	26¾	—	603½
Total Mileage.					
Government-owned	3,639¼	1,066¾	2,362¾	1,162¾	8,231½
Private lines (worked by Government)	115¾	92½	6	4	218¼
Private lines (not worked by Government).	326	8	—	—	334
	4,081	1,167¼	2,368¾	1,166¾	8,783¾

The *capital cost* of the lines that are the property of the Government, including the cost of providing rolling stock, equipment, &c., is 82,574,580*l.* This is equivalent to an average cost of 10,032*l.* per route mile.

The *physical features* of the country traversed by the railways vary tremendously. The fact that lines have been constructed with gradients of 1 in 30 and curves of 300 feet radius in Natal, while the ruling

gradient of the main line in the Orange Free State is 1 in 100, will readily indicate the diverse nature of the country on the coast belt as compared with that of the interior.

In this respect the following particulars of the main lines from the four principal ports to Johannesburg—the principal centre of the inland portion of the Union—may prove interesting:—

Main Line to Johannesburg.	Length in Miles.	Ruling Gradient.		Sharpest Curve.	Highest point reached.	
		Coast.	Inland.		Height.	Distance from Coast.
				Feet Radius.	Feet.	Miles.
From Cape Town - - - -	958	1 in 40	1 in 80	330	5,870	940
,, Port Elizabeth - - - -	713	1 in 40	1 in 80	462	5,735	713
,, East London - - - -	666	1 in 40	1 in 80	330	5,735	666
,, Durban - - - - -	486	1 in 30	1 in 80	300	5,735	486
,, Delagoa Bay - - - -	367	1 in 40	1 in 80	410	6,463	212

Lines under Construction.

The total mileage of the lines under construction at the 31st December 1913 was 250½ miles, estimated to cost 1,334,211*l.*

These are practically all developing lines, as will be observed from their location on the accompanying map.*

Lines authorised but not commenced.

In addition to the mileage under construction, an additional number of new lines have been authorised, and construction of these will be taken in hand as soon as possible. The total mileage of these new lines is approximately 794½ miles, and the estimated cost 2,731,631*l.*

On the completion of all lines authorised, the total mileage of Government-owned lines will be 9,276½ miles.

A map* indicating the lines open for traffic, lines under construction, and lines authorised, or under survey, differentiating by colours between 3 ft. 6 ins. and 2 ft. gauge, accompanies this memorandum for the information of the Commissioners.

Policy in Construction of New Lines.

The policy of the present Government is to construct all new lines of a standard gauge, and as cheaply as is compatible with safety. Second-hand sleepers and rails are used wherever possible, and the standard of construction is decided wholly in accordance with the demands that will be made upon the line by the traffic that is anticipated. No attempt is made to lay down a new line of the same standard as that of lines already carrying fairly heavy traffic. By this means the greatest mileage is obtained from the expenditure allotted for new construction purposes.

Principal New Works.

The principal new works at present in hand are those of relaying, regrading, and deviations of the permanent way. The relaying and regrading is being carried out principally on what is known as the Cape Western Main Line; that is, the line running northwards from Cape Town to Rhodesia. Rails of 80 lbs. to the yard are being substituted for those of 60 lbs. By this means the existing lines are raised to a higher standard of efficiency to meet the increased demands that are being made upon them by reason of the increased weight of locomotives and rolling stock which are now being brought into service, and incidentally the construction of new lines with the released material is made possible at a very low cost.

A very large work of deviation is being carried out on the Natal main line—Durban to Johannesburg. The length of the deviation is 18 miles and the total cost is estimated to be 275,000*l.* When the work is completed, much heavier train loads will be taken; the ruling gradient between the coalfields and Maritzburg being reduced from 1 in 30 to 1 in 65.

* Not reprinted.

Rolling stock.

The total quantity of locomotives and rolling stock in service at the close of 1913 was as follows:—

	Quantity.
Locomotives—Standard gauge - -	1,428
,, —Narrow gauge - -	30
Total - -	1,458
Coaching stock—Standard gauge -	2,390
,, ,, —Narrow gauge -	82
Total - -	2,472
Wagon stock—Standard gauge -	24,684
,, ,, —Narrow gauge - -	325
Total - -	25,009

Since Union there has been a steady increase in traffic, necessitating the purchase of rolling stock in very large quantities. The number under each class purchased since Union is as follows:—

Purchased in:—

	1910	1911	1912	1913	Total.
Locomotives - -	63	33	61	51	208
Coaching stock -	89	193	158	137	577
Wagon stock -	683	871	939	1,227	3,720

With the introduction since Union of locomotives of high tractive power, the figure of average tractive power of all locomotives in service on the 31st December 1912 was 21,103 lbs. The locomotives brought into service during 1913 ranged from 28,000 to 36,000 lbs., so that the average for last year has been considerably increased.

The average carrying capacity of merchandise stock at the date of Union was 17·48 tons; this was increased to 18·92 tons at the commencement of last year.

With the continued increase in coal traffic there has been a constant demand for locomotives of high tractive power and wagon stock of high carrying capacity, and in some cases the traffic has reached such proportions that the capacity of many of the lines has been taxed to the utmost. This latter feature has naturally made the employment of locomotives of the highest tractive power and wagon stock of the highest carrying capacity imperative, with the result that the purchase of rolling stock during the past year has been, and for another twelve months, at least, will continue to be, in this direction. The factor of time of trains occupying sections is now a very important consideration.

Staff.

The total number of staff employed on the railways at the 31st December 1913 was :—

	Number.
European - - - - -	32,356
Natives, Indians, and coloured -	30,310
Total - - - - -	62,666

The amount paid in salaries and wages may be stated to be approximately 6,500,000*l.*

So far as the employment of the staff is concerned the conditions of service are laid down by Act of Parliament passed in 1912. Copy of this Act,* together with the regulations* framed under the Act, which reflect very fully the conditions under which all grades of servants are employed, accompanies this memorandum.

All entrants to the service are compelled to become members of the Superannuation Fund and the Sick Fund. Copy of the rules and regulations* governing these funds are also submitted for the information of the Commissioners. The Superannuation Fund involves contributions by the members at the rate of 3 per cent. of their emoluments, while the contributions to the Sick Fund are in accordance with a fixed uniform scale. The Administration pays £ for £ contributions made by all members in the case of the Superannuation Fund, and 60 per cent. of the total contributions by members in the case of the Sick Fund.

Stores.

The total quantity of stores in hand at the 31st December 1912 was roughly 1¾ millions, while the total purchases made during the year amounted to 4,630,000*l.* Of this latter amount 2,266,437*l.* was required for purchases made through the High Commissioner in London, the balance of 2,364,225*l.* representing purchases made locally.

The total quantity of coal received during the year to meet the requirements of the Administration totalled 1,671,528 tons. for which 414,483*l.* was paid. The average cost per ton of coal to the Administration was, therefore, 4*s.* 11½*d.*

Of the total purchases the largest item was that of rails, sleepers, and fastenings, totalling 1,198,235*l.* This is an abnormally high amount and was due to the large quantity of relaying and new construction work which was carried out during the year.

System of Control.

The entire control of the railway is centred in the General Manager to whom the three Assistant General Managers, each controlling their respective systems, are wholly responsible. The headquarters of each of the three systems are situated at Cape Town (System A), Bloemfontein (System B), and Johannesburg (System C). Under each Assistant General Manager, and directly responsible to him, are divisional superintendents. These officers control one of the divisions in each system. There are altogether eight of such divisions—two in System "A," three in System "B," and three in System "C"—controlled from Cape Town, Kimberley, Port Elizabeth, East London, Bloemfontein, Durban, Johannesburg, and Pretoria. In the case of the divisions controlled from Cape Town, Bloemfontein, and Johannesburg, where Assistant General Managers are stationed, the office of divisional superintendent is dispensed with and the work of the division, in addition to the work of the Assistant General Manager, is carried out under that officer. Under each divisional superintendent there are superintendents and assistant superintendents (technical, commercial, and operating), by whom the staff operating the railways are immediately controlled.

Financial Results of Working—Railways.

The financial results of working for the year 1913 are as follows :—

Gross earnings - -	12,388,755*l.*
Gross expenditure - -	8,964,690*l.*
Net earnings* - - -	3,424,065*l.*
Net earnings per cent. of capital - - -	4·2 per cent.
Earnings per train mile -	8/1·9*d.*
„ „ open mile -	1,550*l.*
Expenditure per train mile -	5/10·9*d.*
„ „ open mile -	1,121*l.*
Percentage of gross expenditure to gross earnings - -	72·4 per cent.

Passengers carried; number of journeys :—

	No.
First class - - -	15,847,042
Second class - -	13,116,706
Third class - -	14,244,474
Total - -	43,208,422

Tonnage carried :—

	Tons.
Goods and minerals -	5,416,694
Coal - - -	6,985,532
Free hauled - -	2,313,167
Total - -	14,715,693
Train mileage - -	30,359,933
Train and engine mileage -	38,933,145

In comparison with the results of working prior to Union, the following increases and decreases are to be noted :—

——	Increase.	Decrease.	Per Cent.
Gross earnings -	1,932,936*l.*	—	18·49
Gross expenditure -	3,289,032*l.*	—	57·95
Earnings :			
Per train mile -	—	2/5·7*d.*	23·28
Per open mile -	19*l.*	—	1·24
Expenditure :			
Per train mile -	1·6*d.*	—	2·3
Per open mile -	290*l.*	—	34·9

——	Increase.	Per Cent.
Passengers carried :—		
First class - - -	6,125,048	63·06
Second class - -	4,501,827	52·26
Third class - - -	4,380,212	44·40
Total - -	15,017,087	53·26
Tonnage carried :—		
Goods and minerals -	1,678,602	44·91
Coal - - - -	1,788,458	34·41
Free hauled - - -	980,559	73·58
Total - -	4,447,619	43·32

As will be observed, the earnings have not advanced in the same ratio as that of the expenditure. There are several notable reasons that account for this. First, a sacrifice in revenue by the reduction of rates has been made since Union, which at the time of the reduction was calculated to be equivalent to a sacrifice of 1,336,000*l.* per annum. Secondly, through the

* Does not include results of working subsidiary services such as catering, &c.

development of maize, coal, and other traffic, which is carried at exceedingly low rates, the effect has been to disturb very materially the relationship of the earnings to the expenditure. A third factor is that of the increments, concessions, and privileges which have been granted to the staff since Union, figures for which are not available, but which may be stated to amount to, approximately, 900,000*l.* per annum. Yet another factor is that in 1909 contributions in respect of depreciation were not made by the late Cape and Natal Administrations. This represents an increased charge to working of 1,000,000*l.* per annum.

The total tonnage conveyed during 1913 is, I think, the highest on record, an advance being noticed in each of the main classes of traffic. The number of passengers conveyed also shows a steady increase.

The work necessary to accomplish the conveyance of the traffic mentioned above is reflected in the increased train mileage, which amounts to 10,697,489, equal to an increase of 54·41 per cent.

A statement showing the financial results of working for each year since 1909 is appended hereto, for the information of the Commissioners—Statement No. 1.

Rates and Fares.

The rates charged per mile for ordinary passenger fares, single journey, are as follows:—

	1st.	2nd.	3rd.
	d.	*d.*	*d.*
Up to 200 miles - -	2·0	1·33	1·0
„ 300 „ - -	1·95	1·3	0·9
„ 400 „ - -	1·9	1·27	0·9
„ 500 „ - -	1·85	1·23	0·9
„ 600 „ - -	1·8	1·2	0·9
„ 700 „ - -	1·75	1·17	0·9
„ 800 „ - -	1·7	1·13	0·9
„ 900 „ - -	1·65	1·1	0·9
„ 1,000 „ - -	1·6	1·07	0·9
„ 1,100 „ - -	1·55	1·03	0·9
„ 1,200 „ - -	1·5	1·0	0·9
„ 1,300 „ - -	1·45	0·97	0·84
„ 1,400 „ - -	1·4	0·93	0·79
„ 1,500 and over -	1·35	0·9	0·75

Return fares are paid on the basis of single fare plus 75 per cent., while excursion fares are generally charged at single fare for the double journey. Natives travelling by goods or recognised native trains are charged:—

Up to 100 miles - - 3rd class fares.
101 to 200 miles - - 8*s.* 4*d.* per head.
Over 200 miles - - ½*d.* per head per mile.

Suburban Fares.

In populous suburban areas a special scale is charged for passenger fares, the rates per mile for which are as follows:—

	Single.			Return.		
	1st.	2nd.	3rd.	1st.	2nd.	3rd.
	d.	*d.*	*d.*	*d.*	*d.*	*d.*
5 miles -	1·8	1·4	1	2·4	1·8	1·4
10 „ -	1·8	1·3	1	2·3	1·7	1·3
15 „ -	1·6	1·3	1	2·0	1·7	1·3
20 „ -	1·5	1·2	1	1 8	1·5	1·2

Terminals on Goods Traffic.

With a few exceptions, separate terminal charges are not levied on goods traffic; the rates, which generally taper down per ton per mile as the distance increases, is inclusive of all terminal services. On certain low-rated commodities, charged at a uniform rate per ton per mile, 10*d.* per ton is added for terminal charges.

Harbours.

As already stated, all harbours are controlled by the General Manager in conjunction with the railways.

The principal harbours are those of Table Bay, Algoa Bay, Buffalo Harbour, and Port Natal.

The total capital expenditure on harbours at 31st December 1913 was approximately £11,910,557, distributed as follows:—

	£
Table Bay - - -	3,857,893
Mossel Bay - - -	147,876
Algoa Bay - - -	1,419,238
Buffalo Harbour - - -	1,560,774
Port Natal - - -	3,927,430
Minor harbours, lighthouses, and expenses in connection with Loans - - - -	997,346
	£11,910,557

Information respecting the charges at the several harbours, together with particulars of shipping, traffic dealt with, &c., has already been furnished to the Commissioners, *vide* the Booklet issued by the Union Department of Commerce and Industries containing "Replies to questions as to the Natural Resources of "the Union of South Africa and the facilities for the "production, manufacture, and distribution of Articles "of Commerce."

A revision of the Harbour Tariffs is at present under consideration. The division of harbour working as between railways and harbours is also receiving attention, and it is hoped that it will be possible to transfer work that is at present performed by the Harbour Department to the control of railways, with beneficial results. At present the cost of loading, invoicing, &c., of goods at the harbours is borne by the Harbour Department, but it is contended that work of this nature is essentially railway work and should be eliminated from harbour working proper.

Annual Report—1913	19

W. W. Hoy,
General Manager.

Note.—In all cases in this memorandum in which tonnage is referred to, it is to be understood that the figures given represent tons of 2,000 lbs.

2261*a*. **(Mr. Tatlow.)** The whole of the railways and harbours in the Union of South Africa are now, with very few exceptions, the property of the Government?—Yes.

2262. And are administered and worked by the Government?—Yes.

2263. There is a Board consisting of three Commissioners with the Minister of Railways as chairman?—Yes.

2264. The Act of Union, I think, prescribes that, so far as may be, the total earnings of the railways shall not be more than are sufficient to meet the interest charges on capital, and the necessary outlays for working, maintenance, betterment, and so on?—Yes.

2265. And that the railways are to be worked on business principles?—Yes.

2266. There is also a provision, I think, that capital may be contributed out of railway and harbour revenue?—Yes.

2267. Since Union has capital been so contributed?—No, only before Union was capital so contributed.

2268. There is another provision, that receipts from railways and harbours shall be paid into a separate fund?—Yes.

2269. And withdrawals from that fund may be made for unforeseen expenditure?—Yes.

2270. Has any occasion yet arisen for that?—Yes, there was unforeseen expenditure last year covered by increased revenue.

2271. Has the Railway Administration any liability in the cost of raising capital by loans?—No. Money is obtained from the Government at a fixed rate of 3½ per cent. for interest from the time we receive it.

2272. The length of railways at the 31st December 1913 was 8,783¾ miles?—Yes, that includes private lines. The Union railways cover 8,231½ miles.

2273. You give the total, showing that the length of private lines worked by the Government was 218¼ miles?—Yes.

2274. And private lines not so worked?—334.

2275. So that of the total mileage in the country, the Government own and work about 97 per cent.?—Yes.

2276. What amount of double line have you?—132 miles of double track, 9 miles of treble, and 5 miles of quadruple.

2277. Where is the double line?—The mileage of double track is in small portions throughout the system, partly in the Cape Colony, in the Transvaal, and in Natal.

2278. I see the capital cost of the lines, including cost of providing rolling stock, is 82,574,580*l*.?—Yes.

2279. Which is equivalent to an average cost of about 10,000*l*. per mile?—Yes.

2280. Three and a half per cent. is the interest paid?—Yes.

2281. I see the interest for 1912 is only 2,619,470*l*. Is interest not paid on the whole of the capital?—Yes.

2282. Eighty-two millions at 3½ per cent. requires 2,890,000*l*. and the interest in your report is 2,619,470*l*.?—The interest you mention is for the year 1912. The capital of 82,000,000*l*. is the figure at the 31st of December 1913. Of course, we paid interest during construction of the lines in 1912, which, when the lines are opened, becomes a charge to Open Lines Working.

2283. But you only paid 2,619,470*l*. on the 82 millions, which is not 3½ per cent. It looks as if some of the capital does not bear interest from the railway revenues?—We pay interest monthly; that is, as we receive it from the Treasury. If we paid interest for the full twelve months on the money received during the year, the amount would be greater still.

2284. You say the features of the country traversed vary very considerably and that lines have been constructed in grades of 1 in 30. In view of that do you consider the cost of 10,000*l*. a mile a reasonable cost?—Yes, bearing in mind the adverse physical features of the country traversed.

2285. I see the grades are 1 in 40 and 1 in 30?—Yes.

2286. That is the gradient that rules the load?—Yes.

2287. Therefore, it does not conduce to economical working?—Well, the heavy sections, that is, where traffic is heavy, are confined to the main line in Natal and the eastern portion of the Transvaal between Pretoria and Delagoa Bay. The rest of the country, with the exception of the Hex River Pass, is comparatively easy, and perhaps you would like to know that in Natal, where the grade is 1 in 30, we shall have in a year or eighteen months' time, a grade of 1 in 65 south of Ladysmith and practically a double line from Mooi river to Durban.

2288. Does that mean the construction of a diverted line?—Yes. We are constructing about four deviations and improving grades and curves at a cost of 1,300,000*l*. approximately.

2289. You say the total mileage under construction at present is 250 at an estimated cost of 1,334,000*l*.?—Yes.

2290. Does that include cost of land?—Yes.

2291. What sort of lines are they? Are they spread over various parts of the country?—The lines under construction are mainly agricultural development lines, with the exception of those at Koffyfontein and Messina. These are for mineral development.

2292. They are spread over the country pretty well?—Yes.

2293. Are they new lines or continuations of present branches?—Some are continuations and some are projected from the main line.

2294. Are these 3 feet 6 inches gauge?—Yes, practically all.

2295. Unless, I suppose, in cases of a continuation of an existing gauge?—Yes.

2296. Do you favour the 3 feet 6 inches gauge compared with the other?—Yes, but of light construction where necessary.

2297. Who determines the location of these lines?—The Engineer-in-Chief.

2298. And yourself?—Yes, subject to the approval of myself and the Railway Board.

2299. Are they initiated by the railway management?—The construction is initiated by the Government, reported on by the Railway Board to the Government, and a report submitted to Parliament.

2300. In regard to those lines which are for the purpose of developing agriculture, are any of them in districts where it is probable that they will not pay for some time?—Yes, in some cases.

2301. In such cases does the district contribute anything towards the cost?—Only in one case, that is the line between Wolseley and Ceres, about 10 miles.

2302. Then you say that, in addition to the mileage under construction, a number of new lines have been authorised amounting to 794 miles at an estimated cost of 2,700,000*l*.; that works out at 3,440*l*. per mile?—Yes.

2303. Why is that so low?—Last year the lines introduced to Parliament were subjected to a very careful examination by the Minister and the Board, the standard of the lines was reduced so as to be more in keeping with the traffic expected to be carried and the estimated cost in consequence was considerably reduced as compared with the previous estimates.

2304. If the lines now under construction had been subjected to the same criticism, would the estimates for them also have been reduced?—Yes. I think so. I would like to mention that the cost of our lighter lines has been on a standard too high for a line in its early stages of development.

2305. You are building the lines in such a way as is really only necessary to carry the traffic for some time to come?—Yes, certain narrow gauge lines, for instance, cost 2,500*l.* to 3,000*l.* per mile; certain other broad gauge, or rather, 3 feet 6 inches gauge, lines cost 2,400*l.* to 3,000*l.* per mile, and the average last year of light and standard lines was brought down to 3,400*l.* per mile.

2306. What weight of rails do you use for these new lines?—Second-hand rails, 60 lbs. to the yard, generally taken from the main lines which are being relaid.

2307. In that case how do you appraise the value; do you deduct a certain amount for wear from the weight?—Yes, the value of the 60-lb. rail is taken and the difference between value of the 60-lb. and the 80-lb. rail is charged to capital account, the balance to renewals, and labour charges to working.

2308. But if you use a 60-lb. rail on the branch lines which has been used for twenty years, I presume you deduct a portion of its value?—Yes.

2309. That helps to reduce the cost of these lines?—Yes.

2310. Now you say the policy of the construction of these new lines is to make them as cheaply as possible compatible with safety?—Yes.

2311. Who is the arbiter of safety?—The Engineer-in-Chief.

2312. You have no Government control over that?—No. The line is subject to the examination of two authorities—the engineer who constructs and the engineer of open lines. Both engineers, together with the operating officer, inspect all new lines before they are taken over, and any matter which the maintenance engineer has occasion to call attention to must be reported upon then.

2313. Do you signal these new lines?—They have been signalled in the past, but in regard to these branch lines it is not the intention in future to signal them until the traffic justifies it.

2314. Are there no signals?—Only at junction stations or at any station where the approach is dangerous.

2315. Do you work them on a time system?—By a telegraph paper order, that is for trains to proceed.

2316. Not by the train staff?—No, except on busy lines. We work them by telegraph or telephone.

2317. Does that apply generally to your system, taking the whole of your railways in the Union?—The larger portion.

2318. What portion is worked upon, say, the electric train staff system?—I should say 80 per cent.

2319. You do not regard it as necessary for these newer lines?—No, not with one train per day, or three trains per week in each direction.

2320. I understand you are renewing your permanent way considerably for the purpose of meeting the increased weight of locomotives and rolling stock?—Yes.

2321. With an 80-lb. rail?—Yes.

2322. Is that the heaviest you use?—No, we have a short section of about 10 miles on the Wynberg line laid with 100-lb. rails, but 80 lb. is the standard on the main lines.

2323. Is it a flanged rail?—Yes.

2324. In regard to sleepers, are you growing your own to any extent?—Yes, we have large forests. In two years the Administration hopes to benefit by sleepers from our own forests. We obtain about 300,000 sleepers from the Knysna Forest, which is a Government forest. The Administration spends at the rate of 25,000*l.* per annum in tree planting for sleeper purposes.

2325. And do you anticipate great economies in future from this?—Yes. The price of sleepers is increasing at such a rate that the Administration anticipates the necessity of purchasing steel sleepers to some extent, but for our heavy main lines and particularly the curved portions we prefer a hard wood sleeper track.

2326. Do you consider that a great economy is possible in future by growing your own wood for sleepers?—Yes, I do.

2327. What do imported sleepers cost?—6*s.* 9*d.*, 6*s.* 10*d.*, and 6*s.* 11*d.*

2328. Have you formed any estimate as to what you can produce home-grown sleepers for?—No. It is rather early to take figures as to the cost of obtaining sleepers from our own plantations, but we require for maintenance purposes about 500,000 sleepers per annum.

2329. What is the average life of steel rails in this country?—Thirty years. In busy sections we may only have a rail last eight months, but thirty years is the general average. Certain lines vary from one year to three years, on the worst parts, where the traffic is heavy. Many sections, such as the lower part of the Natal line, have to be renewed every eighteen months.

2330. But the rails have a longer life before them on the branch lines?—Yes.

2331. Is the renewal of lines operating very heavily at the present time? Have the renewals been properly carried out in the past?—Yes.

2332. You have no undue burden upon you now in regard to renewals?—Since Union it has been heavy, because we have been practically compelled through increased traffic to lay the heavier rail on the main lines, and the endeavour has been to make the main lines a standard of 80 lbs.

2333. Does the strengthening of the road entail heavy expenditure?—Yes.

2334. You give a statement of the amount of rolling stock existing at the close of 1913:—Locomotives, 1,458; coaching stock, 2,472; wagon stock, 25,009, and you say there has been a steady increase in traffic since Union, necessitating the purchase of rolling stock in very large quantities, in fact since Union you have had a big increase in business, especially in tonnage?—Yes 4½ million tons increase.

2335. Is most of your additional rolling stock imported?—Yes.

2336. I suppose you do all the rebuilding?—Yes, we do that, and in future, I think, we shall be able to build about 85 passenger coaches and 750 goods wagons per annum in our own shops.

2337. Are you largely increasing the carrying capacity of your wagons?—Yes.

2338. What are the largest wagons you use?—50 tons.

2339. For the conveyance of what?—Principally coal.

2340. Have you many of those?—We have 50 in working at present and 200 on order.

2341. Can you get full loads for those wagons?—Yes, but I do not propose to urge the Administration to buy any more of those until I see the effect of the 200.

2342. Do you get loads both ways for those large wagons?—No, we cannot in Natal, we can partially in Delagoa Bay. I propose to use the large truck on the Natal line between the coal fields and the Point (Durban).

2343. Are you pretty well off with wagons to meet the requirements of the traffic?—Yes, we have increased our efficiency lately in the use of the wagons. I find that we do not get the use that we should get from our wagons. We have enough to cope with all requirements at the present time, but we have large orders due to arrive. In regard to shipping traffic we experience what other countries do, viz., that the coal is loaded as quickly as possible at the mines and sent off to the docks at which point it is shipped, but if the coal is not sold or the ships do not arrive, coal is left in the trucks. At Durban there is a coal bin with a capacity of 10,000 tons, but the Natal coal is very easily broken and we do not press the owners to place

the coal in the bins unless we are absolutely hard pressed; so that we usually have in Durban coal in trucks awaiting shipment to the extent of about 15,000 tons per day.

2344. Does that bin belong to the Administration?—Yes.

2345. Do you charge demurrage on the trucks?—No.

2346. Do you suffer much from the detention of wagons at the country stations?—Not much.

2347. On the whole you get a fair return from your rolling stock?—Yes.

2348. You say in your memorandum that the factor of the time which trains occupy in sections is now a very important consideration. I do not quite understand what you mean. Do you have lines so busy that the sections are too long?—Yes, some sections.

2349. That can be only on the busiest sections of the line?—Yes.

2350. That is why they are worked on the block system?—Yes, and the Tyers staff.

2351. Do the short sections cause much delay?—At present they do.

2352. What distances are your sections?—In southern Natal 3½ miles—our average section is 5 miles—this we vary from 7 to 15 miles and, in exceptional cases, from 15 even to 40 miles.

2353. You next deal with the question of staff and you give the total figures as 62,666, of which there are 32,356 Europeans and 30,310 natives, Indians and coloured persons?—Yes.

2354. The wages total 6,500,000*l.*?—Yes.

2355. Can you say how much is paid to natives?—I can make a calculation, but I would not like to state a definite figure off-hand. It is approximately 700,000*l.*

2356. Do all the coloured men occupy the lower positions?—They only do manual labour.

2357. Have you any coloured drivers, firemen, or signalmen?—No.

2358. Are there many men in temporary employment?—Only about 3,000 men in temporary employment on the railway.

2359. Does that include the number of men engaged on construction work as well as working the line?—Yes.

2360. Are the lines constructed by the Administration or by the outside contractors?—We have had one or two lines constructed by contract.

2361. How many would be engaged in working the railway?—Say about 31,000. There are about 617 whites and 1,080 natives on construction works. I should also make it quite clear that although construction is done departmentally many of the smaller sections are let out to contract.

2362. I was rather struck with the figure 6,500,000*l.* paid in salaries and wages, because your total expenses are 8,964,000*l.* and, therefore, the wages represent 80 per cent. of the total. It shows an enormous proportion of the total expenditure paid in wages?—Included in the 6,500,000*l.* is wages that are paid for new works and construction that are charged to capital account. Only a portion of 6,500,000*l.* is charged to Open Lines. You will find in my statement the figure of working expenses per cent. of earnings, which is 72·4 per cent., but if you deduct the cost in connection with relaying and depreciation the figure works out at 61 per cent., and if, again, you allow for the reduction on railway rates, then the percentage would be 55 per cent., which is the same figure as it was in 1909. Then another item which probably should be considered in connection with the profits of the railway and which has disturbed seriously our position is the fact that we have surrendered since Union 1,336,500*l.* in revenue by rate reductions; interest contributed to the Government on the 13,000,000*l.* of capital derived from revenue before Union representing a payment annually of 455,000*l.*; increases paid to staff represent 900,000*l.*, interest on capital expenditure since Union 128,000*l.*, increased contribution to depreciation 500,000*l.*, loss on opening new lines 300,000*l.* contribution to deficiency in pension funds 50,000*l.* per annum, and increased working expenditure due principally to increased traffic 680,000*l.*, altogether making a total of over 4½ millions, from which we must deduct the decreases in contributions for betterment rates and revenue from additional traffic.

2363. You have done a great deal more work for less money?—Yes.

2364. But the fact remains that you have spent a very large amount in wages?—Yes, our wages are, I think, the highest in the world.

2365. In regard to the conditions of employment for the staff, we need not go into that as you have handed in your printed regulations and conditions?—Yes.

2366. You say that the entrants into service are compelled to become members of the superannuation and sick funds?—Yes.

2367. Does that mean that all the staff belong to both funds?—Yes, all new entrants who are on the permanent staff.

2368. Does the sick fund apply to the clerks?—Yes.

2369. And the superannuation fund?—It applies to all the permanent staff.

2370. I suppose the Government guarantees it?—They contribute on the basis of £ for £ by members.

2371. Is it governed by actuarial requirements?—It is subjected to an actuarial examination every five years.

2372. And if the actuaries discover that it is not sound, what happens?—The contributions from the staff and the administration would have to be adjusted, but the total cost of administering the funds is borne by the Administration. That represents roughly from 5,000*l.* to 10,000*l.* per annum.

2373. In regard to stores—the total quantity in hand on the 31st December 1912 was 1¾ millions, roughly, and 4,630,000*l.* worth purchased during the year; the total quantity of coal purchased was 1,675,128 tons at an average cost of 4*s.* 11½*d.* a ton at the pit head?—Yes.

2374. Is it carried free on rails?—Yes.

2375. Do you use any imported coal?—No.

2376. Coal is imported, I understand?—Yes, but not by the railway.

2377. For what purpose is it imported?—For shipping, and a little is imported into Cape Town. The recent importations have been occasioned by the strike.

2378. That is a great advantage you have in this country, such cheap coal, and it is an important factor?—Yes.

2379. Is it good steam coal?—Yes.

2380. How does it compare with South Wales coal?—Natal coal is almost equal to South Wales coal and Transvaal coal is about 12 per cent. lower in value than Natal.

2381. The entire control of the railways is in the hands of the General Manager, who has three Assistant General Managers controlling separate systems?—Yes.

2382. Are they in charge of everything and everybody in those districts?—Yes.

2383. Including the district engineers?—Yes.

2384. Then you divide the railway into three branches—technical, commercial, and operative?—Yes.

2385. That is rather on the American system?—Yes.

2386. Is that the system adopted since Union?—No, in the Transvaal and the Free State it was adopted prior to the Union.

2387. Does it work well?—Very satisfactorily.

2388. Does the operating department include the controlling of the locomotive running?—Yes.

2389. Then the engineers otherwise are simply mechanical engineers?—Yes. The advantage of that is that you have only one office at any of the depôts and you have only one officer, whether he be the Assistant General Manager or the Divisional Superin-

tendent. There is only one office, and you avoid unnecessary correspondence between the different subordinate officers.

2390. I think your last published report deals with the year 1912?—Yes.

2391. But these figures you have produced now are the 1913 figures?—Yes.

2392. The gross earnings appear to be 12,388,000*l.*?—Yes.

2393. And the gross expenditure 8,964,000*l.*?—Yes.

2394. The net earnings being 3,424,000*l.*, which represents 4·2*l.* per cent. on the capital?—Yes.

2395. And you have only had to pay 3½ per cent. and the balance has been available for other purposes?—Yes.

2396–7. That is the principle you are now working under?—Yes. I do not know whether it would be of interest to the Commission to give you a classification of the earnings?

2398. Yes. I have a note here that your passenger receipts are only 20 per cent. of the gross earnings?—Yes. Passengers represent 3,377,243*l.*, or roughly 27 per cent. Parcels, 361,017*l.*, or 3 per cent. Goods, 6,044,613*l.*, or 49 per cent. Coal, 1,890,799*l.*, or 15 per cent. Live stock, 379,287*l.*, or 3 per cent. Miscellaneous, 335,796*l.*, or 3 per cent.

2399. The live-stock traffic is small?—No, it is heavy considering the size of the population. The traffic represents in large stock for the year, 523,719 head of cattle, and in small stock, 2,669,266 head.

2400. Is it a growing trade?—Yes: of course, the rates are very low.

2401. What is the movement of it, generally speaking? Is it for exportation?—No, it is in the direction of Johannesburg and Cape Town for slaughter purposes generally, but we shall be exporting very soon—I think in a year or eighteen months.

2402. Is there any revenue received for carriage of mails?—Yes, we get a fixed sum from the Government.

2403. You give your earnings per mile at 1,550*l.*?—Yes.

2404. Which is quite good, but your gross expenditure is 72 per cent.?—Yes, but that includes a number of special items such as I have mentioned.

2405. And you have a note here to say that these figures do not include the result of working the subsidiary services such as catering?—No, there is a separate account for that; we do not treat it as a part of the general account of the railways.

2406. You do all the catering yourselves, I understand?—Yes, except the refreshment rooms in Natal.

2407. What other subsidiary services are there?—Cartage, bookstalls, and advertisements.

2408. You run your own bookstalls?—Yes, except in the smaller places.

2409. You make a comparison of the result of working for the year 1913 compared with 1909, which shows that the gross earnings have increased by 18·49 per cent., and the gross expenditure by 57·95 per cent. The gross earnings have increased, I see, by 18½ per cent. To what extent during that period has the mileage increased—open mileage?—By 338 miles per annum for the four years. The passenger traffic has increased by 15 millions, representing 53 per cent.; goods tonnage has increased by 4½ millions, representing 43 per cent., and the train mileage by 10½ millions.

2410. Does that mean that while your passenger traffic has increased so largely in numbers you have had a reduction in the passenger fares?—Yes.

2411. And also in the goods rates?—Yes.

2412. You make an explanation of that here?—Yes.

2413. Wages and salaries are 900,000*l.* per annum more than they were at Union?—Yes.

2414. Since Union came about, acting on the principle contained in the Act of Union, you have been making considerable reductions in the rates?—Yes.

2415. Every year?—We have not reduced this year to any extent.

2416. Did not the surplus revenue allow of it?—No, the increased depreciation and the increased interest charges and particularly the increased payments to the staff leave us rather on the wrong side of the ledger for the present.

2417. In 1912 your reductions amounted to something like three-quarters of a million?—Yes, 750,000*l.*

2418. In making those reductions what principles do you follow; has it been necessary since the union of the railways to make any great revision in the rates?—Yes, we had to assimilate the local rates in the Cape Province, which was the largest Province and had the largest mileage, and we had to adjust the Cape local rates and bring them into conformity with the classification in the other Colonies. That meant a surrender of revenue of 450,000*l.*

2419. You had to classify the rates in four Provinces on a similar basis?—Yes.

2420. Is it assimilated now?—Yes.

2421. Is it one classification?—Yes. It is one scale and one classification.

2422. Do you follow the English classification?—Yes, in principle. We have 16 classes, but some are very closely allied.

2423. Have you a different classification for through traffic from that for local traffic?—No, the classification is the same, but the rates are different

2424. Have you different rates for imported manufactured goods as compared with articles of local manufacture?—We have differential rates now.

2425. We were told yesterday by Mr. Solomon that there were preferential rates on local manufactures?—Yes, there are about 26 of such cases left.

2426. Have the others been eliminated?—Yes. But if we had attempted to deal with these we would have disturbed the industries of the country. The number of classes which received the benefit of preferential rates has been reduced from 150 to 26.

2427. Will those 26 remain?—They will disappear, but I do not think immediately.

2428. Is it a matter of gaining revenue?—No, the reason is that we regard the principle as a wrong one.

2429. As a railway administration, if you haul goods you should receive the proper payment for those services?—Yes.

2430. On the business principles laid down in the Act of Union?—Yes. Any protection that may be necessary for local industries must be done in some other way.

2431. That will gradually be adjusted?—Yes.

2432. Then in regard to the rate for mealies, I see in your report for 1912 you say the local rate for mealies has been reduced to a maximum of 20*s.*?—Yes.

2433. But one witness said yesterday that the rate for mealies was ten shillings—a flat rate?—Yes, for export maize.

2434. He said it applied internally?—No, it does not.

2435. But you have lower rates for export?—Yes, for short distances, but the maximum flat rate is ten shillings per ton.

2436. Has that done good?—Yes, I think it has stimulated the growing of mealies and assisted in the development of the country. Unfortunately, for two years in succession there has been drought, and the maize crops have not been as large as we expected. That will also be the case this year.

2437. Do you have specially low rates for export traffic?—Yes, for base ores, for coal, and for export fruit and for grain.

2438. Are those of recent adoption?—No: they were adopted before Union.

2439. On page 19 of your report you give a list of goods on which the rates were reduced in 1912. Have you found that has benefited the consumer? Has he reaped the benefit of that?—The consumer will derive the benefit of the reduced rates, because the rates recently reduced were on rough articles such as galvanised iron and timber, and heavy building

lines, and the object of that was that the people who used these materials would get the benefit. If we made a reduction on the high-priced articles, even foodstuffs, the probability is that the reduction would not reach the consumer immediately, and the Administration decided to make it on the articles which were generally used in the country for industrial purposes.

2440. You have got here, cement, paraffin oil, agricultural machinery, galvanised iron, plain timber, fencing material?—Yes, all necessary for the development of a young country.

2441. Those are the principal items to which reductions have been applied?—Yes. The livestock rates were also reduced by 30,000*l*.

2442. The total tonnage for 1913, you say, is the highest on record?—Yes.

2443. Is all the tonnage calculated on the short ton of 2,000 lbs.?—Yes.

2444. Is that what you use in working the railways?—Yes. We use the long ton in connection with shipping.

2445. Then you append a statement showing the financial results for the year 1913 and for each year since Union, or rather since 1909. Next you speak of rates and fares, and you give a table of your rates and fares—first, second, and third class. Those seem very reasonable fares. Since Union has this scale been reduced?—We reduced the passenger fares immediately after Union 150,000*l*.

2446. Are any of the fares reduced below this scale?—Only the suburban fares, for traffic such as between Cape Town, Wynberg, and Muizenberg.

2447. Are three classes a suitable division of the passenger traffic in this country?—I do not think so.

2448. Do you favour two classes only?—Yes, and we shall ultimately, I think, approximate to it.

2449. I suppose on the score of economy?—Yes, because our distances are long and the grades heavy.

2450. You have another class, natives?—Yes, by certain trains.

2451. You would practically, even then, have three?—Yes, we have four at present. I propose that the second class should disappear.

2452. Do you look forward to further economies in that direction?—Yes, owing to the reduction of dead weight, and shorter and faster trains.

2453. Do you do anything for commercial travellers?—Yes, they travel on the mileage system. They take advantage of the system of coupons and obtain reduced rates on their luggage.

2454. Do you limit them to distance?—No, we give them as many miles as they like.

2455. You do not charge terminals on goods traffic?—Except in one or two cases.

2456. You do not include it in the rate?—In a few cases only.

2457. You say you have brought the charge down to ·187*d*. per ton per mile for small livestock?—Yes.

2458. Do you charge by weight?—No, per head.

2459. But you say per ton?—For the purposes of arriving at the tonnage, we convert the head of stock into dead weight on a fixed basis.

2460. What distances do you carry livestock?—Roughly from five to seven hundred miles in one direction and about five hundred miles in the other.

2461. Then you refer to the harbours, and you say they are controlled by the General Manager in conjunction with the railways, the principal harbours being Table Bay, Algoa Bay, Buffalo Harbour, and Port Natal, and you give the total capital cost as 11,910,000*l*., and add that information in respect to the charges of the several harbours, together with the shipping traffic, are being furnished to the Commission?—Yes.

2462. You also refer to the revision of the harbour tariffs at present under consideration. Does that mean adopting uniform charges?—Yes, and with the object of making the harbours pay.

2463. You think there is at present some waste in the management of the harbours, or that the working of the railways and harbours overlaps?—No; the loss occurring is principally due to the heavy depreciation charges made since Union. The object is to establish uniform rates applicable to all Union harbours and make the revenue meet expenditure, the rate being calculated so as to make the harbours pay as a whole.

2464. Do you not contemplate something in the way of greater efficiency and economy in the method of working?—Yes; we propose to transfer the land portion of the harbours to the railways, so that invoicing and loading will be part of the railway work. At present it is administered by the Harbour Department.

2465. Do you mean to say that the shunting is done by the Harbours Department?—Yes, at present. It should be under the railways: in several cases we have two employees instead of one.

2466. Do you anticipate any substantial economy from that change?—I think so. We have made substantial economies already.

2467. That has engaged attention already?—Yes.

2468. Then, finally, you submit eight tables* and a number of books which contain practically everything regarding the railways and harbours and their working. I should like to draw attention to statement number 1. You have compared the years 1909, 1910, 1911, 1912, and 1913?—Yes.

2469. And comparing 1913 and 1909, the gross earnings show an increase of nearly two millions?—Yes.

2470. The gross expenditure over three millions?—Yes.

2471. And the passenger traffic has increased in numbers by 15 million passengers?—Yes.

2472. The tonnage has enormously increased—over 4½ millions?—Yes.

2473. The earnings per train mile, notwithstanding that great traffic, have decreased by 2·5*d*.?—Yes; that is due to the reduction of rates.

2474. And also by giving a better train service?—We have increased the train miles by about 10 millions.

2475. In other words, by about 54 per cent.?—That is so.

2476. Is that largely occasioned by great increase in the cheap and bulky traffic conveyed?—Yes. We have increased the passenger traffic 53 per cent. and the goods 43 per cent.

2477. Coal has figured largely in that?—Yes.

2478. And then the final statement is very interesting (number 8), in which you give the traffic carried during 1912 and 1913, classified according to specific commodities, and the first thing that strikes one there is the item of machinery—agricultural machinery and implements—which shows an increase of 43 per cent.?—Yes.

2479. Fencing material 21 per cent.?—Yes.

2480. Fertilisers 98 per cent. All this speaks well for agricultural development. Fruit, 10 per cent.; grain a very large increase. In timber you have a decrease in the imported article, and a large increase in the South African article?—Yes, we are using more South African timber.

2481. Is it in bunker traffic that the coal traffic has so largely developed?—Yes.

2482. Is the increase the result of a reduction of the rate?—Yes, largely the export of coal. We have reduced the rate 1*s*. a ton on coal exported.

2483. What is your maximum coal rate?—The coal rate for export purposes varies from ·29 to ·24 of a penny per ton mile from the mines to the nearest ports, between 200 and 300 miles distant.

2484. In shillings and pence?—4*s*. 11*d*. per short ton. We have reduced the rate on Transvaal coal to Cape Town for bunkering from 3*l*. to 13*s*.

2485. These figures show that while your railway business has largely developed your rates have been

* *See* Appendix H., p. 146.

consistently reduced, and with the exception of the year 1913 you have had a very large surplus to devote to the reduction of rates?—That is so.

2486. And you hope in a short space of time to have all the rates assimilated to a fair basis on the whole system?—Yes.

2487. And have all the preferential rates discontinued without exception?—Yes.

2488. **(Mr. Lorimer.)** I have only a few questions to ask, but I specially wish to be short. I understand your system of depreciation differs from the practice of the English railways. They, of course, have suspense accounts for special renewals, and general reserve funds, and they can draw on them for anything they like. As I understand it, yours is established on a different principle. I understand that what you do is this: You debit the revenue of each year with all expenditure incurred for ordinary wear and tear for maintenance of permanent way, stations, buildings, and so on, and for maintenance and repairs of rolling stock?—Yes, that is correct.

2489. But in addition to that you debit revenue and credit a betterment and depreciation fund with certain large sums which I understand are used to pay for special renewals or replacements, the cost of which might very well be a perfectly excessive charge against the revenue account of the year in which the expenditure was incurred. Is that right?—We have two special accounts. One is a Renewals Fund Account, and the other is a Betterment Fund Account. In addition to the contribution of 1,700,000*l.* to the Renewals Fund we contribute from revenue a sum of 100,000*l.* to Betterment Fund. The sum of 1,700,000*l.* is arrived at on a percentage basis on the life of rails, buildings, bridges, signals, and so on, and with regard to rolling stock it is calculated at the rate of 5 per cent. on locomotives, and 4 per cent. on coaching stock, and 4 per cent. on goods stock, and 6⅔ on machinery.

2490. Is that statutory? Do you require to adhere to it?—No, this is not statutory. This is a schedule prepared by the Administration and approved by the Railway Board, and we are working to that at present.

2491. But it is always open to you to revise it?—Yes, and, of course, the items appear in the Estimates and are criticised by Parliament annually.

2492. I have a Betterment Fund here and the total deducted from revenue on the 31st December 1912 was 4,461,997*l.*, out of which you appear to have paid for capital expenditure 3,791,000*l.*, leaving to the credit of the fund 670,000*l.*?—Yes.

2493. For the charges on permanent way and rolling stock for renewals how much would the charge average?—The Betterment Fund is an arbitrary fund. We only pay in what we can afford. For the last year we paid out about 800,000*l.* for rolling stock, and this next year we shall pay out probably about 650,000*l.*

2494. How long has this fund been in existence?—It has been in existence in the Transvaal and Free State since 1905, and since the union of the Provinces it has been made applicable throughout.

2495. How much double line have you?—132 miles.

2496. You have a most appalling list of gradients. Do you know what is the percentage of coast lines with these heavy gradients to the inland lines with moderate gradients?—No, I think I could work it out if you wish.*

2497. Necessarily, with gradients like these, you require very powerful locomotives?—Yes.

2498. And I think I may say that there is nothing in the world to equal South African locomotives on the 3 feet 6 inches line?—Yes, that is so.

2499. And I see that the tractive power of every new lot is greater than the preceding lot?—Yes.

2500. Do these locomotives dispense with double heading?—Yes, mainly, but not entirely. In the last ten years we have increased our load practically from 300 tons in some cases to 1,600 tons, and we have been up as high as 2,000 tons.

2501. On what gradient?—1 in 60.

2502. At what speed can you run on that?—About 10 miles an hour.

2503. In regard to working expenses in relation to revenue I see your explanations of this increase. There is an alarming increase from 54 to 72 per cent. in working expenses, but there is more than the reduction in revenue to account for that increase. I take your figures of revenue for 1913 and add 1½ millions to it as approximately what you surrendered, and I find that the working expenses were over 65 per cent.?—Yes.

2504. Your figure is 72, but even with the old rates of revenue the expenses were 65 per cent. I suppose that is on account of the high rate of wages?—Not altogether. If you take our full reduction in rates, the additional cost charged to working by increased wages and renewals and the additional interest charges and additional depreciation paid, you will find that the working expenditure will approximate to 55 per cent., the same as it was in 1909.

2505. I suppose wages are rising all the time?—Yes.

2506. Now suppose you reach a point when you begin to encroach upon the interest, could you take anything out of your betterment fund? You can simply reduce it, I suppose. I mean, suppose your working expenses increased at such a ratio that they encroached on your ability to pay the full interest and you had a considerable balance at the credit of your betterment fund, could you use that?—With the consent of Parliament.

2507. Has the capital which went to pay for the building of the railways been raised at something like 3½ per cent.?—Yes, we pay 3½.

2508. Do the Government pay 3½?—They raised it at a little more than that on an average, but recently the rate of interest has been higher.

2509. Is there much of that capital on terminable loans?—Yes.

2510. So that as these expire it is possible you will have to pay more?—Yes, that is to say, the Government will pay more.

2511. I see you say that coal costs 4*s.* 11½*d.* a ton?—Yes, on an average.

2512. That is free of railway carriage?—Yes.

2513. That raises a question. You carry an enormous amount of railway material free?—Yes, coal for loco. requirements. Material for construction purposes we charge ¼*d.* per ton per mile.

2514. You have in one of these tables the tonnage hauled free, which is equal to 16 per cent. of the whole?—Yes, 2,313,167 tons.

2515. Sixteen per cent. of the whole?—Yes.

2516. And you do that year by year?—Yes.

2517. And I suppose you would very well afford to pay carriage on coal if you got credit for the haulage of 2,313,167 tons?—That would be the departmental charge.

2518. So it hardly gives you all the credit that is due?—No.

2519. There is only one other table that I want you to speak about, and I congratulate you on it, that is the table of train mileage. You have a very much larger percentage of productive to unproductive mileage than is the case with the English railways?—Yes, our unproductive mileage is only 22 per cent. of the total.

2520. I do not refer to branch lines, but to the difference between train mileage and engine mileage. How do you explain it? Is it the longer hauls?—Yes.

2521. And you have very little double heading?—That is so.

2522. And not very much empty running?—No.

* The witness subsequently supplied the following information:—The percentage of coast lines with heavy gradients to the total of all lines is approximately 40 per cent., that is to say, there are roughly 3 miles of inland lines with moderate grades to every 2 miles of coastal lines with heavy gradients.

2523. I think these figures are extremely satisfactory.

2523*a*. **(Mr. Campbell.)** What is the reason for charging ½*d*. a ton on the carriage of coal to Durban and one-sixth of a penny per ton to Cape Town? Is that a matter of policy on the part of the railways?—The principle is exactly the same as before Union. Before Union in Natal they had two rates, one for coal for local consumpton and the other for coal for bunker and export purposes. The rate for coal for local consumption approximated to ½*d*. per ton per mile and the rate on coal for shipment varied from ·265 to ·296 of a penny per short ton per mile to the Point. The principle has been continued and we charge on a sliding scale throughout, so that 240 miles represent 6*s*. 8*d*. per ton of 2,240 lbs. for bunkering, and 5*s*. 6½*d*. for export. Then the reason for the ·16 rate at Cape Town is that the rate was fixed to secure the traffic.

2524. Is the cheap rate to Cape Town intended to give facilities for supplying consumers with coal?—Yes. In 1909, we bunkered at Cape Town, for instance, 58,000 tons, and in 1912 it rose to 355,516 tons, and for last year it was 282,622 tons. Now, formerly, most of that coal came from other parts of the world. It is now almost entirely supplied from the Transvaal and Natal.

2525. **(Sir Alfred Bateman.)** About seven years ago the Shipping Rings Commission had some evidence before them that the cost of living in the Transvaal was increased more by the rates on the railways than by the freights of the shipping companies?—Yes.

2526. Is that true now?—I do not think so.

2527. Can you prove it is not?—I think the cost of living is made high in this country by the wages paid to the men. I think the cost of living is more affected by the higher rates of pay obtained by men for their work.

2528. Can you give me an idea what reductions you have made?—We have made reductions in rates of 1,336,000*l*. per annum.

2529. Would it be a reduction of 50 per cent.?—No.

2530. Twenty-five per cent., then?—No, it would be very difficult to say what it would represent. You might take it in this way. The total revenue is over 12 millions and the total reduction represents 1,336,000*l*. per annum. So it equals a little over one-twelfth.

2531. That is to say, 8 or 9 per cent.?—Yes.

2532. Have you done away with all these carefully regulated divisions of traffic imports?—No, they still exist.

2533. So as to give Durban 30 per cent., and so on?—Yes. It is regulated by an agreement taken over at the date of Union, and it will be in operation for another five years.

2534. That is rather embarrassing to you in calculating your rates?—Yes. But in five years the matter will be reviewed.

2535. Is that in connection with the Mozambique Government as well?—Yes.

2536. You will have to wait that time to get free unless you get free by the consent of all?—Yes.

2537. The livestock traffic for export is free, is it not?—Of Customs, yes.

2538. You have livestock in these tables taken separately from your revenue. We know that railway coal and stores are conveyed free. Is livestock free?—No.

2539. This revenue of 388,000*l*. is actually paid?—Yes.

2540. It is a little ambiguous?—Yes, the introductory paragraph is misleading.

2541. Livestock, if I remember, pays a very low freight?—Yes.

2542. **(Sir Jan Langerman.)** We have now had Union about four years?—Yes.

2543. How long is it since you reduced the rates from the Transvaal on coal?—In 1912. We reduced the rates on coal by 200,000*l*. per annum.

2544. What is the immediate reason?—To afford a cheaper rate on Transvaal coal to the goldfields and to the ports for shipment.

2545. What is the reason, really? Was it very expensive bunkering here at that time?—Only English and Natal coals were used at that time, and we reduced the rate to 15*s*. 3*d*. in the Cape, and we found that in 1912 the rate for coal—that is Natal coal—was 23*s*., but in 1913 it was increased to 26*s*. at Cape Town.

2546. Is that because there was no competition from the Transvaal?—Yes, and the coal interests were in the hands of one combination.

2547. That practically created a monopoly?—They had something like a monopoly.

2548. The Government intervened and broke that up?—Yes.

2549. And that is the practical result?—Yes.

2550. I see the Government does not charge the railways with the cost of raising the money. Is that fixed by the Act?—Yes. We pay to the Government 3½ per cent.

2551. Do you not think it should be a legitimate charge against the railways?—Well, it cuts both ways. If they raise money at less than 3½ per cent. we still have to pay 3½ per cent.

2552. Now, in regard to the mileage, the new line costs 3,400*l*. per mile?—Yes.

2553. How is it that the cost of our railways stands at 10,000*l*. a mile?—Because many of the sections cost 16,000*l*. a mile. Some sections of the Delagoa Bay line cost 15,000*l*., and some sections of the Natal line cost 16,000*l*., but the average cost of the whole works out at 10,000*l*.

2554. There are no accumulations for betterment or maintenance added to it?—No, that is the actual cost.

2555. **(Chairman.)** You attach great importance to the provision of cheap bunker coal at Cape Town and Durban?—Yes.

2556. Do you see any possibility of reducing the charges still further?—Not at present.

2557. When you get your gradients improved in Natal and the other improvements in rolling-stock, is it conceivable that you will be able to go still further in reduction of rates?—Yes.

2557A. In regard to Cape Town harbour, we went over the harbour the other day with the engineer, who pointed out a large programme for improvement for which a small portion has been provided with funds?—Yes.

2558. How soon do you hope to carry through the programme, or so much of it as will give a depth of 40 feet?—Two or three years.

2559. You intend to push on as rapidly as possible?—Yes.

2560. And the provision of a second basin, when?—If the trade indicates the necessity for further extension as we near the completion of the present works we will take the other into consideration. We shall be able to anticipate our business.

2561. But as far as the provision for ships of the largest tonnage and most modern type is concerned, we may take it that accommodation will be ready in two years?—Yes.

2562. Forty feet of depth and the length of 800 feet?—Yes.

2563. In regard to the improved facilities for bringing Natal coal to the coast, when these corrections of gradient and curve have been made, will that justify a further reduction of rates?—Well, the export coal rate is very low now. It is 4*s*. 11*d*. for Natal and 13*s*. at Cape Town per short ton.

2564. But your cost of haulage, I imagine, will be very largely reduced by these changes?—Yes.

2565. What can you tell us about the alternative line for coal in Natal. Is there any intention of putting it through?—There will be no necessity. We shall have practically a double line from Maritzburg to Durban.

2566. And that will give you all the capacity that you require?—Yes. It will increase the capacity of the line by more than 100 per cent., and not increase the working costs so far as station expenses are concerned.

2567. Are any large improvements in contemplation on the haul from Delagoa Bay to Johannesburg?—Only in a very preliminary stage at present. We have regraded the line from Komati Poort to Waterval Boven and obtained a grade of one in fifty, and on the western side of Waterval Boven there are certain other improvements in the preliminary stage.

2568. Is there any rack and pinion on that line?—No, we have a ruling grade of one in fifty from Komati Poort to Waterval Boven.

2569. In regard to electrification, have you any scheme in contemplation either for mountain sections or suburban sections?—We have about four schemes under consideration, one for the Cape Town to Wynberg section, one for the Cape Town to Sea Point section, another for the Randfontein to Springs section at Johannesburg, and one from Komati Poort to Waterval Boven, and I have also, in the report submitted to the Railway Board, urged that the question of electrifying the line between Durban and Maritzburg, and probably the whole of the Natal main line from Durban to Hatting Spruit, should be looked into, because these sections seem to me to be admirably suited for electrification.

2570. Can you form any idea of the cost of electrifying those sections?—Yes. But the figure is not very safe, because when the figures were taken some years ago the position was different. The cost of obtaining power is now much less, but the figures then given for the four sections were in the neighbourhood of 1,000,000*l.*

2571. Including the Natal section?—No. The reason why that has not been looked into is because it is a heavier problem. The coal is cheap there, the traffic heavier, the gradients are heavy, and electric power would be much easier and cheaper to use on a difficult line like that, because the maintenance charges would be reduced.

2572. If you have any figures on electrification, I should be glad if you would put them in?—I have some reports.*

2573. On the Natal section?—No. That is only a recommendation which I have made for the purpose of instituting an inquiry.

2574. Have you in force or in contemplation any special scheme for attracting tourist traffic from the Mother Country or elsewhere? Yes, we have circular tickets issued by the shipping companies or by Cook and Sons by which a passenger can travel over our railways and make arrangements before he leaves England.

Not reproduced.

2575. Is that traffic developing satisfactorily?—Yes, we hope to develop it much more.

2576. In your judgment, is the duration of the passage oversea a very considerable factor in retarding the development of this traffic?—I think the voyage itself will ultimately prove to enhance the attractions of the trip more than otherwise.

2577. Therefore, the longer the voyage the greater the attraction. One witness said that a reduction to 14 days would exercise a considerable attractive force?—I think that will come, but I do not think the tourists will be influenced by one or two days on probably a six months' journey.

2578. What can you tell the Commission in regard to the development of the Messina District with your new line. Do you expect a heavy traffic at once?—Yes, of copper ore at once, and it will enable additional coal and copper mines to be opened. The coal is not of very good quality, but it may serve for mining purposes.

2579. Is there a large copper-field?—Yes.

2580. Will that extension pay when it is opened?—It is guaranteed by the Messina Company to the extent of 4½ per cent. for ten years.

2581. We have heard something in the evidence regarding the absence of trucks in Natal. Is that matter in process of rectification?—The remedy is their own. They have constantly 15,000 tons of coal under load and it has even been as high as 21,000 tons per day. But we have had a large increase of rolling stock and we are ordering more, and I expect no further difficulty in regard to truckage.

2582. What have you to say about bunkering facilities at Cape Town and Durban?—At Durban, we have made provision for an additional coaling plant, which, when completed, will enable us to bunker at the increased rate of 400 tons per hour, and at Cape Town, I hope, with additional mechanical appliances, to reduce the cost by nearly one-half.

2583. From what to what?—From 2*s.* to 1*s.*

2584. Are there any complaints as to delay in coaling?—No. I think it has been rather the opposite. We have received a good many letters of commendation for prompt bunkering.

2585. **(Mr. Tatlow.)** Do you expect to long enjoy the advantage of being charged only 3½ per cent. interest on your capital?—I hope so.

2586. Is it a matter about which there is a difference of opinion?—I have a difference of opinion about the interest we pay. I think we pay 450,000*l.* per annum too much.

2587. But in regard to the rate of interest?—I think our loans will probably be raised in the neighbourhood of 3½ per cent. We have done it before and I do not see why we should not do it again.

Port Elizabeth, Friday, 13th March 1914.

Mr. William Edwin Clift, Port Captain and Marine Superintendent, and Mr. G. Holford Walker, Harbour Engineer, called and examined.

2588. **(Chairman.)** Mr. Clift, you have been good enough to give us details of your roadstead. Port Elizabeth is a roadstead in a large partly-protected bay?—Yes.

2589. What depth of water do you get within a moderate distance from the shore?—The best working anchorage is within 6½ fathoms, which is about half a mile from the jetty. You will see two lines on the chart where the mail boat anchors.

2590. You get there a shelving beach?—Yes.

2591. It runs from 6 fathoms to 7 or 8 fathoms?—Yes, anything outside 7 fathoms is out of the anchorage.

2592. Is it a good anchorage?—Excellent holding ground.

2593. What storms do you fear?—South-east gales, but they come very rarely, only about once every ten to fifteen years. Our ordinary south-east winds are nothing to worry about, but they hamper the work.

2594. Do these vessels often have to move away and put out to sea?—Very rarely. If a vessel feels that it is uncomfortably close it will move out a little further, but that is very seldom necessary.

2595. Is your work interrupted by bad weather many days in the year?—No, the complete stoppage

of work on working days does not average three a year. There are days on which we only work up to about 4 o'clock perhaps, but there is very rarely a day that we do not get a fair tonnage.

2596. Is there any considerable damage to goods owing to lighterage in heavy weather?—Only the damage due to double handling. We have an extra handling here.

2597. What is the cost of that extra handling compared with the cost of working cargo to the quay direct?—We have the cost of the lighterage, that is, 1*s.* 6*d.* a ton.

2598. That is the net additional cost?—Then we would have the cost of taking it on the quay. The men who are now on the lighters would be on the quay; that is, the men now in the lighters to handle the cargo on to the quay. The boating company used to get half a crown for that work, but the Government has bought the company out. Our lighterage cost is now roughly 1*s.* 5*d.* a ton, as far as I can ascertain.

2599. On all cargo?—That is rough and fine.

2599*a*. That is the only amount of extra cost involved through the absence of a quay, is it not?—Yes.

2600. What schemes are there for improvement?—There is a scheme for enclosing the port with a breakwater from the end of the Dom Pedro jetty. I have drawn a line on the chart which you have. We propose as a first instalment to add 1,000 to 1,500 feet of breakwater. That will go out to 6 fathoms. The idea is to have 130 acres of open water inside the breakwater in 6½ fathoms; that is, 39 to 40 feet, and then bring it round to an angle in the north, sheltering the present jetties, and making them workable. We could utilise them, and then go in for a scheme of improvement inside the harbour, after the breakwater was formed.

2601. What is the estimated cost of the breakwater?—1,500,000*l.*

2602. Has that scheme been submitted to the Government?—It has been before the Railway Board. I do not know that it has been submitted to the House.

2603. Has it been approved by the Railway Board?—I cannot say.

2604. Even if you had calm water along your present jetties, you would still have to lighter, owing to the shallowness of the water?—Yes, with many vessels, but not with all. I shall have a sailing ship along the jetty on Monday, drawing 20 feet 10 inches. That is the maximum. We have 21 feet at low water, but we have to allow for the swell.

2605. Are there any alternative schemes of development?—There was an alternative scheme for opening the Zwaartkops River, some 6 or 7 miles to the north, but I do not think that has been considered.

2606. That is outside Port Elizabeth?—No, it is in the bay.

2607. Has that scheme been abandoned in favour of the one you mentioned?—I do not know that it has been abandoned. Surveys have been made and soundings taken.

2608. What probability is there of either one or other of these schemes being put through?—I am afraid I could not say. It is for the Government to decide.

2609. What can you tell us regarding the development of the tonnage landed and shipped?—During the last five years there has been a practically 75 per cent. increase, from 440,000 tons to 710,000 tons.

2610. Can you at all distinguish between the local traffic and what is called the competitive areas traffic, that is, Johannesburg traffic?—No.

2611. Can you say what proportion is due to Johannesburg and what proportion to the other districts?—I could not tell you. That would come better from the Port Manager. I think the increase has been general right through. I do not think there has been so much on the Johannesburg traffic. I think it has been more on the local and the rougher traffic for the north.

2612. Perhaps you could see the Port Manager and ask him to send in a statement* on that point?—Yes, I can do so.

2613. Now, perhaps the Harbour Engineer would state anything further he may have to say regarding the proposed development schemes?—(**Mr. Holford Walker.**) Yes. The scheme under consideration at the present moment is one by Mr. Nicholson of Cape Town, and it is a modification of several other schemes that have been put forward. One of these schemes was first put forward by Messrs. Coode, Son, and Matthews. That meant constructing a breakwater, which would also be usable as wharfage, and a north breakwater, and a considerable amount of reclamation work inside, with solid masonry jetty. The whole proposal would involve a considerable amount of dredging. That scheme was estimated to cost rather more than 3,000,000*l.* Later on a scheme was put forward by a Mr. Methven of Natal. He suggested the construction of tidal docks at Zwaartkops River, about 6 miles from here, and that scheme and the one I have before mentioned were submitted to a commission of engineers in London, and they gave preference to Coode, Son, and Matthews's scheme, which they recommended. Later on, Mr. Methven had another opportunity of reporting, and he suggested an alternative scheme, which was a south breakwater pure and simple, with tidal docks at the north end of the town, which would have to be excavated on practically dry land. Mr. Nicholson reported on the matter later, and submitted his scheme, which is a south breakwater pure and simple, which shelters the bay from the south-east.

2614. That is a prolongation of the Dom Pedro jetty, I understand?—Practically, at an angle. And that, I believe, is estimated to cost about one and a half millions. The question of the provision of docks is in abeyance, but this breakwater will provide a sheltered anchorage, and give probably about 130 acres or so of water from six to six and a half fathoms, and perhaps 230 acres from five to six fathoms. That is the scheme under consideration at present, a prolongation of the Dom Pedro jetty forming a breakwater pure and simple.

2615. Suppose the scheme is carried through, what is the precise measure of benefit which you expect to derive as compared with present conditions?—Well, under present conditions, we are working in an open roadstead, exposed to the sea, and we have a highly-developed system of lighterage here which is carried on very well, but this lighterage will probably be done much cheaper.

2616. You save the cost of lighterage?—Not the whole cost.

2617. At present you handle 710,000 tons?—(**Mr. Clift.**) Yes.

2618. At 1*s.* 6*d.* that represents about 50,000*l.* a year?—Yes, and we would save a lot of double handling and wear and tear of cargo.

2619. Against that you have to set interest on the capital cost of your new harbour?—Yes.

2620. Which would be, say, five per cent. on one and a half millions, say, 75,000*l.* a year?—Yes.

2621. I assume that money is worth that in the Union, although you pay the Government less for it. At first sight that does not look like a good financial bargain?—We shall have more than two-thirds of the tonnage coming into the present

* The witness subsequently furnished the following statement:—

Tonnage of Cargo landed at Algoa Bay.

Year.	Sent in Transit.	Other.	Total.
1909 - -	115,325	199,675	315,000
1910 - -	174,453	265,815	440,268
1911 - -	184,467	301,721	486,188
1912 - -	233,536	297,423	530,959
1913 - -	260,359	314,908	575,267

jetties, and the cargo will be landed direct from ship so as to save all that double handling.

2622. The damage to cargo is, of course, difficult to estimate. The actual cost of lightering would appear to be now about 50,000*l.* a year?—That is about it. About 4,000*l.* a month. That is the wages of the crews, plus wear and tear.

2623. **(Mr. Sinclair.)** Have the harbour improvements been carried out with moneys advanced by the Government or is there a Harbour Trust?—I believe the money has been advanced by the Government. They advanced a certain sum, but I believe that a good deal of the money has come out of revenue. There is no Harbour Trust. **(Mr. Holford Walker.)** The control of the port was vested in the Harbour Board, and that was practically a Government trust.

2624. Is there any fixed return looked for on moneys advanced by the Government?—Yes, we pay interest on 1,477,000*l.* I do not know what the rate of interest is, but I think it works out at about 5 per cent.*

2625. Are the harbour dues fixed on a basis of producing the interest that you have to pay on the Government advances?—Yes, they have been adjusted several times owing to the profit that was being made or the money that was being lost. There is a big charge levied for depreciation, but the working of the port almost pays its way.

2626. Will further expenditure necessarily involve higher port dues?—There are no harbour dues here beyond the actual landing and shipping.

2627. The point in my mind is this: Further expenditure will involve payment by the trust of interest on the further amount advanced. Will the charges that will have to be made in order to provide that additional interest involve increased port charges?—No, I do not think so. The Government has been trying to establish uniform charges. I should explain that the harbours are now part of the Railway Administration, The Harbour Boards were abolished by Act of Parliament at the end of 1908.

2628. **(Mr. Lorimer.)** I see from the report of the Chamber of Commerce for 1913 that the tonnage handled here was 710,730 tons. How much of that paid lighterage?—575,261 tons were landed; 3,985 tons of ballast and 4,753 tons of bunker coal. In the above total 556,305 tons were landed and shipped in the roadstead. All that paid lighterage.

2629. So that you are saving by the new scheme in that respect about 40,000*l.*?—Yes, on the lighterage alone.

2630. You would want to expend a sum that would involve something like 60,000*l.* of interest. I am thinking of the 1½ millions at 4 per cent.?—Yes.

2631. And two-thirds of that you would get by the saving in lighterage?—Yes, alone.

2632. Is there any saving in addition to that in double handling?—Yes, and in wear and tear of cargo.

2633. Can you say whether there is any loss of traffic at this port on account of the absence of such facilities as you now desire to have?—I think we lose the bunkering of vessels. We handle the cargo so quickly that I think vessels favour us as a port. We have no port charges and the lighterage is the only cost.

2634. You have no port dues?—No.

2635. And the additional cargo you get would pay for those also?—Yes.

2636-7. The fact remains that your scheme would cost 60,000*l.* a year, and you can only make that up by additional traffic?—Yes.

2638. **(Mr. Bowring.)** What rise and fall of tide have you here?—**(Mr Clift.)** 4 to 6 feet mean; 5 feet at springs and 2 feet 6 inches at neaps.

2639. In regard to bunkering, I understand you could do a good deal if you had better facilities. Where would the coal come from?—Natal or the Transvaal. Geographically we are nearer to Australia than Durban is. A ship would save 300 miles by calling here instead of at Durban. There is the cost of steaming and the loss of time.

2640. Are you nearer the Transvaal coalfields than Cape Town?—Yes, by about 300 miles. I could not say with certainty.

2641. **(Sir Alfred Bateman.)** I suppose you would have more jetty accommodation for that 1½ millions?—I do not think so. I think that would be only the cost of the breakwater, but it would give us the use of the present jetty accommodation for a certain number of ships.

2642. You could make more use of it?—Yes.

2643. Do you think you could get more trade by it?—Yes, I think so.

2644. The financial part of your scheme, I understand, you are not interested in. If the Government adopts the scheme it is responsible?—Yes, under the new uniform tariff.

2645. If you can persuade them to do this thing they are responsible?—Yes, for the interest.

2646. I notice that your coal landed here has come down to practically nothing. It was only 6,000 tons last year?—Yes, because our coal now comes from the Transvaal by rail instead of by sea.

2647. And there was also 76,000 tons of railway material last year. Is that only temporary?—Yes, it is temporary until the railway system is completed; that is, they are relaying the lines with 80-lb. rails in place of the 60-lb. at present in use.

2648. Would it improve the prosperity of the town if you had better facilities for landing people?—Yes, more people would land and spend money in the town.

2649. Is the subsoil of the harbour favourable for these works?—Yes. **(Mr. Holford Walker.)** Most of the area is covered with a thickness of sand varying from nothing to perhaps 8 or 10 feet, and then you have a stratum of indurated sand or limestone, and beneath that you have a softer bed, and that varies in degrees of hardness until you get down to the rock, but it would all be amenable to dredging.

2650. On the whole it is a favourable condition?—I think so.

2651. And you are anxious to get all this carried out so as to keep Port Elizabeth abreast of the other ports?—**(Mr. Clift.)** There is another reason. There is no harbour between Cape Town and Durban, a distance of 800 miles, you might say, to which a vessel could run for absolute safety in distress. This place is absolutely midway between Cape Town and Durban.

2652. Do you think you could do much bunkering?—I think we could if the vessels could do it in smooth water.

2653. **(Mr. Campbell.)** Did I understand you to say that if you had a harbour such as you desire you would get further trade?—I think the trade would increase if the port was closed in.

2654. Do you anticipate getting it from other ports?—I think it would principally be the bunkering.

2655. In place of Durban?—Yes.

2656. Do the boats trading from Cape Town discriminate as to freights between any of the ports?—I have nothing to do with the freight question.

2657. They do not discriminate against Port Elizabeth?—No, I do not think there is any discrimination as regards freight.

2658. Do you know of any ports against which they do discriminate?—No.

2659. Is there any risk in entering or leaving the port? I suppose the insurance companies do not make any extra charge?—I do not think there is any extra charge.

* *Note by Witness.*—Port Elizabeth Harbour pays a fixed rate of 3½ per cent. on its debt of 1,477,000*l.*

On the proposed breakwater there would probably be a depreciation charge of 1 per cent. on the estimated cost of 1,500,000*l.*, making a total of 4½ per cent.

East London, Monday, 16th March 1914.

Mr. H. A. Lerchen, Partner in the firm of H. Knorr and Company, Steamship Agents, &c., East London, called and examined.

2660. **(Chairman.)** I think you are a partner in the firm of Knorr and Company, steamship agents, and a director of the East London Coal Company?—Yes.

The following statement was submitted by the witness :—

Coal Bunkering at East London.

I am a partner of the firm H. Knorr and Company, steamship agents and commission merchants, and also a director of the East London Coaling Company.

It is only the last year or two that East London has come into prominence through supplying ocean-going steamers with bunkering coals. It, of course, stands to reason that owing to being so close to Durban, which is only 240 miles from East London, the bunkering of vessels is only done under certain circumstances, which may be summed up as follows:—

(1) Steamers which discharge cargo at East London on their way to Australia, not calling at Durban.
(2) Steamers making East London their last port of call, returning from here to Europe.
(3) Steamers on their way to Durban getting short of coal supplies.
(4) Any steamers calling at East London as their nearest port to replenish their coal supplies.

For years past Cape Town have been increasing their turnover in bunkering coal, and at the present time fairly large numbers of vessels call there for bunkering purposes. The Government also assisted Cape Town materially by agreeing to do the work of bunkering, including trimming in the ship's hold, at 2*s.* per long ton, and it was only about a year ago that the same facility was also accorded to East London. There are various firms who compete in the bunkering business in East London.

The coal used is principally Natal, but Transvaal coal also comes down.

Owing to specially low rates of carriage a fair quantity of Transvaal and Natal coal now comes to the port here overland. The rate from Witbank, which is almost 1,000 miles from East London, is 14*s.* 4*d.* per ton, while from the Natal mines the rate is 14*s.* 1*d.* Off this the Government allows a rebate of 1*s.* per ton if the coal is used for bunkering. Thus coal can be brought here overland at a distance of close on 1,000 miles at a cheaper price than by sea from Durban, which is only a distance of 240 miles.

The bunkering at East London is done partly from two sides, viz., coal hulks, which are the property of my firm, are placed on one side of the steamer, while coal is also discharged from trucks on the other side from the shore; other coal contractors who do not own hulks do the bunkering from the shore side only. The capacity is about 700 tons per day. The contract prices are about 26*s.* per long ton bunkered and trimmed into the ship.

The coal brought here during 1912 over sea was 19,000 tons, and for 1913 14,000 tons; the lesser amount for 1913 is accounted for by a large quantity of coal being brought overland. In 1912 500 tons for bunkers were supplied, and in 1913 375 tons. While these figures are small they nevertheless show that bunkering can be done here as well as in Cape Town. There are always fair quantities of coal kept in stock, and this can be supplied at short notice.

During last year my Company bunkered several of the Union-Castle large intermediate steamers with very satisfactory results.

It is to be hoped that when the harbour improvements and the outer works are finished, and when steamers of practically any draught can enter our harbour, that then the bunkering will assume considerably larger proportions than at present.

2661. Do you see a possibility of developing the bunkering business here outside of coastal vessels? Do you think you can compete with Natal and Cape Town?—Not with Natal, because we use Natal coal, but I think we ought to have some of the business as far as Cape Town is concerned. This may be the last port of call for a vessel on the way to Australia, and other vessels may find themselves short of coal on arrival here. We ought to be in a position to supply those boats.

2662. Do you contemplate the possibility of Australian liners calling here instead of at Cape Town?—In regard to the very big ones which call at Cape Town at present there would be some difficulty in bunkering them here because they are too big to enter the river. But there are various steamers that call here with cargo and then leave for Australia, such as the German Australian Line, and other boats which finish their charter here, like the Clan boats, which go from here to Calcutta and often require bunkering. A lot of those vessels bunker at present at Cape Town.

2663. They bunker at Cape Town because the harbour facilities are better?—No, but Cape Town has been in the bunkering business longer than we have. About a year ago we started to bunker and we have bunkered various steamers here with satisfactory results and at a price no higher than Cape Town.

2664. What do you say about the railway rate from Witbank down to East London, are you satisfied with that?—It is certainly very low and I do not think it pays the Government, but that is another matter.

2665. Your coal from Natal costs you the same to bring from Natal, which is a shorter distance than from the Transvaal by rail?—Yes.

2666. What is the cost of bringing coal from Durban here?—About 7*s.* a long ton from Durban to East London, and the carriage from the mine to Durban is also about 6*s.* or 7*s.*

2667. So it practically comes to the same level, 14*s.*?—Yes, but it is always recognised that carriage by water ought to be cheaper than rail. You have a distance of about 1,000 miles by land, which is practically competing at the same rate for about one-third of the distance by sea, which does not seem to be a healthy state of affairs.

2668. That may be so, but there is the fact that you have your railway rate exceptionally low?—Yes.

2669. What do you say regarding the respective merits of Transvaal and Natal coal for bunkering purposes?—It is generally considered that the better class of Natal coal is superior to the Transvaal.

2670. To what extent?—I should say about 10 per cent.

2671. How does Natal coal compare to Welsh?—Opinions are very different, because practically every mine states that its coal is the best, and they have any amount of analyses to prove it, but I should think that the best Natal coal is below Welsh from 10 to 15 per cent.

2672. And Transvaal is about 10 per cent. below Natal?—Yes, it varies, of course. Some mines are better than others.

2673. **(Sir Rider Haggard.)** In regard to this bunkering, do you carry it out in the river or in the roadstead?—In the river.

2674. Then it is only ships that can get in the river that can bunker?—Yes. They could bunker outside, but it would be rather difficult owing to the lighterage.

2675. It is outside the question?—No, it is not absolutely impossible. In a case of absolute necessity it could be done.

2676. But practically?—Yes.

2677. Only ships that could come in could bunker?—Yes.

2678. That would not be very big ones?—We are bringing ships in to-day that draw 23·6 and 24 feet.

2679. Is it easy to get ships to come in drawing that amount of water?—No, when we do we have to watch the tide and the conditions have to be favourable. They would not be brought in if there were any risks. They could only be brought in if conditions were favourable.

2680. **(Mr. Campbell.)** Is there any discrimination in rates of freight on vessels calling at Cape Town and trading in this direction in regard to this port? I mean, does East London get a proportionally higher freight rate than Durban?—Of course, the freight rates vary On the whole East London pays more than Cape Town and on a good many lines we pay the same as Durban.

2681. Why is that?—The rates are arranged on the amount of traffic going northwards. Railway rates and freights and various expenses are taken into consideration to control the amount of traffic going into the competitive area.

2682. The ship freight is arranged with regard to the railway?—Yes.

2683. Do the sea freights fall in with it?—The railway rates have been fixed more or less on the present freights.

2684. The railway rates are fixed in accordance with the shipping freights, is that so?—No, I would not say that, but the freights are taken into consideration. If the shipping freights were all going down it would mean a reorganisation of the railway rates.

2685. You say that East London pays a higher rate on certain classes of goods than Durban?—Yes, and on some classes it pays the same.

2686. You are speaking of boats from Cape Town coming here?—I am speaking of ordinary cargo.

2687. Why does East London pay those rates?—It is a complicated question. The lighterage question must be taken into consideration here. In former times no ship could come in the river here and the lighterage was included in the freight because it was paid by the steamer, and now, although most ships come into the river, lighterage is still included in the freight.

2688. There is still discrimination exercised, although the necessity has passed?—I would not say the absolute necessity, because some of the steamers still have to lighter. The majority come in.

2689. Do any boats visit this port that cannot get into the harbour?—Yes, the mail boats, for instance, could not come in.

2690. Has there been any discontent about that discrimination in regard to freight rates?—We always consider our freights are too high.

2691. Have you made representations on the matter?—Yes, constantly.

2692. But you have had no satisfaction?—We do sometimes and sometimes we do not.

2693. Does the railway rate compensate you at all on those classes of goods for the discrimination which the ships make?—In some instances they do, but not in all.

2694. Do they in the majority of classes of cargo?—The ship's rate is always charged by measurement or by weight, whichever is the higher, whereas railway charges are always based on weight.

2695. **(Mr. Bowring.)** Do all the steamship lines trading from Europe make East London a port of call?—Most of them. Many go straight to Natal, however, and some go from Cape Town to Australia. But the great majority call here. In the former times there was a conference of the shipping companies and the rebates kept them all together. Now that the rebates have been done away with any ship could call here with cargo if it likes.

2696. Have you a coastal service apart from the larger steamers which come out from England?—No, except a few small steamers with timber from Knysna and the colliers. It is mostly the regular steamers which go from port to port that do the coastal service.

Mr. J. W. Sowarsby, M.Inst.C.E., Divisional Superintendent, and Captain M. G. Grogan, Port Captain, East London Harbour, called and examined.

2697. **(Chairman.)** Mr. Sowarsby, I believe you are Divisional Superintendent at East London?—Yes. That includes superintendence of the engineering, traffic, and locomotive working of the eastern division of railways, and also of the harbour.

2698. And you are in charge of the new works at the harbour?—Yes.

2699. Will you please tell the Commission the present condition of the harbour, and what proposals are under consideration at present for improving it?—Yes, I have the plan here. (*Witness produced the plan* and explained the same.*) The requirement at the present moment, as far as the harbour is concerned, is a better entrance. The trade of East London has somewhat outgrown the port. I would not say there is danger in bringing ships in, but the time has arrived when something better should be provided in the way of outside shelter. A vote of 150,000*l.* has been sanctioned by the Government for extending the south breakwater by 500 feet. 162 feet of the breakwater extension has been completed at an approximate cost of 75,000*l.*, but we have many yards of material ready for depositing as soon as the weather is favourable. A proposal has just been put before the Government for the further extension of the south breakwater by 500 feet, making a total of 1,000 feet, but that has not yet been sanctioned. In connection with the south breakwater extension, it was proposed that a new eastern arm should be constructed, approximately 2,000 feet long, coming off from the beach in the vicinity of the Marine Park, which is quite close to the Beach Hotel, and running practically at right angles to the present south breakwater, leaving an entrance of approximately 700 feet in width. The present east pier gives but little space between the west wall and the east pier. The intention is that the present east pier should be entirely removed, and that would necessitate also the removal of the sunken dredger that we had the misfortune to lose several years ago. There would be no difficulty in removing this eastern pier as soon as we have the necessary shelter of the proposed south and east breakwaters. In addition to the work I have already enumerated, there is a patch of rock about 22 feet 9 inches below low water, just off the present south breakwater head. Sanction has already been obtained and 10,000*l.* voted by Parliament for the removal of the rock. There is only about 4,000 yards to remove in order to take the depth down to 30 feet. I do not think we should be able to do anything in regard to the removal of that until we get the breakwater extended 500 feet, when the necessary shelter would be afforded and that rock would be taken out by divers after having been broken up by the Lobnitz cutter.

2700. What is your present draught of water?—We are practically limited to 22 feet. For long ships we state that we have 20 feet at low water.

2701. That would be the deepest vessel you could get in?—That would allow vessels of 18 or 19 feet to be brought in at low water. At high water we could take vessels in, under favourable circumstances, up to 23 feet and 24 feet.

* Not reproduced.

2702. What depth of water do you aim at?—I am under the impression we should not be satisfied with less than from 35 feet to 40 feet.

2703. And that depth you would get under the new scheme? Or would the expenditure for the deepening be in excess of that amount?—The deepening proper would be in excess of that amount.

2704. Could you do that out of current expenditure? —Yes, it could be done that way. We think if sanction is given for this amount we should start and persevere with the bucket dredger and have the deepening inside completed by the time the outer work is completed.

2705. In how many years would this be completed? —Given favourable conditions, and judging from the little piece we have done here, I think six years should go a long way towards finishing it.

2706. At what expenditure?—150,000*l.* is already sanctioned, and a further 150,000*l.* is required for the 1,000 feet extension, approximately. For the eastern pier 170,000*l.*, and the removal of the present eastern pier 60,000*l.*

2707. A total of 530,000*l.*?—Yes, in round figures. I can give you the exact estimate, if necessary.*

2708. Yes, I think that would be desirable. You might let us have it. Now, with your experience, do you think that with an expenditure of 530,000*l.*, plus the expenditure in six years in deepening the channel, you would have a harbour available for vessels drawing 35 to 40 feet?—Yes, at high water.

2709. And what maximum length? — Well, we could take the present mail boats. But the turning of the boats after we got inside would be the difficulty. Provision would have to be made up stream, probably at the first creek, for turning the vessels. We should require something like 800 feet or 900 feet across there. At present the width from the east to the west bank is only 700 feet.

2710. And you would require what expenditure to get an adequate turning basin?—That would be rather an expensive item. I should say it would run into 50,000*l.*

2711. That would enable you to turn a vessel of what length?—The present mail boats—500 feet to 550 feet. Of course, the question of turning in this area of 60 acres at the mouth of the river is worthy of consideration. Under certain conditions the boats would have to come in here at a pretty good pace so far as steering is concerned, but once having been brought into the river, if we were stuck for turning I think it would be worth while asking the port captain's views as to whether this area could not be utilised. It would be preferable to have a turning berth up stream, I should think. **(Captain Grogan.)** I think that vessels proceeding up river should be turned in the river as they could not be turned in the outer basin and towed stern up the river. It would be possible, if the east breakwater were completed, to turn long ships like the mail boats after passing the breakwater; and provision could be made in the future to berth vessels at the East breakwater.

2712. What is the actual depth of water *there*? —**(Mr. Sowarsby.)** There is plenty of depth, but the area is limited.

2713. What is the depth of the soundings shown on your chart?—This chart is somewhat out of date. *This* is a later one and it gives you the depths in 1905. It shows good water right through the narrows. In the channel there is no rock shown right away through to *this* point. (*Indicating on plan.*) *This* rock would not interfere in any way with vessels entering.

2714. Assuming you dredged out a new basin to allow of vessels turning, would not that get filled up with sand?—You would no doubt get a little, but there is no difficulty in dredging it.

2715. What is your present and contemplated dredging capacity?—We have one dredger of 2,000 tons capacity, another of 1,000 tons, and a third which is too small for the port, one of 600 tons.

2716. Do you contemplate adding to that capacity? —Yes, it has been recommended that a dredger of 3,000 tons capacity should be ordered.

2717. What would the cost of that be? Have you any idea? —The largest dredger we have now cost 72,000*l.*, so it would cost anything, say, from 80,000*l.* to 90,000*l.* to provide the dredger we want.

2718. Where do you employ your dredgers mainly? —The port captain is endeavouring, as far as possible, to work at the back of the breakwater. Our sand travels in that direction down the coast and, when we get very bad weather, we get it also round the eastern wall. But the dredging is being done here as far as possible to intercept the sand before it gets round the breakwater head.

2719. You set sand traps?—Yes.

2720. How long have you adopted that system?—It has been worked very efficiently for the last two or three years.

2721. Does it give thoroughly good results?— **(Captain Grogan.)** Yes, very good results. We are guided principally by the weather conditions as to where we dredge.

2722. Do you dig holes or merely scrape the sand away?—We merely make a big hole, where the sand goes down 40 to 45 feet. You can only make holes—you cannot scrape. That hole stops the sand drifting past into the channel. As soon as the catchpit area gets filled in—20, 18, or 15 feet—it drifts into the channel and silts up.

2723. **(Mr. Campbell.)** There is a good deal of rock between the east pier and directly opposite the south breakwater?—**(Mr. Sowarsby.)** Yes.

2724. Supposing you were to deepen the entrance to 35 feet, would you not have to take up this reef too?—(*Witness explained in detail by means of the chart that by taking away the East pier the entrance channel would be moved to the Eastward and the present rock under the lee of the South breakwater would be out of the fairway.*)

2725. **(Mr. Sinclair.)** Do the requirements of your port, within a time which is in sight, call for the extensive alterations of which you speak?—Yes, I think so.

2726. You consider that the time has arrived when the trade requirements of your port call for these improvements and this expenditure?—Yes, undoubtedly the port should be improved without further delay.

2727. Has the scheme been considered—as you have explained it to us to-day—by those in authority? —Messrs. Coode, Son, and Matthews have reported on several occasions, and Mr. Methven of Durban, the marine engineer, has also reported, and this scheme that I have described to you is practically the outcome of the reports of Messrs. Coode, Son, and Matthews and Mr. Methven, with the assistance of the local officers.

2728. Are the extension and the operations of which you have spoken a live scheme that you are going to try and carry out?—Yes, a recommendation was made a little while ago in Cape Town by the Harbour Advisory Board. They saw the Railway Board Commissioners and the General Manager of Railways and Harbours and the scheme was then fully discussed.

* The witness subsequently furnished the following statement:

EAST LONDON HARBOUR.

Estimate of Cost of completing Outer Entrance Works.

	£	£
500 feet extension of South Breakwater now in progress		150,000
Removal of submerged rock at entrance		10,000
Total vote sanctioned		160,000
500 feet further Extension of South Breakwater	150,000	
Construction of new East Breakwater	170,000	
Removal of East Pier and wreck "Lucy"	60,000	
TOTAL COST of Works awaiting sanction		380,000
		£540,000

Estimated cost of total scheme is 540,000*l.*, of which an amount of 160,000*l.* is already voted.

2729. Then it is regarded as practical polities?—Yes.

2730. **(Mr. Bowring.)** The harbour, as you have it now, is dredged from the Buffalo River mouth?—Yes.

2731. Is there any considerable amount of water running in the river—fresh water?—No, except in flood time.

2732. This is all a made harbour?—Yes.

2733. There was no basin there at all at first?—No.

2734. You have laid out a good deal of money on it already, I presume?—Yes. I think the capital is 2,000,000*l.* in round figures. But that includes our plant and very considerable shed, wharfage, and sidings accommodation, and other assets. The capital expenditure on which interest is payable is about 1,600,000*l.*

2735. **(Sir Rider Haggard.)** You said that a vote of 150,000*l.* had already been sanctioned by the Government?—Yes.

2736. What does that mean?—It means that the Government has given authority to expend the sum of 150,000*l.*

2737. How is that money raised?—By Parliamentary vote.

2738. The Government finds the money?—Yes: it is the General Railway and Harbours Vote.

2739. Do you have to repay the Government at all?—They charge interest and depreciation and there is a sinking fund.

2740. Then to carry out these other works you have spoken about you would have to get another vote of roughly, say, 300,000*l.* or 400,000*l.*?—Yes.

2741. Would that money be obtained in the same way?—Yes.

2742. And therefore it would depend on whether you could convince the Government that those works are necessary, whether or not you would get your money?—Attention has been drawn to the fact that if these works were carried out the lighterage at the port would to a great extent disappear and, consequently, an approximate cost of 16,000*l.* to 18,000*l.*, which is the present cost of lighterage per annum, would be saved under this head. It is anticipated that the larger boats would come in and additional revenue be gained from this source.

2743. Of course, if your lighterage disappears it means that a certain amount of employment disappears also?—Yes.

2744. Therefore, a certain amount of money disappears in connection with this lightering business, does it not?—Yes, approximately 2,000*l.* per annum is spent in lighterage crews. But all these people would not be turned adrift. **(Captain Grogan.)** More ships would come into the port, and, therefore, these men would be employed there.

2745. You look to the increase in trade to make good any loss which might be entailed by getting rid of the lighters?—**(Mr. Sowarsby.)** Yes, but there will be no loss by abandoning lighterage, in which connection see statement handed in.*

* The following is the statement :—

Statement showing effect of providing inside Harbour Accommodation to all Shipping dealt with at East London during the year 1913.

	£	£
Saving of lighterage expenses, including working, upkeep, and maintenance of lighters, proportion of towage and cranage involved, and interest and depreciation on the plant used		16,549
Estimated additional revenue from shipping thus brought into harbour (on present tariff), 206 vessels, including 104 mail-boats :—		
Harbour dues, pilotage, and towage	14,934	
Cranage, water, fenders, &c.	950	
Saving in claims due to less and better handling of cargo	150	
		16,034
		32,583

Note.—Under the tariff proposed to be brought into effect from 1st July next the additional revenue as above is estimated to amount to 12,342*l.* instead of 16,034*l.*, making a total of 28,891*l.* instead of 32,583*l.*

2746. You would have to convince the Government of the desirability of this in order to get the large sum of money you require?—Yes, we would have to convince the powers that be that the time has come when we should have a better entrance to the port.

2747. Have you a good prospect of convincing them of that desirability?—I would suggest that the representatives of the Harbour Advisory Board, who met the Railway Board a fortnight ago, placed the case very clearly before them. It is very difficult, indeed, to judge whether the powers that be were convinced or not, but, at the same time, I think they realise the necessity for something to be done.

2748. Supposing you failed to convince them—is there any other method by which you could get your money?—No, I do not think so.

2749. You have to pay for a new dredger, roughly 100,000*l.*?—Yes.

2750. And in addition to that you have to pay for your deepening?—Yes.

2751. So the bill is going to be pretty considerable?—Yes.

2752. What do you anticipate in return supposing this is all done and you have a harbour of 60 acres? What do you anticipate your increase in trade will be?—In the first place, we get more efficiency of working and better conditions for the handling of cargo. It is difficult to predict the actual increase in trade, but so far as this port is concerned the trade is increasing.

2753. You lie between two great ports—Cape Town and Durban?—Yes.

2754. And do you think, supposing all this expenditure is made and you get all these additional facilities, that you will be able in future to get enough of the general trade of South Africa away from Cape Town and Durban to repay the outlay?—Yes, I think the distance between Cape Town and Durban warrants another port here, and I think the back country we have is sufficient to keep that port going.

2755. You think you will have a fairly large port and that you will get enough business from your hinterland to keep any number of vessels which use that port laden?—I would answer that in this way—I feel confident that our trade is going to increase.

2756. You will admit that this is an economic question—whether it will pay?—Yes, and I think, apart from that, if you take the engineering side of the question, it is time something was done to improve the entrance.

2757. This is the question—when you have spent your half million will you get a sufficient increase of trade to pay for it?—We shall maintain our trade, and my own opinion is that we shall get a sufficient increase of trade to pay for it.

2758. And you think that trade will produce enough money to recompense the Government for the expenditure?—Yes.

2759. That will mean a good many more ships?—Yes.

2760. And when you have these ships in you will have to turn them up to the creek to turn them, and that will involve a further expenditure of 50,000*l.*?—Yes, approximately.

2761. And even then you can only turn a ship of the size of the present mail boat?—It is impossible to give the actual figures because this scheme has not been estimated thoroughly in so far as dredging the creek is concerned.

2762. But that is your idea?—Yes. I think that is the proper place.

2763. And what depth of water would there be—35 to 40 feet?—Yes.

2764. That would mean that although you could accommodate the largest ocean-going vessels you could not turn them?—Provision must be made.

2765. But these big vessels of the near future will be 700 feet to 1,000 feet long?—**(Captain Grogan.)** We are not anticipating those. But you could make it available for those even: you could make this creek as wide as you like.

2766. That would add to the cost?—Yes.

Bloemfontein, 20 March 1914.] Mr. W. EHRLICH, J.P. [*Railways, Harbours, and Coal for Bunkering and Shipment.*

2767. What has been spent already on this harbour? **(Mr. Sowarsby.)** The assets total two millions, including dredgers, lighters, tugs, wharves, and all the accommodation. The capital expenditure, including all plant, breakwaters, wharves, appliances, sidings, &c., is between 1,600,000*l.* and 1,700,000*l.*

2768. What does the town have to repay to the Government annually? I presume it pays interest?—Not the town. The Government does the whole thing.

2769. **(Mr. Campbell.)** Does the revenue from the harbour meet the sinking fund with interest now?—I am afraid it does not, owing to the tariff in force, which was not designed to meet the full interest and depreciation charges.

2770. By how much?—We lose 54,000*l.* odd per annum. But I may mention that the question of tariffs is receiving the consideration of the Government, and if uniform rates are brought into operation, as proposed, from the 1st July next, there will be no difficulty in making the harbour pay.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. W. EHRLICH, J.P., Vice-President of the Bloemfontein Chamber of Commerce, called and examined.

(*For evidence of this witness on "General Trade Questions," see p. 158 of* [*Cd. 7707*].)

2771. **(Mr. Lorimer.)** You or some other representative of the Chamber said that the harbours should be made self-supporting. That would be desirable, of course, but you say, I understand, that this would lower railway rates to the inland towns. You expect that the railway rates should be reduced to the extent that the harbours are made more profitable?—Yes, at present the harbours are worked at an annual loss of about a quarter of a million, and that actual loss has to be made good out of the profits of the railways, and this profit is paid for by the up-country individual.

2772. But I do not quite follow you when you seem to think that that would cheapen your imports, because the additional harbour charges in the way of dues would be imposed on the articles imported, would they not?—Yes. We do not say that it would make any difference in the cost, but the burden would be better distributed.

NATAL.

Durban, Monday, 23rd March 1914.

Mr. J. T. WILLIAMS, Managing Director of The Natal Navigation Collieries and Estate Company, Ltd., called and examined.

(*For evidence of this witness on "Mining," see p. 24 of* [*Cd. 7707*].)

2773. **(Chairman.)** You are engaged in the coal industry?—Yes, I have been connected with it for fourteen years, since 1900.

2774. You have been good enough to supply memoranda on the Natal coal industry?—Yes.*

2775. You give the annual output totals which show that the output amounted to 2,608,000 tons in 1913?—Yes, there is a detailed statement showing the annual output for each year.

2776. And you state that the collieries could increase their output by 50 per cent., provided there was a regular supply of rolling stock and adequate native labour?—Yes.

2777. Is that with their actual plant?—Yes, with the collieries as they stand to-day.

2778. You would not require further machinery and equipment?—No, I do not think so, not very much, provided we have sufficient native labour and no difficulties as to truck supply.

2779. And could they sell that extra amount at present prices?—No.

2780. Then are you tied up by the absence of a regular supply of rolling stock?—Yes, the supply is always more or less intermittent, although the amount of railway stock is always increasing. They do not seem to be able to overtake the expansion of trade and ordinary maintenance or wastage.

2781. Has there been some complaint as to trucks being kept waiting a long time?—That is, of course, the stereotyped reply of the railway administration; they point out that the trucks are under load at the ports, but the storage trucks at the ports are an absolute necessity unless they supply an equivalent storage in some other form such as bin accommodation. At the Bluff there is a bin to-day capable of holding 10,000 tons, and the quantity of appliances necessary to handle the coal in the usual way is not sufficient to deal also with the bin. They can only put coal into the bin when the appliances are otherwise idle.

2782. You mean to say that the trade stores its coal at Durban in trucks in preference to taking it out. Do you actually store your coal in trucks at Durban?—Yes, to a large extent.

2783. Is that not rather an extravagant way of using trucks?—Yes, it is, but there is no other way of doing it, and owing to the irregular manner in which the ships arrive here, you cannot off-load the trucks as they arrive at the ports, because we are entirely in the hands of the ships; they arrive irregularly, and the trucks are off-loaded irregularly

2784. It comes to this, that you use the trucks as a store?—Yes.

2785. In default of the existence of other means of storage?—Yes.

* *See* Appendix III., p. 148.

2786. What would be the cost of providing the means of storage?—I cannot say, but the Government have already arranged for increasing the loading appliances, which will make the bin more useful than it is at present.

2787. What is the average number of trucks standing here?—It varies, but I should say about 8,000 to 16,000 tons in long tons, and more at times.

2788. And the total amount of coal put into steamers annually here is what—I mean for cargo or bunker?—For bunkers, taking 1913 as a basis, the tonnage put into vessels was 1,081,205 tons, the tonnage put into steamers as cargo for export was 615,550 tons. In percentages you will see it stated on page 1 of this abstract. The averages have been calculated for the outputs of four years, but the details of each are shown in Annexure "A."* Bunkers take 49 per cent. of the total output, exports 19 per cent., railways and harbours 14 per cent., and the balance, 18 per cent., was used in South Africa itself for inland consumption.

2789. Are those proportions remaining constant?—No, they vary.

2790. Give us the general tendency?—In bunkers it varied from 1,080,000 to 1,266,000 tons, and in regard to exports in three years from 323,344 tons to 615,550 tons. The other factors are the quantities used by the South African Railways and by inland consumers. They vary according to the trade and commerce of the country. I would add in this connection that if you take the 1913 figures as a basis, it will be found that the average tonnage bunkered per day, taking a year to consist of 310 working days, comes to 3,500 tons. Taking the exports for 1913 as a basis the tonnage exported per day was roughly 2,000 tons. The total shipment of coal for 1913 represented 5,500 long tons per day for bunkers and export.

2791. With cheaper labour or more labour and reduced railway rates, there is a very large potential market in South America?—Yes.

2792. Dealing with the question of railway rates, are you satisfied with your present railway rates?—We are not at all satisfied either with the rates for bunker coal or for export coal. We cannot enter the South American market with the present export rate although it is 1*s.* 1½*d.* per long ton below the rate for bunker coal.

2793. Can you give the rates for the two?—For bunker coal per long ton the general rate is 6*s.* 8*d.* for an average distance, that is, for the distance mostly traversed, and the rate for export coal is 5*s.* 6½*d.* per long ton. As a matter of fact we have not been able to send any coal to South America to any extent. One company did try that market four or five years ago, but I do not think it was a payable experiment.

2794. Your lowest rate for export coal is what?—5*s.* 6½*d.* for export and 6*s.* 8*d.* for bunker. When I say it is the lowest rate, I mean it is the lowest rate for the bulk of the traffic. There are one or two collieries where the rates are slightly lower, and in one case 5*s.* 10*d.* and another 6*s.* 1*d.* for shipment coal, I think.

2795. That for a haul of how many miles?—The average haul is about 248 miles, but in regard to the most important collieries the haul is 241 miles.

2796. That comes to about ½*d.* per mile?—It is one-third of a penny as a matter of fact, except for long distances, that is, distances in excess of 240 miles. For distances over 240 miles the rate is ·297 of a penny per ton per mile unless the general rate of one-third of a penny comes to more. It is rather complicated, but it means that there is a uniform rate of 6*s.* 8*d.* for certain distances, and after that it is ·297 for some distance, and then it becomes lower.

2797. The rate comes to between ½*d.* and one-third of a penny per mile?—Yes.

2798. The lowest rate is ·297 of a penny, and you consider that too high?—Yes, for coal shipped at Durban.

2799. Taking into consideration the difficulty of haulage over the hilly line?—Well, we think the rate of 6*s.* 8*d.* is very profitable to the railway department notwithstanding all the difficulties.

2800. Is it because the line is a difficult one to work?—Yes, but it becomes easier as more expenditure is applied to it in removing and enlarging the curves and reducing the gradients.

2800*a*. Is considerable improvement being made in that direction?—Yes, very considerable. In fact, at the present time the gross load is 620 to 640 tons. On some sections of the line not so very long ago, the gross load would be below 400 tons. There has been a decided improvement, due partly to improving the gradients, but also to the introduction of higher-powered locomotives. The Mallet engine has considerably increased the load carried.

2801. And when all the improvements now in process of execution are complete, will there be much further improvement?—When all the improvements now in progress are completed it will probably suffice for the 50 per cent. increase in trade which we refer to, but whether it will provide for the expansion which Natal is looking forward to in a few years hence, I cannot say; I doubt it.

2802. Have you anything to say about the alternative line?—We think that the construction of a line similar to the one we call the alternative main line is necessary. We want a shorter route. We want to reduce the distance, to quicken the speed, and reduce the cost of working the railway so as to enable cheaper coal rates to be established.

2803. In regard to oversea markets, to what country or countries do you anticipate increasing your trade?—We ought to be able to increase our trade to India, the Straits Settlements, &c., the Dutch East Indies, Mauritius, the East Coast of Africa, and South America. The largest of those markets is South America, if we could get in. That is the country which imports the most coal to-day. I think the imports from the United Kingdom to-day represent something like three or four million tons per annum.

2804. Have you detailed figures regarding the cost of coal in those countries?—I can supply those later on.*

2805. Now in regard to trade with India. What is the current rate of freight from India to here on cargo coal at the present time?—We pay 6*s.* 6*d.* to Bombay at the present time. Freights have been 8*s.* I have given examples of what has been paid in the past in the statement of what rates have been obtainable for coal from Natal in the different years mentioned.

2806. The total of those places consume what or how much coal per year—an enormous lot?—Yes. Bombay alone will take from 300,000 to 500,000 tons from South Africa. It imports oversea 1¼ to 1½ million tons. The other markets it is very difficult to estimate, that is the Straits Settlements and the East, but they ought to take something like 100,000 to 150,000 tons. You will notice from my statement that we come into competition at all these places with

* *See* p. 152.

* The witness subsequently furnished the following statement (dated March 31, 1914):—

"I have just obtained by cable quotations for different "coals at destinations which Natal looks upon as actual and "possible markets. The figures are as follows:—

Coal supplied.	Bombay.	Colombo.	Singapore.	River Plate.
	s. d.	*s. d.*	*s. d.*	*s. d.*
Welsh	30 3	30 6	31 3	32 9
Indian	19 0	18 0	19 0	—
Australian	22 0	22 0	22 0	—
Japan	20 6	21 0	19 0	—
American	—	—	—	27 0
Natal	21 3	21 0	22 3	—

"No doubt contracts would be based on prices above or "below the foregoing figures, say at variation of 5 or 7½ per "cent."

other coals, especially in India and the Straits Settlements. In India we come into competition with Indian coal itself, with Transvaal coal, Welsh coal, Japanese coal, and also Australian coal. The same coals also compete at the Straits Settlements and the Dutch East Indies.

2807. I suppose the cheap freight from here to India or the extreme East ports depends very largely on the import trade here, ships coming here in cargo and wanting something to go on with?—Yes, to some extent, but I think it also largely depends on steamers coming across for cargoes in the East calling at Durban and sometimes taking cargo away.

2808. Coming from where?—Sometimes from South America and sometimes from the United Kingdom, but when they come from the United Kingdom they have usually a cargo for Durban. When they come from South America they often come in ballast to pick up a cargo here.

2809. Is a large proportion of the coal exported to India taken in ships that come in ballast from South America?—Not a very large proportion. That is mostly done by the boats of the Clan Line, the Bullard King Line, the Hall Line, and the Bucknall Line.

2810. Well, they are from the United Kingdom?—Yes.

2811. Bringing goods here and wanting something to go to India with?—Yes.

2812. And have you an increasing trade between East and West, especially with Australia. What is your bunkering business with ships returning from Australia, is it increasing?—Yes, very rapidly.

2813. And have you figures for that?—No.

2814. Could you give us figures?—Yes, we will supply figures in regard to coal supplied to steamers in the Australian trade.*

2815. That is an increasing trade, I understand?—Yes, a rapidly increasing trade. All the important steamship owners engaged in the Australian trade during the last four years have largely increased the number and size of their vessels; the "Ulysses" is a case in point. She called here the other day to take over 3,000 tons of bunker coal. She belongs to the Blue Funnel Line, and that coal was put on board in less than a day, although she was not coaling continuously.

2816. The Australian ships that bunker here are on the return voyage to England, or do you get some outward-bound vessels also?—It is rarely that we get an outward-bound ship here. In 1913 we had a number, but I understand it is not likely that there will be much business of that kind unless all the lines agree to call at Durban, owing to the time taken on the route *viâ* Durban being from two to three and a half days longer. Naturally, one or two lines do not want to prejudice themselves by calling here unless they all agree to do so.

2817. Calling at Durban on the outward voyage means an increase of distance of 1,000 miles?—Yes, but I think you have to take more than the distance into account. From Cape Town to Australia you have the advantage of the prevailing westerly winds, which do not help so much from Durban, but in the reverse direction it suits them to call at Durban so as to avoid the head winds, which help them in the other direction. I understand that before the Australian steamers began calling at Durban, their course was fixed only about 200 miles south, so it did not mean much extra time coming *viâ* Durban and coaling there. In the reverse direction, of course, they would be considerably south, in fact south of the latitude of Cape Town.

2818. Now, what do you say regarding your port facilities here. You have already said the bin facilities or the handling into the bin are not sufficient?—Yes.

2819. Is it not the case that Natal coal deteriorates by frequent handling?—Any coal will, and some Natal coals are more brittle than others.

2820. Is Natal coal exceptionally brittle or not?—No, not generally speaking, but some of it is rather brittle; I would not say any of it is exceptionally brittle, that is, as brittle as South Wales coal, for instance. I have seen South Wales coal at Cape Town very much smaller in size than Natal coal when it gets to Cape Town; that is no doubt due to handling.

2821. What is the quality of Natal coal as compared with Welsh?—I should say the best Natal coal would be about 10 per cent. inferior to Welsh coal, but, of course, there are coals and coals in Natal, some of them would be considered much less efficient than Welsh coal. We have had tests made on the Cape Railways where Natal coal gave better results than Welsh, although the best Welsh coal was used, but perhaps that was due to want of proper knowledge of handling of the two coals.

2822. What is the freight from Durban to Cape Town?—The freight from Durban varies. It has been as low as 5*s*. 3*d*. We paid the Union-Castle Company 5*s*. 3*d*. in 1910, and 6*s*. in 1911 and 1912, and 8*s*. in 1913, but at present, I believe, the freight would be about 6*s*. 6*d*. to 7*s*.

2823. Has there been any combination of Natal coal owners to secure cheap freight from here to Cape Town?—There is a combination of Natal coal owners, one of the objects of which is to make an export trade possible, that is to facilitate the shipment of large quantities at one time.

2824. From here to Cape Town?—Yes, and elsewhere.

2825. Was that combination not able to obtain means for reducing the freight?—We believe the freights we paid were about as reasonable as any we could get from anybody else.

2826. What rate did you pay?—The freights we paid were those stated. Until last year the freighting of the coal from the Associated Collieries has been done by the Union-Castle Company and this year the Company has gone out, and the same coal companies have entered into a contract with a private firm—a certain number of them.

2827. At what rate?—We have sold the coal at prices free at ship Durban, and the buyer makes his own price at the other end. That was the case with the Union-Castle Company, and when I say we paid these figures I do not mean that we quoted c.i.f. Cape Town, but we know those were the prices the Union-Castle Company included in the freight in arriving at their prices in Cape Town. We paid these freights on coal outside the contract. We sold at those prices to the Union-Castle Company, leaving them to provide shipping and so on.

2828. I suppose you would consider that if the Australian mail, instead of going through the Suez Canal, came *viâ* the Cape and returned *viâ* the Cape, it would be of great benefit to you?—Yes, we would thereby increase very much the export of Natal coal to Cape Town for bunkering purposes. But it would, of course, suit very much better to divert it to Durban. It would suit the town better and facilitate the bunkering of the coal.

2829. That would be difficult in the case of the mail steamer, would it not?—It might be.

2830. **(Mr. Sinclair.)** You said there was no storage at the port for coal. Are there no bins at the mines?—Yes, most of them have bins, and these have been made necessary by the insufficient supply of rolling stock.

2831. There is storage in bins for considerable quantities at the mines, is there not?—Yes, I think

* The witness subsequently forwarded the following statement:—

Approximate tonnage of coal supplied at Durban, for bunkers, between July 1st, 1912, and March 21st, 1914, to steamers in the Australian trade:—

	Tons.
1. Tons supplied to passenger steamers (regular liners)	161,000
2. Tons supplied to cargo steamers (regular liners)	138,000
3. Tons supplied to cargo boats (tramps)	83,000
	382,000

the largest quantity that can be stored at any individual mine is 1,500 tons, but those bins were not provided for storage accommodation as such, but in order that the mine might be kept working when trucks failed.

2832. Does the Admiralty take any coal?—Yes, they take coal for the gunboats and for transports between India and the United Kingdom.

2833. Do they make it a condition of the contract that there shall be storage accommodation for certain quantities?—No, there is no such condition.

2834. Are you charged for using the trucks belonging to the railway department for storage of coal in the ports?—No, there is no demurrage charge. If a demurrage charge were made we could not afford to pay it.

2835. You are very favourably situated as against some other countries that are coal producers in the matter of labour costs, are you not?—Yes, and we give the buyer a corresponding advantage in the price of coal. I suppose the price of coal at Durban is cheaper than at any other place in the world.

2836. **(Mr. Lorimer.)** Can you tell me what is the rate per ton per mile for Transvaal coal to Cape Town and Natal coal to Cape Town?—The principal coal-sending station in the Transvaal is Witbank. The rate per ton per mile from there to Cape Town is ·15 of a penny for bunkering and ·16 of a penny for coal used at Cape Town itself. From the chief coal-sending station in Natal to Durban the rate for bunkering is ·33 of a penny per long ton, and I think it works out at ·27 of a penny per ton for export coal; the figures from Witbank are for short tons. For short tons the figures: Hatting Spruit to Durban, would be ·25*d.* and ·246*d.* respectively.

2837. Practically the one rate is double the other?—No, not quite double, but very nearly.

2838. Now, of your Natal trade can you say how much goes to Cape Town for bunkering, I mean in percentages, and how much comes here for general export and how much comes here for bunkering?—Taking 1913 as a basis, the *total* bunker coal was 1,080,205 tons, and the quantity exported by sea as cargo 615,556 tons.

2839. Does the export overland include what you send to Cape Town for bunkering purposes?—No, it is stated as exports by sea. The figures for export to Cape Town are given on another page. Last year they were something like 300,000 tons.

2840. Can you tell me how many trips a wagon will make in a week backwards and forwards to the colliery?—Yes.

2841. If you were free from all accidents and disturbances on the railway, and delays, how many times would a wagon go to the coalfields in the course of a week?—About twice.

2842. How many trips does it actually make now?—I think about three trips in a month.

2843. Whose fault is that?—It is partly the fault of the railway and partly due to the want of storage accommodation at the port, because you cannot discharge the trucks as fast as they arrive.

2844. You use the wagons as stores?—Yes.

2845. Do you pay anything for that?—No.

2846. Does the Government make any claim for demurrage?—No.

2847. Is it not asking rather a good deal to ask them to provide storage accommodation for you?—Well, they have provided it to the extent of 10,000 tons at the port, but that is of very little use, because they have not sufficient appliances to put the coal into the bin.

2848. Supposing you had these bins, would they add much to the cost of handling?—They make a charge of 2*d.* a ton per week for storage in bins.

2849. Is that in addition to loading and unloading again?—They make no charge for loading into the bin, but they charge for reloading into the steamer the same charge as they would make for loading into ship *ex* truck.

2850. Well, if you cannot put it into the bin on account of the risk of fire, can you keep it in the truck any longer?—It is kept in the truck from 1 to 10 days, perhaps, according to the colliery whose coal it is and according to the arrival of the steamer.

2851. It would be a partial solution of your difficulty if the bin accommodation was increased?—Yes, and the present bin accommodation made effective.

2852. You cannot expect the Government to supply an indefinite number of wagons and keep them as storage?—No, not an indefinite number, but we have always maintained that we must have storage accommodation in one form or another, in trucks or bins, for 25,000 tons.

2853. I see by your paper you think you would get some of your difficulties removed if you had more powerful locomotives?—Yes.

2854. I do not know whether you are aware of it or not, but there are no locomotives in the world in respect to power like those of Natal for the 3 feet 6 inch gauge?—When I say more powerful locomotives, what I mean is a larger number of the powerful engines which they have got; they should have more of the Mallet type.

2855. I do not think you have much room to blame the Government; they are doing very excellent work for you; and there is another thing that you have to bear in mind, and that is that there is a limit to that which they can economically do, because if they were to make heavier locomotives, carrying more weight on the axle than now, they would have to reconstruct that section of their railway line on which these engines run?—I do not recommend that they should increase the tractive power per engine, but I suggest that a larger number of high-powered engines should be obtained for this traffic.

2856. What are the functions of the railway board as it now exists?—I cannot tell you.

2857. Have they any statutory power to deal with such conditions?—The railway board do not know themselves what their powers are, and they are going to ask Parliament to pass an Act defining these powers.

2858. A new line to the coal-fields has been proposed for many years, has it not?—Yes, during the last fourteen years.

2859. No doubt that would facilitate the traffic immensely, but the reduction in the gradients is a great step in advance, and do you think that the traffic would justify an additional line to the one which already exists?—I hope the traffic will justify the additional line, because, I suppose, before many years are over, the question of either duplicating the present main line or constructing a new line will have to be seriously considered, at any rate we hope so.

2860. I think you said that the coal was carried in wagons holding 35 to 40 tons. Is that coal for shipping purposes?—Yes.

2861. How are those coal wagons unloaded, are they discharged by hopper?—No, by dumper discharge, that is side discharge.

2862. That is slow work?—Except so far as the Bluff is concerned, where they have appliances for discharging the coal. By one operation the wagon is tilted over and discharged by one movement.

2863. Are those 40-ton wagons lifted bodily and slung over the ship?—No, but they are lifted bodily in order to be discharged. A truck carrying 35 tons is lifted bodily and tilted in order that the contents may be put into six wagons of six tons each. These six tons units are then lifted one by one by the Temperley transporter and taken from the dumper right across to the ship.

2864. How long does this operation take?—I think they can put two 6-ton trucks into a ship in about three minutes.

2865. **(Sir Alfred Bateman.)** The output of your coal is now four times what it was ten years ago?—Yes.

2866. That is a very large increase in spite of all these hindrances?—Yes, but the railway has been

improved wonderfully during the last two years, and this bin is a matter of recent history, and the dumper and other loading appliances have not been installed many years ; but we want to go forward, we are looking to the future.

2867. Do you attach importance to the combination among coal companies in Natal?—I attach importance to any movement which helps us to get an increased price for our coal.

2868. Do you consider they use their powers in moderation?—Yes. In great moderation, I think, when you see that even to-day the price of coal is only 17*s.* for the very best, and if a large contractor takes a large quantity he gets it at 16*s.*, free alongside at Durban.

2869. Do you sell coal for inland consumption?—We sell a small quantity for inland consumption at a low price at the pit's mouth.

2870. The price at the pit's mouth is not a very good guide?—Only in this way ; it shows the relative position of selling prices in the different Colonies, compared one with another. All the statistics at home are arrived at in the same way. The Board of Trade returns, for instance, only give you the averages. If you compare those tables with those issued by the Board of Trade you will find that South African prices are the lowest in the world practically. In fact, our figures are given in the Board of Trade returns published in England.

2871. Has your combination ever chartered its own vessels to take its coal to Cape Town?—Not this present combination ; it has been done by the previous combination.

2872. When was that?—During the war and shortly after. But that was only done for coal sold to the railway. We have never chartered a steamer for coal for the general public, including shipping. In those days the Natal collieries used to secure a large proportion of the coal used by the railways, and that was a big tonnage. We knew exactly how much was wanted every month, and arranged accordingly. But when we are dealing with the public requirements we cannot work out our estimate so exact.

2873. I suppose, if you were put to it, you could do it?—Yes, and we may have to do it. It depends on the conditions prevailing. If we found that stress of circumstances required a lower price at Cape Town the first step would be to consider the problem of freight.

2874. But what you cannot influence is the railage rate from the colliery to Durban?—Quite so, and we cannot influence the prices which the Government have fixed as the railway competitive rate. At home the public have the remedy in their own hands.

2875. I notice in the Railway Tariff there is a step at 240 miles—a difference in the rate. Was that for the purpose of fixing your rate or is it a natural break?—It was the adoption by the Union Administration of a scale that was in operation in Natal itself before Union. The reason why the scale broke at 240 miles was for the purpose of encouraging long-distance traffic in competition with the collieries nearer to the port, but when they adopted that scale as part of the Union scale, it seems to me the Government should have adopted the principle that it should be uniform right throughout the scale, and not pick and choose. But they reduced the scale for short distances so as to benefit the Transvaal, and reduced it very considerably for the longer distance again to benefit the Transvaal. We have no long distances over which that scale would be of much use.

2876. **(Mr. Campbell.)** You speak of the policy of attracting settlers to the land and the extension of industries ; is that a policy of encouraging immigration?—Yes. I merely put it in to show that the want of population is at the bottom of all our difficulties.

2877. Have you any suggestion as to the line of policy?—No, I simply speak from the point of view of one who wants to increase consumption.

2878. **(Mr. Tatlow.)** Did I understand you to say that, owing to the want of bins, you required to have 25,000 tons of coal stocked in wagons at the port?—We ask for that as the possible maximum. We can do with less.

2879. Your requirement would represent over 1,000 wagons kept under load?—Yes.

2880. But, as a matter of fact, what number of wagons have you, as a rule, held up with coal at the port—anything approaching that amount?—It varies from 9,000 to 30,000 tons. It was 27,000 the other day, but that was exceptional.

2881. It is very extravagant to do business in that way?—It varies every day. Sometimes we have unloaded the trucks as fast as they arrive. It depends on the arrival of the steamers. There have been days when there is hardly a steamer in port.

2882. Has the Government undertaken to provide bins?—They have not undertaken to provide additional bins, but they are putting up additional machinery which will make more effective the bins we have.

2883. Surely it would be far more economical to provide bins than to store in wagons, and they would also get a revenue of 2*d.* per ton per week from bins?—Yes. On the other hand, every extra handling breaks the coal.

2884. But is that the concern of the Government?—No, except that the Government must take the broader view that whatever helps the coal industry of the Province helps the Government, and if the coal is made so small by extra handling that ships do not like it, not only shall we suffer, but also the Government and everybody concerned.

2885. That is not given as a reason why they do not provide bins?—No.

2886. In regard to the rate—you say the reduced rate is an important matter in the expansion of your business. You do not go so far as to say that it is seriously retarding your business?—It does usually retard the export trade—the rate of 5*s.* 6½*d.*

2887. But if the Government demonstrated to you that they could not carry it at a less rate with a fair profit, what would you say then?—If they were able to demonstrate it to us we might be satisfied, but as I put it in one of my notes, the great bulk of the money received from coal is spent in the Colony. There is only a few pence returned to shareholders ; therefore all the money received for coal is spent locally, and I think it does not matter to the Government so much whether they get that money in the form of railage or in some other form for the support of the population.

2888. But then I thought the railways were conducted as a business proposition?—I am sorry we do not agree that it is so in every case.

2889. With a rate of less than one-third of a penny a mile it does seem to me, who knows something about railway haulage, as a very moderate rate?—Yes.

2890. Are the gradients against or in favour of the load from your collieries to-day?—It is a zigzag line—up and down.

2891. Is the balance in favour of the load or against it?—I should think it would be against it on the whole. In fact, one of the notorious difficulties of the line is the gradient. On the line, Estcourt to Highlands section, they are working on a grade of one in thirty, for many miles against the load. But these difficulties are being removed gradually, and I am taking that into account. I understand that before long the ruling gradient will be one in fifty or one in sixty-five. When that comes about, the working of the traffic will be much more economical.

2892. But you will have a heavy gradient even when it is reduced to one in sixty?—But when that comes about it will be better than it was before.

2893. **(Chairman.)** What would be the ruling gradient by the proposed alternative line?—One in sixty-five.

2894. Is that a surmise?—It has been surveyed as one in fifty.

2895. And you say it can be reduced to one in sixty-five?—Yes, that is claimed by one surveyor.

2896. By technical authority?—Yes.

2897. With regard to the bunkering trade in Cape Town, what proportion of the bunkering trade comes

to you and what proportion goes to the Transvaal?—Until this year all the bunkering was done with Natal coal, but with a small proportion of English coal re-shipped. Even now English coal is imported into Cape Town, but it has been a reducing tonnage since the Natal coal has become prominent for bunkering in Cape Town. I think now it is only at the rate of about 28,000 tons a year. I do not think we can stop very much more of that because it is taken to finish the loading of the steamer, and is mostly brought in by the Clan line of boats from Scotland.

2898. What about the competition with the Transvaal in the bunkering business?—We come into competition with them this year for the first time in Cape Town because of the lower rate which the Administration put into force last year. That is the rate of ·14*d.* per ton per mile that we complain of.

2899. **(Mr. Tatlow.)** I suppose the rate from the Transvaal comes out to practically the same as yours to Cape Town—so much per ton. How does it work out—the comparison per ton against your coal? What is the figure per ton at Cape Town?—The railway rate from Witbank to Cape Town for shipment coal is 13*s.* Ours for export coal to Durban is 4*s.* 11*d.*, that leaves 8*s.* 1*d.* to cover all other charges—that is, shipping, freight, and putting off the side of the ship at Cape Town. There is a margin to-day of 8*s.* 1*d.* as against the Transvaal rate in truck alongside water, Durban, before shipment as compared with price of Transvaal alongside wharf, Cape Town.

2900. **(Sir Alfred Bateman.)** I suppose it was meant to put you on an equality?—I think the object was to compel Natal to reduce the price of coal to Cape Town, and once that price is reduced Transvaal coal will stop coming down.

2901. **(Mr. Lorimer.)** Have you shipped any coal to South America?—Only one consignment, which was a loss.

2902. You had no repeat order?—We did not want one under those circumstances.

2903. What have you to compete with there?—South Wales coal and other coals from the United Kingdom.

2904. And the price you say—how much less than Welsh coal, do you remember?—Yes, it was less, if I remember rightly. At that time we were having to quote 23*s.* 6*d.* c.i.f. to secure the trade at all. I do not know what the comparison would be to-day. But the coal was sold here at 7*s.* 4*d.* at the pit's mouth. It was sold at 14*s.* f.a.s. Durban. The South American business was done at an absolute loss.

2905. And was the price you obtained the best you could get?—Yes.

2906. Because you say here you are very anxious to get into South America, but if you cannot do it except at a loss it does seem rather hopeless?—Yes, that is why we are trying to get the Railway Administration here to reduce the rate of freight on export coal.

Mr. Otto Siedle, Chairman of the Natal Coal Owners' Society, called and examined.

2907. **(Chairman.)** You are Chairman of the Natal Coal Owners' Society?—Yes.

2908. You have heard the evidence of the last witness, and I think you wish to add something in regard to the extension of trade to South America?—Yes. The actual evidence has been given by Mr. Williams, but unfortunately, owing to my absence in Cape Town, I have not had an opportunity of a conversation with him or seen his report in full, but I may say that I was interested in the cargo that went to South America, and to which reference has been made, which resulted in a loss. We are in the difficult position of being in competition with large coal owners, who are also largely interested in the railways of South America, and that is responsible for our not being able to enter the South American market, in addition to the fact that freights are not obtainable. At the period when the shipment was sent to which reference has been made, there was a trade in meat with South America, and steamers were coming here from the Argentine with frozen meat supplies, and that made it possible to get reasonable freights back to South America. But at present there is no class of trade which makes that possible. The steamers that come down from India going in that direction come laden with cargo, and they are very few and far between. On the other hand, the steamers taking coal from Cardiff to the Argentine, which would come round this way for the purpose of getting bunkers and going on to the East and Far East for freight would not afford the necessary cheap freight we require. We could not possibly do anything with the Argentine at anything more than, say, 7*s.* or 8*s.* a ton in the way of freight, owing to the United Kingdom supplying very large quantities, as I have mentioned. I was asked by Mr. Hoy, the General Manager of Railways, to say what I knew about the matter. I do not see any possibility of developing that trade with South America unless we get over the difficulty of the very many vested interests we have to compete with, and those vested interests had a great deal to do with the loss we had before, because we were frozen out.

2909. Those vested interests are in the mines and railways jointly, and I suppose in the mines and shipping companies also?—Yes.

2910. Then the question really comes down to cheap freight, and cheap freight means the question of return freight?—Yes.

2911. And there is no possibility or probability of much freight from South America here?—No. On the other hand, we hope to do business shortly—the business they were doing with us—exporting frozen meat and dairy produce to the United Kingdom, instead of receiving anything from South America.

2912. Well, that will not give the coal steamers a return freight?—No, certainly not.

2913. Do you see any other kind of freight that you could get in return?—No.

2914. Then, as regards India, what are your views there?—We are doing a large business with India now, and we find that there also we are up against a very difficult proposition. The prices have gone down to a great extent. As is well known to you, the freight market of the world has gone down to a great extent on account of indifferent business, and unless we can produce our coal cheaper, our chance of extension in the Indian market is not very great, although we have been doing very well.

2915. But have not the lower freights now prevalent given you cheaper freight from here to India?—Yes, but not commensurate with the lower price that we are expected to accept in India under existing conditions. We were able to get better prices last year and the year before than we are able to get this year. The Ceylon market we are doing business with. We supply the railways there, but as Mr. Williams's report will tell you, we are only getting half the business we got a year or two ago. The Cape Town market has been attenuated on account of the fact that large contracts have been made for Transvaal coal owing to the reduced railway rate. It seems to me that Singapore and the other Far East ports that we have done business with are not giving us the same amount of encouragement that they did. A reduction in the railway carriage would not bring about the needed result. I do not see that we can expect a very great reduction off the rate we have now.

2916. So your principal hope is that the coal against which you compete will get dearer while yours will get cheaper freights?—Yes.

2917. What do you say in regard to the development of trade with the Australian steamers?—Well, that is developing. I heard Mr. Williams's evidence, and I must go very much on the same lines. The larger-sized steamers coming from Australia are increasing the demand for bunkering purposes, and

they find that they are able to do very well by entering this port, and therefore it is necessary that this port should not be behind others in its deep graving dock that we are very anxious to get here, and which I understand Cape Town is also anxious to get. But in regard to our trade, we are getting increasingly large steamers here. Our depth of water is now about 35 feet, and this can be increased. When I first came here we had about 6 feet. We must have a large graving dock to render it possible for us to find the necessary facilities for docking these very large steamers, which I expect will increase in size as time goes on, quite apart from the Imperial mail contract, which you are so anxious to see arranged right through from Australia to Europe. Therefore I hope that we shall have the necessary facilities in that direction. The Australian trade has been spasmodic owing to strikes in Australia, and sometimes steamers were taking supplies here sufficient to take them to Australia and back again here, and that gave an enormous fillip to our business three or four years ago. We shall no doubt increase our trade from Australia as the size of the steamers increases, and steamers coming from Australia will, I feel certain, continue to call at Durban, whatever facilities Cape Town may offer. The coal does not get broken up so much where it has not to be handled so frequently as it would have to be if bunkered at Cape Town. It means that the coal will have possibly nine handlings before it is bunkered in the steamer in Cape Town, when taken there from here by sea. I think that is about all I have to say in that respect.

2918. **(Sir Alfred Bateman.)** I understand you are chairman of the Coal Owners' Society?—Yes.

2919. Which is not the same as the Natal Associated Collieries?—No, but I happen to be chairman of both.

2920. There is a difference in the objects?—Yes. I founded the Coal Owners' Society five years ago to protect the interests of the industry as a whole, with regard to mining regulations and railway rates and things of that sort—quite apart from the commercial aspect of the industry.

2921. Is the Coal Owners' Association simply a combine?—The Natal Coal Owners' Association, or rather the Natal Associated Collieries, is the so-called mysterious combine that was referred to in the evidence in Cape Town.

2922. And the other is the Society that looks after the general interests of its members?—Yes.

2923. **(Mr. Campbell.)** What is the business of the Coal Owners' Association?—The Natal Associated Collieries?

2924. Yes.—The business is to try to improve the prices obtainable for coal generally, and to divide up the business among the members, and also to be able to supply the ships more quickly, and do away in some respects with this delay to railway trucks, because we can substitute coal—we have contracts with right of substitution. There are eight collieries in this combination, and if one coal is not available the other is offered for bunkering purposes.

2925. How many collieries are outside?—There are about eight producing collieries, some large and some small, outside.

2926. Has the effect of the Association been to raise the price of coal?—It has. Instead of cutting each others' throats by competition, we were able to offer a better grade of coal, to improve prices, and to afford better facilities than any single colliery, acting independently, could do by going into the market and trying to do bunkering business.

2927. In case one member of the society was unable to fulfil an order here at the port the other would take it on?—Yes. That is on the contract form—if one colliery is not able to carry out an order another coal is offered, so as to avoid delay.

2928. **(Mr. Tatlow.)** You said that one of the objects of your Society was to reduce railway rates; do you mean that you combine in order to get the best railway rates from the railway department, or that one colliery does not approach the railway department without the consent of the others?—No, it is a Government railway. When the Coal Owners' Society has any grievance, we combine to press that grievance home, but there is no fighting against one another. The rates are absolutely fixed by the Department.

2929. But I did not quite understand in what respect your Society worked in the matter of railway rates for the benefit of your members?—Here is an instance: they have made a special rate in favour of the Transvaal, and we join together for the purpose of getting what we consider to be our rights. Combined action as against individual action—that is what it amounts to; and also we endeavour to assist the Government in regard to information in connection with the coal industry. Our Society has become the centre from which the Government gets information which they require. Until the Society was brought into existence there was no organisation of coal owners, and Government got into the habit of consulting the Mine Managers' Association in matters of vital importance to the coal owners and often involving heavy expenditure for them. The formation of the Society has proved of benefit to the coal industry generally.

2930. **(Mr. Sinclair.)** Are questions relating to working in the mines generally fixed by the Society—wages, for instance?—We have not got that far yet. We find that we have to agree on that sort of thing. We have not had any strikes until recently. We agreed upon the rates that we would offer to settle the strike. We made uniform rates of wages for the miners.

2931. And your Society is able to discuss questions and differences that arise with your workers as one body now?—Yes, and we are also on the point of making our constitution stronger than it was before. It was not sufficiently comprehensive.

Durban, Tuesday, 24th March 1914.

Mr. H. Shadwell, Harbour Engineer, Captain J. C. Young, Port Captain, and Mr. B. H. Wisely, Chairman of the Durban Port Advisory Board, called and examined.

2932. **(Chairman.)** You are the engineer to the Durban port, Mr. Shadwell?—Yes.

2933. And you are in charge of all construction work?—Yes.

2934. Have you charge of the dredging?—No, that is under the charge of the Port Captain.

2935. You have been good enough to answer the usual questions here which we have asked in the case of all harbours in South Africa,* and we are indebted to you for your answers. Will you kindly explain the new scheme which you now have under consideration? *The following description is taken from a memorandum subsequently supplied by the witness:—*

The scheme now suggested is arranged on the bay principle giving berthage for one ship only. It allows for the increase in size of shipping, the proposal being to construct the jetty work in ferro-concrete, which also lends itself to deepening of the berth which, in the present instance, has been laid down at 40 feet below low-water mark.

The face line originally proposed by the experts on harbour matters has been nearly adhered to, such alterations being made as to admit of the working in of the graving dock. The proposal as it now stands is to have berthage for 14 vessels, 12 of which are 700 feet in length, and one long berth on the old quay wall plan of 1,800 feet, whilst a further berth in the vicinity of the graving dock will be available either for rough goods or timber, and when not engaged for a ship waiting its turn to go on the dry dock. It may be suggested that a berth 700 feet long is not sufficient

* *See* Appendix V., A., pp. 157–160.

for the rate of progress in shipping, but I would point out that with the introduction of ferro-concrete staging the extension of any of the berths is easily accomplished and, therefore, ferro-concrete lends itself to the deepening of a berth which can be effected without endangering the superstructure far better than in the case of a quay wall.

Dredging.—The amount of reclamation necessary is large as it will be essential that the area beyond that allowed for harbour purposes should be raised from sand-bank level to, at any rate, the level of the esplanade, and a considerable amount of dredging to give 40 feet of water will also be necessary, but it is not absolutely necessary that the fairway be dredged to the full depth now, although it is advisable to dredge out the maximum depth required at the jetties.

2935A. What is the total cost of this scheme?—Exclusive of the graving dock it is nearly 2,000,000*l.* The graving dock depends upon the depth of the sill; but I do not think it would be a higher figure than three-quarters of a million.

2936. That is assuming a length of 1,000 feet and a depth at low water of 35 feet?—Yes, and a breadth of 110 feet.

2937. And to carry that from 35 feet to 40 feet will cost about how much?—No increase of cost. It will be 35 feet at low water and 41 feet at high water.

2938. How long will it take to carry the graving dock scheme through?—I should say from five to seven years.

2939. And if the new harbour extension scheme was fully carried out, what accommodation would you have?—We should have accommodation under this scheme for 14 large-sized vessels.

2940. You mean with a length of 700 feet?—650 feet under present conditions, with a possibility of extension.

2941. And what would the draught be?—40 feet.

2942. With a shed alongside each vessel?—Yes.

2943. What landing appliances would be included?—Electric cranes.

2944. And if that scheme was carried through according to the estimates you have given, you would have a 40-feet draught. What would be the draught outside?—It would also be a 40-feet draught.

2945. That would be included in the estimates?—Yes, included in that sum.

2946. So you would have access over the bar and up the channel to these new quays with 40 feet of water?—No, the amount I have given you is 40 feet in the vicinity of this new work, and the way I propose to arrive at it is to dredge out each of these embayments to 40 feet right off, and then, as the shipping requires it, to dredge the remainder in the ordinary way, that is under maintenance, but the new work would be done under construction so that 40 feet outside would not be obtainable at the same time as this would be done unless the shipping warrants it.

2947. Is the 40 feet obtainable with your present dredging plant or is your present dredging plant fully occupied in keeping your present depth?—**(Captain Young.)** We have plenty of time for development with the present plant.

2948. Your present plant is adequate to keep your present level intact and to improve?—Yes.

2949. At what kind of rate would you improve?—We can get the 40-feet depth as quick as they build the wharves.

2950. Without any addition to your present dredging plant?—Yes, without any addition.

2951. Have you included the present channel in with the depth?—Might I mention that we have two dredgers capable of reclaiming and deepening, and these two dredgers are at present laid up. We could put them into commission at any time we require them. We have laid them up for economy.

2952. Taking your present channel, what depth of water do you get on the bar?—At present we get 36 feet at low-water springs.

2953. That would give you 42 feet at high-water springs?—Yes.

2954. Why is it that the White Star ships are not allowed to go out with a greater draught than 31 feet?—I think they have a very hard and fast rule as to safety.

2955. You consider then that it would be safe in favourable weather to take a ship out drawing 35 feet?—To-day the "Ceramic" should have gone out drawing 35 feet with perfect safety.

2956. With a margin under her keel of what?—Inside 2 feet and outside over the bar about 5 feet or 6 feet.

2957. What additional allowance should be made on the bar for a sea running?—I generally reckon for large ships from 3 feet to 4 feet.

2958. Is that in calm weather?—Even with the scend. Of course, with only 4 feet under her and with a heavy sea running at the bar there is a chance of bumping.

2959. You want 4 feet for the scend plus the ordinary allowance between the ship's bottom and the sand?—Yes.

2960. But you say to-day that a ship drawing 35 feet of water could with perfect safety have come in or gone out?—Yes.

2961. At high tide?—Yes, at high tide.

2962. I notice in your soundings that there is a spot shown where there is a bank and only 31 feet of water?—It is about 31 feet to-day.

2963. With what object was that left?—There was always an idea of having a bigger margin at the bar than inside because inside the ship is lying in smooth water.

2964. Then what is the lowest point at the bar?—36 feet low-water springs.

2965. Is there any difficulty in removing those two shallow spots?—No, there is no difficulty, we can remove them easily, but we have quite sufficient water for the ships.

2966. Is that quite so? Did not to-day rather show that it was not so?—Certainly, if larger ships are coming, as appears very likely, we will have to increase the depth, but at the present time we have not the wharfage to accommodate these large ships. There is only one deep-water berth, 38·6 feet.

2967. It comes to this, that the increase in the draught of ships has proceeded faster than you expected?—Yes.

2968. But that having occurred, it is quite easy for you to catch up?—Yes.

2969. I understand there is no technical or dredging difficulty in getting this channel down to 40 feet or even more, if necessary?—Yes, we could get it within a year.

2970. And really the same applies to a great deal of the water in the bay?—Yes.

2971. There is no rock, it is merely a matter of dredging capacity, I understand?—Yes, inside the bay it is all soft stuff easily removable.

2972. Are there any points you would like to bring before the Commission besides those?—**(Mr. Shadwell.)** No, except that I am strongly of opinion that it is most essential we should go on these lines. It is very necessary that we should have a graving dock here.

2973. In regard to that point, are you confident that you would have sufficient demand for graving dock accommodation?—**(Captain Young.)** At the present time we have 23 applications from boats that want to dock almost at once. The "Dover Castle" makes it 24, and she will block the way for the next month or six weeks.

2974. That looks as if you will have a great many customers when you get the dock?—Yes. There is, for instance, the vessel "Arphagus." If she could have docked she would have gone in to-day. The floating dock, of course, is not large enough to accommodate the large steamers that are now coming in.

2975. Her maximum capacity is 8,000 tons dead weight?—Yes, and as the dock grows older that capacity will be decreased.

2976. What length of vessel can she take?—About 470 feet. The steamers that are now being built for

the Eastern trade, both German and British companies, are larger than we can accommodate on the dock.

2977. I believe there was a large ship belonging to the Union-Castle Company which sustained slight damage at Delagoa Bay the other day?—Yes.

2978. Where could she have docked if the damage had been severe?—She could not have docked anywhere except at Simonstown; if permission of the Admiralty can be obtained, that is the nearest place.

2979. And northward where is the nearest port?—There is absolutely no dock on the east coast. Bombay would be the nearest place. A vessel like the "Ceramic" cannot be docked here in South Africa. Neither could the "Persic" or the "Medic" or the mail boats, except in the Simonstown dock with permission of the Admiralty.

2980. **(Sir Alfred Bateman.)** Do you think you will get increased revenue for this expenditure?—It is an increasing revenue from year to year.

2981. But what increased revenue could you get in consequence, first of this dry dock, and, secondly, of all this other expenditure?—I think we are bound to have increased revenue.

2982. But have you any sort of estimate? You seem to have made out a wonderfully strong case for the dock, but I am asking in regard to this expenditure of 2,000,000*l.*?—That is for increased wharfage and the dock will be nearly another million. We want to be an up-to-date port whether it pays or not.

2983. But it does not rest with you, I suppose, it goes to the central authority, the Government?—Yes.

2984. And will the upkeep from year to year be increased by this expenditure?—The cost of the floating dock will be increased, but not so much as you would think, because the crew from the graving dock can also work the floating dock in the same way as we work the floating dock from the slip to-day, because we are not docking ships every day. One crew can almost work the two. The upkeep of the floating dock will, of course, increase with age.

2985. In regard to the two docks being used fully, I suppose there is a bit of chance about it. You may have a great demand at one time but not at another?—Well, nearly all this year we have had a demand all the time. Many ships have gone away in disgust because they could not use the dock. Some have gone to India and some to Australia.

2986. **(Mr. Tatlow.)** Do you find at present that your deep-water berthage is insufficient for the requirements. Does delay occur to vessels in consequence?—Occasionally, it does, especially with certain vessels. Some of the captains object strongly to lying aground and others do not mind. It very often happens that a vessel will lie off and wait for a deep-water berth.

2987. And it is an existing need that more deep-water berthage should be provided?—Yes.

2988. Is that floating dock of yours sufficient to dock the "Dover Castle"?—Yes, it will just take her.

2989. Do larger vessels ever present themselves than the floating dock can accommodate?—Yes, there have been vessels here that would have gone in if we could have taken them.

2990. Have you numerous applications for accommodation in the floating dock?—Yes.

2991. And you have only one floating dock at present?—Yes.

2992. Does delay occur to these vessels waiting for accommodation?—Yes; there is one waiting at the present time, and she will have to wait until the "Dover Castle" comes off.

2993. How long will that be?—About a month or six weeks.

2994. **(Mr. Sinclair.)** The expenditure already incurred on harbour accommodation here has been given as a little over 4,000,000*l.*?—Yes.

2995. And you have further expenditure in contemplation amounting to 2,000,000*l.*, and another million for a graving dock, and it is estimated I see, from the figures that have been given to us, that it will take about 50,000*l.* to deepen the channel to about 40 ft. Now will you tell us in how short a period this large and liberal expenditure which you have already incurred has been made? What period have you taken to find the 4,000,000*l.* that have already been expended?—**(Mr. Shadwell.)** The whole of the 4,000,000*l.* covers the outer works as well as the inner harbour works, whereas this proposal for 2,000,000*l.* is confined to the inner harbour.

2996. I wanted to find out in how short a time you had made this very liberal provision for the requirements of your harbour—the 4,000,000*l.* that you have already expended?—That has been since the commencement of the harbour.

2997. In how many years? I want to get the record of the expenditure which you found yourself in a position to make over a period of years in the past which has not been mentioned?—I think about thirty-five years, but the bulk of the work has been done during the last fifteen years, especially the quay wall work. In the eighties we only had one shed, "B" shed, and since then the shedding and quay wall work has gone on, that is in the last twenty years.

2998. During the last twenty years your community has found the bulk of the 4,000,000*l.* that has been expended?—Yes.

2999. It is the measure of enterprise that I wanted to get on record?—Yes.

3000. As regards revenue for the future, are you satisfied that the additional expenditure which is proposed to be made would be justified by increased revenue which you may reasonably look for?—Well, it is rather a difficult question to answer. But it is very evident that we must have graving dock accommodation for the shipping which is bound to come here before very long, whether it provides more revenue or not. And the next point is, if the shipping increases, we should get a revenue commensurate with the outlay, which need not all be put in hand at once. I should point out that the construction work will be carried out in the ferro-concrete system, which admits of extension in any direction.

3001. Is the harbour paying its way now?—Since Union the harbour has been mixed up with the railways, and there was recently a Commission appointed to go into this question. The result of that Commission I am not prepared to lay before you to-day because I do not know.

3002. **(Sir Alfred Bateman.)** The revenue is given as 219,000*l.*, and the expenditure 321,000*l.*?—**(Mr. Wisely.)** We have just had a Commission appointed which has been going into the question of the Union Harbour tariffs and the charges made at the various harbours in South Africa with a view to making the harbours self-supporting, and a tariff of charges is being drawn up.

3003. **(Sir Jan Langerman.)** I should like to ask whether the cost of dredging and reclaiming is added to the 4,000,000*l.*?—**(Mr. Shadwell.)** It is included in that.

3004. In regard to the ground that you sell after reclaiming, how is that treated? Does it come off the 4,000,000*l.* or does it go to revenue?—We do not sell.

3005. What is the graving dock accommodation south of the line and eastward from Cape Town?—**(Captain Young.)** There is a small dock at Mauritius and a small one also at Madagascar.

3006. Cape Town has accommodation also, has it not?—Yes, but it is smaller even than our floating dock. It could not take the "Dover Castle." I am not sure of the size.

3007. If you built a good large-sized graving dock here you would have practically two docks south of the line?—Yes, if we built one with a length of 1,000 feet.

3008. And that would attract shipping here, you think?—Yes, I think so.

3009. What is the condition of your coal supply now? In August last you had dozens of vessels hung up, and some had to go away. What is the position now?—The position to-day is that we have plenty of coal and few vessels.

3010. How has that condition been brought about?—I think it is a reaction from the strike; at that time it was said there were no trucks.

3011. Have you had more trucks since?—Yes, more trucks are coming every day, being imported.

3012. How is it you allow coal to be stored in trucks when you can use them on the line?—We have not storage room enough, and we have not got the ships to put the coal in. Consequently, an accumulation of coal remains in the trucks.

3013. Is it not a bad principle to store coal in trucks?—It is admittedly a bad principle, but as the coal traffic of the world, so far as I know it, is stored in trucks at the port of shipment, it must also be admitted that unless the coal traffic in South Africa is given similar facilities it cannot be expected to compete.

3014. We find in Johannesburg that the mines run short of coal for want of trucks owing to the fact very largely that you have the trucks down here storing coal?—When there is an accumulation of coal down here they stop sending more coal, they stop supplying trucks to the mines. Day after day the railways ask the different mines what they require in the way of trucks for ships in the harbour and those that are expected, and they supply trucks accordingly.

3015. You had a strike in August. How did you manage then?—We managed pretty well through the strike, but towards the end we were short of coal and short of trucks, and then they started sending coal down towards the Cape more liberally than here. Some steamers cancelled their orders and brought coal from England.

3016. Would a duplication of the line keep a constant supply of coal here?—Yes, and also reduce the rates.

3017. Are they doubling the line?—Yes, a portion of it.

3018. Will that assist you in keeping a constant supply of coal here, because it is important that you should have a constant supply?—I do not think it would be so good as giving us another line. It would cheapen the rates, and if we had cheap rates and cheap coal we could bunker more steamers.

3019. You are well supplied to-day, and you do not see any immediate shortage?—Not just at present, but how long that will last I do not know. It is only perhaps a reaction from the late strike.

3020. You anticipate no difficulty?—I am afraid it will be the same again in a short time when the ships come in.

3021. But you do not anticipate another strike?—No, but we cannot get enough trucks. There was a steamer which left here yesterday with 1,000 tons of coal from England for Mauritius, and a few weeks ago there was another for Cotts and Company which came out with a cargo of coal. It was going to New Zealand, but when our strike broke out it called here for bunkers and brought the coal here.

3022. They ordered coal on account of the strike?—Yes, they bought it on the sea, but when the ship arrived the strike had finished, and they had no use for the coal. We took some of it here, and some of it went to the Cape.

3023. **(Mr. Bowring.)** What are your dry dock charges here?—5*d.* a ton for the first 1,000 tons, 5*d.* a ton for the second 1,000 tons, and 3*d.* a ton for the balance. That is for the first 24 hours. That is on the gross tonnage. Then 3*d.* a ton per day afterwards.

3024. How has your dry dock paid, so far?—I think it just about pays expenses now. It pays better than it did. For the first three years or so it did not pay.

3025. I suppose you have been developing your business year by year, and now you have more than you can do, even for the vessels of the size which it can take?—Yes.

3026. You have a great deal of business of the size which the dock can take, have you not, and which you cannot deal with?—Yes.

3027. You have made no estimate, have you, as to how your new dock, if you had it, would pay if you spent one million on it?—No, but in view of the large size of ships that are coming out here it is essential that we should be equipped with a dry dock capable of taking the largest ships, especially as there is no similar dock within 1,000 or 2,000 miles.

3028. I suppose you anticipate that eventually a big dock like this will pay?—Yes, in the long run, it will, because more and more ships will use it, and if the dock was fitted with a pontoon in the middle we could put smaller ships on at the same time.

3029. You mean if it was built in two divisions?—Yes.

3030. I take it that you justify your demand for this new expenditure, not only on the ground that it will pay, but that you have shown in the past enterprise, foresight, and courage in providing good harbour facilities, and you want to remain in the front of the battle?—Yes. In the past the ships have increased in size faster than we have increased the capacity of the port.

3031. And apart from the question of payability you take a great deal of pride in your harbour?—Yes, the whole of the expenditure would not come in one year, the work would go ahead gradually, but it is certainly necessary that we should have more deep-water berths at once, and a dry dock.

3032. **(Mr. Tatlow.)** In the contemplated additional expenditure, has anything been provided for the extension of the coal bins so as to avoid that disastrous delay with the railway coal wagons?—**(Mr. Shadwell.)** Not under the scheme submitted, but provision has been made and passed by the House of Assembly for an extension of the coal plant, and this plant is now being made.

3033. Is it not obvious that to keep coal in wagons is a very extravagant proceeding?—Yes, but it cannot be helped.

3034. But you say it is contemplated to provide additional bins?—No, not additional bins but additional plant. The coaling appliances will be practically doubled. That will mean quicker handling.

3035. Will that mean a lesser number of railway trucks under load?—Yes. **(Captain Young.)** It frequently occurs when we are busy we have 10 or 12 ships lying out at the buoy waiting for coal. If we had extra wharfage and the other appliances necessary we could have got rid of the ships and liberated the trucks.

3036. But does not the merchant have to pay 2*d.* a ton per week for storage of the coal in the bins?—**(Mr. Shadwell.)** Yes, but the great thing is to avoid breaking the coal so much. It is better to put it straight into the ship. The more handling it receives the smaller it becomes.

3037. You state that the interest on capital is 140,000*l.* a year, and the maintenance charges 160,000*l.*, or a total of 300,000*l.* Does that maintenance charge include all working charges as well as what is ordinarily understood by maintenance?—Yes.

3038. I mean wages and everything connected with the working of the harbour. What does that 160,000*l.* include, roughly? Does it mean working expenses as well as the maintenance of machinery, and so on?—Yes. The harbours as a whole show a loss of between 240,000*l.* and 250,000*l.* a year.

3039. **(Sir Alfred Bateman.)** This Commission, which you have referred to, may recommend an increase in rates to make it balance?—Yes, we are increasing the wharfage both outward and inward.

3040. Is there a margin for increase without keeping vessels away?—The wharfage is paid on the goods, not by the vessels.

Durban, Wednesday, 25th March 1914.

Mr. Alexander Harvey Rennie, Shipowner and Shipping Agent, called and examined.

(*For evidence of this witness on "Cable Communications," see page* 80.)

3041. **(Chairman.)** What is your business, Mr. Rennie?—I am a shipowner and shipping agent.

3042. I believe you have devoted particular attention to the question of a graving dock at Durban?—Yes.

3043. Are you connected at all with the ship repairing business?—No.

3044. We had an opportunity yesterday of visiting the harbour and of seeing the proposed location of the graving dock, and also of hearing from the harbour authorities particulars of the work proposed to be undertaken, and their arguments tending to show the urgency of the scheme. We shall be glad to hear what you have to add to that?—I have prepared this paper, which I will read if you wish.

The paper was as follows:—

Graving Dock, Durban.

Durban is most excellently situated as regards its geographical position for the site of a graving dock. It has first of all a magnificent natural harbour, capable of taking in ships of the deepest draught and largest dimensions at all states of the tide, and, in case of necessity, also by night. Perfect shelter is given by the entirely land-locked nature of the harbour. Suitable foundations have been found by boring experiments which have been conducted by the Union Government, and the proposed dimensions of the dock are as follows:—

1,030 feet in length, 110 feet broad at entrance, 41 feet deep on sill at high water spring tide or 35 feet at low water.

These dimensions will make it the largest graving dock in the world, with the exception of the Gladstone Dock at Liverpool.

Owing to this port's geographical position in the direct line for traffic from India, Burmah, China, Japan, Straits Settlements, Mauritius, and Madagascar, to America, North and South, and *vice versâ*, it is practically one of the most important ports on the ocean highway. There is no dry dock accommodation from Durban right up the east coast of Africa, and as Durban is the terminus of the mail service from the United Kingdom, and also of the East African lines of steamers run by the Union-Castle, British India, and German East Africa Companies, it is uniquely situated for supplying the wants of "all round Africa" shipping trade. It is also the first port of call for all steamers homeward bound from Australia *viâ* the Cape of Good Hope route.

Salisbury Island in the centre of the harbour belongs now to the British Admiralty and is bound sooner or later to become an important naval station, and the possession of an up-to-date graving dock, capable of taking the largest class of war or mercantile steamer afloat, or likely to be afloat for many years to come, will be of the utmost advantage to the Empire at large.

Durban is possessed of four or five large ship repairing and engineering works, run by private enterprise, in close proximity to the proposed site of the dock. These works are fitted with the latest and most up-to-date machinery, carrying large stocks of repairing material, and are capable of supplying all the requirements of ships requiring help and assistance.

The proximity of Durban to the Natal coalfields is also a unique advantage, and the Admiralty authorities can always rely on Durban as being a certain and efficient base of supply, protected by batteries and offering a fair haven in time of war. There is a practically unlimited supply of water.

Owing to the nature of the borings, it is expected that the graving dock of the dimensions mentioned will be built at a comparatively cheap figure, and if given out to private enterprise the Union Government will have no difficulty in getting the dock in being in a very short time. My firm have been Lloyd's agents here for the last 24 years, and underwriters have frequently expressed their appreciation of the work that has been accomplished with the present floating dock, and the other facilities of the port generally.

First-class harbours should have a depth of 45 feet, and I think this could be provided at Port Natal if required. As it is, the depth of water we have at present at Natal makes Durban a port very high up in the category of the world's ports.

The Thames will only have an effective depth of 30 feet at low water when the present dredging programme is completed; and Natal can take larger ships even now than can go into the Port of London.

Southampton has an effective low water depth of 35 feet, the Mersey Channel 30 feet, and in the lower portions of the Tyne 30 feet; in the Clyde up to Glasgow the low water depth is about 23 feet.

The present depth at Port Natal enables it to take any tonnage afloat with the exception of the largest liners, and those are very few and far between. Last year, of all the tonnage owned and registered in the United Kingdom, there were only two ships of 40,000 tons and over, four of 30,000 tons and over, and eight of over 20,000 tons.

It will thus be seen what a small proportion these leviathans bear to the enormous mercantile tonnage of the country. In my opinion and that of many others the extreme limits of size, at least for a very long period, have been reached.

I have to add some particulars as to the machinery and plant which one private engineering works here has which may be of interest to the Commission.*

3045. What do you say about that?—As showing the plant we have and the work we can undertake here at present.

* Note.—*The particulars were as follows:—*

Particulars of biggest machinery and plant and work which can be undertaken:—

Machinery and Plant.

Punching and Shearing.—Direct steam-driven punching and shearing machine with large gaps. To punch 1¼-inch holes and shear 1¼-inch plates.

Lathe.—27 feet between centres, 9 feet diameter face-plate, 27-inch centres.

Hammer.—One ton steam hammer.

Planing.—Machine to take 9 feet by 4 feet.

Drilling.—Radial pillar drilling machine, 6 feet radius; also electric drills.

Boring and Milling.—Large horizontal boring and milling machine.

Slotting.—Slotting machine, 20-inch stroke.

Bending.—Direct steam-driven bending machine: length of rollers, 12 feet.

Riveting.—Hydraulic and pneumatic riveters.

Oxy-Acetylene cutting and welding plant.

Work.

Castings in iron up to 8 tons.
Castings in brass up to 1 ton.
Largest forgings turned out:—
L.P. piston rod with crosshead, weighing about 30 cwt., and crank journal about 2 tons.
Coppersmith's work of all kinds, including main steam pipes of any size.
Material in Stock:—
Steel blooms up to 16 inches square.
Steel slabs up to 20 inches by 10 inches.
Round mild steel bars up to 9 inches diameter.
Steel plates up to 26 feet by ¾ inch thick.

3046. What does this tend to show?—That we can pretty well tackle any ordinary job that comes along in the way of repairs.

3047. Provided you have a dry dock?—Yes.

3048. Then this plant is now used largely in the floating dock, I suppose?—Yes.

3049. Can you tell us anything regarding the amount of custom which the graving dock, if established, would obtain?—Well, of course, the kind of custom naturally depends chiefly on the amount of casualties that occur. Naturally, no shipowner repairs his ship anywhere except in the United Kingdom if he can possibly avoid it, because the cost of repairs abroad is always larger than at home. But locally it is absolutely essential for the Administration to have a graving dock to treat their own craft. And then there is always a constant procession of ships from all parts of the world passing through here, and undoubtedly, in event of any casualties occurring on the south-east coast, the underwriters naturally prefer to send the vessels up here. I have been Lloyd's agent here for nearly a quarter of a century, and we have done a large number of big repair jobs at Durban, and last time I was at home, the secretary of Lloyd's expressed his extreme pleasure at the way the work was done here in Natal, and said that in the event of any big casualties occurring on the south-east coast it was Durban that they would look to.

3050. Have Lloyd's made any official statement regarding the desirability of a graving dock here?—No, I do not think so.

3051. Are you empowered to speak for them?—Yes.

3052. And as representing Lloyd's, you express the urgency which this matter demands?—Yes, it is extremely urgent, because we are situated in a part of the globe commanding a very big sphere of ocean traffic, and I do not know of a dry dock anywhere in Africa except at Simonstown.

3053. Now comparing the desirability of a dry dock here as compared with Cape Town, which, I suppose, is the alternative, what have you to say?—They have already got the naval dock at Simonstown, and it would be the height of stupidity to put two docks on the coast in touch with one another. We are nearly 900 miles further north here and between here and the Cape is the stormiest part of the ocean off the South African coast, and, of course, in the event of any casualty occurring north or east or south of us, we would rather bring them up here than take them round the Cape.

3054. How far are you here from Aden?—I could not give you the exact distance. I should say we are somewhere about 3,500 miles, speaking roughly.

3055. For ships that have casualties at Aden, or in the Red Sea, the nearest dry dock is where?—I understand that there is a floating dock at Aden, but there is no dry dock in Africa except at Simonstown.

3056. What is the dock accommodation at Bombay?—Very good for all kinds of repairs.

3057. So that Bombay would be your limiting factor on the north?—Yes.

3058. And Cape Town would be your limiting factor on the south?—Yes.

3059. You would cater for the zone between those two points?—Yes.

3060. **(Sir Alfred Bateman.)** Do you consider the zone more than ordinarily dangerous?—Yes, the south-east coast of Africa is exceedingly dangerous on account of the strength and uncertainty of the currents.

3061. So that would be the reason why you claim a dock here?—Yes.

3062. More than any other site?—Yes, we have not only got very strong and uncertain currents, but practically, to a great extent, an uncharted coast, especially to the north of us.

3063. **(Mr. Sinclair.)** As a shipowner, and representative of Lloyd's, are you able to say whether the development of the port of Durban, and the expenditure that is being made upon it, comes up to the reasonable requirements of shippers?—Yes, within the last ten years there has been a marvellous development here.

3064. Within a comparatively short number of years there have been expended large sums on the harbour and it is contemplated expending further large sums in deepening and improving the harbour?—Yes.

3065. You mentioned in the statement that you have given us that in Port Natal a depth 45 feet could be provided, if required?—Yes.

3066. And as apposite to that you call attention to the effective depth in the Thames of only 30 feet at low water?—Yes.

3067. **(Mr. Tatlow.)** In regard to the development of the harbour here, do you look upon the graving dock as the most pressing necessity?—Yes.

3068. And money should first be expended upon that before other developments are taken in hand?—Yes, other developments are so far pushed ahead just now that what we want is a graving dock to complete our requirements.

3069. **(Mr. Lorimer.)** We saw the floating dock yesterday with a ship under repair: does that belong to the harbour?—Yes.

3070. Is that the only existing means of repair in Durban?—Yes.

3071. As regards the statement you have put in of the machinery and plant which you have here: is this the total equipment of your harbour for the repair of ships?—No, it is the equipment of one of the private firms.

3072. Are they able to do much work?—Yes, we have been able to tackle any work up to now.

3073. Because this is a very imperfect equipment, you know?—Yes, it is far from what it might be, of course.

3074. I hardly see how they can do anything useful with this?—We have done a great deal of work so far.

3075. Do you happen to know if this single lathe is the only one they have?—No, they have others, smaller ones, and this is only one repair shop in town.

3076. So that in addition to the Government equipment, whatever it may be, you have several other shops where repairs can be effected?—Yes.

3077. But only repairs such as do not involve going into dock?—No, we can undertake big bottom repairs. We have done some very large jobs.

3078. But they would involve going into dock?—Yes.

3079. And those people who have not the dock can only do repairs that do not involve going into dock?—They are all allowed to work in the dock.

3080. Do they pay rent to the Government?—The ship pays a rent for going on to the dock.

3081. In this memorandum which you have circulated this morning you give the dimensions of the proposed dock: is that seriously contemplated?—Yes, those are the dimensions of the dock that the Government now propose to build here.

3082. Has there been a bill passed through Parliament sanctioning its construction?—They have sufficient money to pay for the cost of boring, which has been done. The first part of the estimates was 4,000*l.* to pay for the cost of boring.

3083. Provision has been made in the estimates for part of this work, so it is certain to go on?—Yes.

3084. Well, that is satisfactory, because these seem good dimensions. I am glad to see that you find from the nature of the boring that it will be quite a cheap dock as regards work?—Yes, the engineers say it is to be quite a cheap dock, with an excellent foundation.

3085. And you say there is no difficulty in providing a depth of 45 feet, if required?—No.

3086. **(Chairman.)** Regarding the depth at which it is safe to bring vessels in or out of the harbour here, have Lloyd's got any specified minimum?—No, it is all left to the discretion of the Port Captain; he is the one who is responsible for taking ships in and out and all steamers on arrival have to notify him of their draught, and he decides when to take them in and out.

3087. So the captain of the ship is absolved from responsibility?—Yes, to a certain extent. Of course, it is compulsory pilotage here, and a captain would never dream of coming in if the Port Captain said it was not safe, and, of course, the pilot would not be put on board.

3088. The responsibility is all on the Port Captain?—Yes.

TRANSVAAL.

Pretoria. Monday, 30th March 1914.

Mr. H. R. ABERCROMBIE, member of the Pretoria Chamber of Commerce, called and examined.

3089. **(Chairman.)** You are a member of the Pretoria Chamber of Commerce?—Yes.

3090. You have devoted special attention to the subject of railway transit?—Yes.

3091. Will you kindly state your evidence?—The question which I should like the Commission to consider is that of making the fullest possible use of the port of Delagoa Bay, from a South African and Imperial point of view. The distance of this port from Pretoria and Johannesburg makes it very useful indeed to the development of the Transvaal. And there is the feeling that a great deal more could be made of it than is done at the present time.

3092. Could you give the distances?—Delagoa Bay is 349 miles from Pretoria and 367 miles from Johannesburg. I might mention here that some years ago an investigation was made into the question of the possibilities and advantages of the various ports, and Mr. Conacher came to this country and ran a considerable number of trial trains in connection with the investigation. He was an expert on railway matters. Now, as a result of that inquiry, it was proved that under certain conditions this port was of much more economic value to the development of the Transvaal than the others. Under certain conditions, Durban was also a favourable port, and under other conditions there were certain classes of goods which could probably be conveyed from Cape ports economically, because in regard to this question one has to take into consideration the question of freight, and the freight is slightly higher to Delagoa Bay than the other ports. Now, we submit that in the interests of the economic development of this country everything should be done at the cheapest possible rate, because that policy will in the end have the best results for the whole of South Africa. If we can, for instance, develop this interior by getting cheap haulage of iron goods and hardware and similar things requisite for our development, we shall be able by the profit we are making in that direction to buy other goods, produce, and so on from the other Colonies, and they will, therefore, receive a greater amount of benefit in that way than they can possibly get by snatching any amount of in-transit trade on the railways. I am pleased to say from observations made recently that that view is beginning to be more taken by the people at the coast than formerly, and they recognise that everything which will assist in the development of the interior will ultimately be of benefit to the coast ports, and that the prosperity of the inland Provinces will benefit them much more than snatching a five or ten per cent. increase on goods sent over a particular line to inland destinations. Now, the proportion of that line to Delagoa Bay which we do not own is very very slight; it is only about 60 miles from Komati Poort or Ressano Garcia to the port, and taking into consideration the vast amount of money invested in railways in South Africa it is essential for us to make as much profit as we can out of the best proposition we have got. It seems to me that it is absolute folly for us to carry goods over any of the other lines which we can carry much cheaper from this particular point, and I think it is greatly in the interests of this country that we should seriously consider this, and it should be the policy of the Imperial Government to make use of that port. And further, I think the Portuguese Government is not so keen in developing their port when they feel that they can only hope to cater for a very limited section. Even the present division of traffic may be altered and made less, and it may not pay them to give such good facilities as they do at present. In short, I think that the present system is against Imperial and South African interests.

3093. How are the proportions of traffic divided between the various ports at the present time?—55 per cent. is the maximum which is allowed to Delagoa Bay—that is Transvaal traffic. When I say Transvaal, I should explain that there is a certain zone—the competitive area it is called—and that the traffic is allocated in these proportions:—55 per cent. maximum to Delagoa Bay and 45 per cent. to the Union ports.

3094. Are Pretoria and Johannesburg treated as one competitive area?—Practically, yes. Now, Sir, you can see at once that the working of this arrangement is a most awkward procedure. When the traffic gets beyond 55 per cent. or drops below, there is a great amount of manipulation necessary so as to bring the proportions to what they should be.

3095. What do you mean by manipulation? Alteration of the rates?—Yes. Meetings have to be held and discussions with the commercial community. If you have goods landed at a certain cost, that cost may vary at any time owing to the rise and fall in the percentage, and we think it is absurd and unbusinesslike.

3096. What is the alternative?—We advocate running each port on its merits, whatever the proportions may be.

3097. With a mileage rate on the South African railways?—Well the question of rates is a very intricate one as you know. The question of rates would have to be settled by experts. There is so much to be said on the subject of the bulk of the goods. As I said, also the questions of freight are very complicated, and it would take up the time of the Commission too much really to enter into questions of that kind in detail.

3098. I understand you want the abandonment of the fixed proportion?—Yes, and the ports to be run on their respective merits.

3099. **(Sir Alfred Bateman.)** You are aware of the arrangement which was made with the Portuguese Government some years ago?—Yes, the Mozambique Treaty.

3100. That arrangement is terminable in about five or six years?—Yes, I believe it will be subject to amendment.

3101. It has been amended?—Yes.

3102. That arrangement was the first real attempt, was it not, to regulate the traffic to Delagoa Bay?—Yes, I believe there had been no serious attempt before. That was the agreement between the two parties.

3103. I was here seven years ago, and as regards rates, I was told here and in Johannesburg that the railway rate had much more effect on the price of goods imported than the sea freight?—Yes, it is higher.

3104. Is that so now?—Yes.

3105. The railway rate has been reduced?—Yes, but still the railway rates are higher than the freight rates—that is taken to a point in the competitive area.

3106. You are taking, of course, your own point of view?—Yes, Johannesburg and Pretoria, where the bulk of the goods go to.

3107. Do you consider that your railway rates are too high?—Yes, they are too high.

3108. They are too high as affecting your cost of living, but to compare them with other rates, what do they work out at?—They are considerably higher, I think, than in most other countries, even taking the case of Australia and Canada. Anyhow, the rates here are too high and one of the reasons, if I may be allowed to elaborate a little, is because the ports are not run on their merits. Our costs are too high on certain articles brought from ports where they should not come from.

3109. The natural railway rate from Delagoa Bay would be a lower figure than now?—Oh, much lower, if that port was worked to its fullest extent and we should be able to reduce rates considerably.

3110. The rates are constructed with the object of stopping more than 55 per cent.?—Yes, they are very high on that bit of line, and proportionately lower, owing to longer distances, on other lines.

3111. Do you know what the view of the Portuguese authorities is in regard to this arrangement?—Well, I had a conversation with the Governor there two or three years ago, in the course of which he told me that he was so dissatisfied with the state of affairs there that he had recommended the Portuguese Government not to proceed with any great developments at the port. He felt that they were so penalised as against other ports in the country that they were not justified in going to any great expense in connection with the port, and the port has, as you know, not been so successful as it might have been, because it is short of many handling appliances. They have certainly improved it during the last year or two, but it is not equipped to anything like the extent of the Union ports, and it never will be, I think, while it is under the present disadvantages.

3112. But they can deal with all your large goods, can they not?—Yes, heavy material.

3113. Of which you have, I suppose, enormous quantities for the mines?—Yes.

3114. To handle those goods requires very superior cranage?—Yes. I was thinking more particularly of the dredging operations, and the extending of their wharves, and things of that kind.

3115. So your desire is to get a reduction of rates from Delagoa Bay?—Yes.

3116. And do you want any reduction from Durban?—Yes. As I say, we want to get the very lowest possible rates we can from whatever port is concerned, consistent with the cost of haulage.

3117. But you are favoured in some ways, are you not—favoured in regard to the export of coal to the Cape, for instance?—No, we do not ask for favours. As business men, we want things to be run on economical business lines. We do not want a rate to the Cape which is so highly unpayable that the taxpayers who are interested may have to make up the difference, and we do not want an upward rate which has the same effect. We want everything to be taken into consideration—railway practice in regard to blanket rates, and so on. We want these rates worked out on proper lines.

3118. You want the rate that it costs as far as possible?—Yes ; consistent, as I said, with railway practice generally. Supposing you are growing a certain article in California that is wanted in New York, they give that a special blanket rate in America. It may not be quite a payable rate, but the article is wanted at the other side, and there may be a certain number of trucks available, which are not carrying goods at the time. They might justify a very low railway rate in that case, but a very low railway rate to Cape Town, for instance, will not be justified when you want those trucks for better and more payable traffic if that rate is unpayable.

3119. That rate is very low, is it not?—Yes, I consider personally that it is an unpayable rate, to Cape Town.

3120. So that you do not support it?—Personally, no. I personally favour the coal going to Delagoa Bay, and the Union Government chartering their own tramps to take the coal round to Cape Town. It is much more economical, and it releases trucks which are wanted here for other purposes. In fact, the coal mines have been grumbling that they are short of trucks, and are not able to work up to their full output.

3121. Then they are not as thankful as they ought to be for this low rate?—Well, not if those trucks are kept at Cape Town.

3122. So I gather that you want lower rates for goods generally, both from Delagoa Bay and Durban?—Yes.

3123. And you do not altogether favour these rather preferential rates that you have on coal to Cape Town?—We prefer that everything should be carefully worked out on its merits according to the American railway practice.

3124. **(Sir Rider Haggard.)** Under the existing arrangements with the Portuguese, what duty, if any, is charged on goods in transit to the Transvaal?—There are no special duties. The goods come in and have just the same benefits as they have under the Union ports. It is the in-transit traffic which they have to cater for in that way.

3125. What do you say is the exact difference in mileage between Pretoria and Delagoa Bay and Pretoria and Durban?—The distances are :—Pretoria to Durban 512 miles as against 349 to Delagoa Bay, Johannesburg to Durban 486 miles as against 367 to Delagoa Bay.

3126. **(Mr. Sinclair.)** Is your suggestion that at the expiry of the Mozambique agreement the system shall be changed, or do you suggest that it should be interfered with during its currency?—My suggestion is that it should be amended as soon as possible, during its currency.

3127. Would not that involve breach of faith in the absence of agreement?—There would have to be mutual agreement, of course.

3128. If the agreement were cancelled, there would have to be some *quid pro quo*, I take it?—We should have to consider all parties concerned in a fair manner.

3129. And revise it by mutual consent?—Yes.

3130. Is there a willingness, so far as you know, to revise the agreement at the present stage?—I think there is from all sides. I think there is a better feeling on that subject. Mr. Haarhoff, a representative of our Chamber, informs me that there is to be a revision of certain points during the next three months, so that apparently the agreement may be modified by mutual consent from time to time.

3131. Has your Chamber exhaustively gone into the question of what freights would be saved to Pretoria and Johannesburg if there were competition?—We have not got the exact figures. But the sum is very considerable. The figures, which would interest you, were got out by Mr. Conacher some years ago, and they would give you the percentage of the difference.

3132. Is there any statement of the position brought up to date?—No, unfortunately not. Owing to the unfortunate port jealousies we have had great difficulty in getting these figures, in fact we have had, to some extent, really to construct our own position. But there is no doubt a tremendous difference.

3133. Mr. Conacher's report is some years old, you say?—Yes, but the cost of running the trains remains the same, practically. If anything, they are improved in favour of the route, because there has been a deviation. Formerly, they had a rack engine from Waterval Boven to Waterval Onder, but they have now done away with that and they have consequently brought down the cost of that line.

3134. But you are satisfied that if the competition which this artificial system eliminates were not interfered with on these different lines it would benefit the

whole community?—I am satisfied. I also wish to say that I think Durban is unfairly treated, too, in some ways. There is an artificial rate charged to Mafeking, for instance. What I mean to say is that the beginning of that artificial system leads to many other artificial rates being charged.

3135. I do not want to go into any question of details between point and point, and that is why I ask the question in the form I do, that, broadly speaking, you think that the interests of the whole community would be served by a reconstruction of the existing arrangement?—Yes, I certainly think so.

3136. **(Mr. Garnett.)** I gather that you would not like to see any renewal of this arrangement as between the different ports dividing the traffic. You think it artificial?—I do.

3137. You would prefer to see the trade, having found the line of least resistance, follow that line?—Yes.

3138. You think that would tend to the development of the whole country?—Yes.

3139. And that being so, any loss of traffic that might ensue to some of the ports affected, would be more than made up by the traffic they would get through the development of the country?—Yes.

3140. And you are of opinion that in striving after these small percentages of trade it is something like grasping the shadow and losing the bone?—Quite so.

3141. You favour full and free competition between the ports, so that those most suitably situated for serving the country should get the bulk of the traffic?—Yes.

3142. And your belief is that that would tend to the prosperity and development of the whole of South Africa?—Yes.

3143. **(Mr. Bowring.)** Does none of the Transvaal coal find its way out *viâ* Delagoa Bay at the present time?—Yes. Delagoa Bay is the port at which the ships bunker. The object of coal going down to Cape Town is to catch ships which do not call at Delagoa Bay.

3144. Then ships do bunker at Delagoa Bay?—Oh, yes, it is a large and increasing business.

3145. The coal which finds its way down to Cape Town by rail has to go what distance?—About 1,000 miles.

3146. As against about 350 to Delagoa Bay?—Yes.

3147. And you claim, of course, that coal could be carried so much cheaper by steamer than by rail?—Yes.

3148. And if you had a free outlet by Delagoa Bay there would be great economies?—Well, of course, that is a matter of policy of the present Government. Mr. Burton told me that he was considering the question as to whether that would not be cheaper. I am in favour of that policy; they may also be in favour of it later on.

3149. It is under consideration?—Yes, I believe it is under consideration at the present time.

3150. **(Mr. Tatlow.)** If this agreement were not in existence which gives 55 per cent. to Delagoa Bay at present, and if the port had fair play quite unhampered, what would that 55 per cent. be transformed into, do you think?—I think, speaking roughly, it would go up to probably 70 per cent. It went up to 88 per cent. once before Union. But it depends to a great extent, also, on the freights and the efficiency with which the port is handled.

3151. What are the other ports concerned in the arrangement?—Port Elizabeth, East London, Durban, and Delagoa Bay.

3152. And Delagoa Bay is more favourably situated in regard to distance?—Yes, for the competitive area I mentioned

3153. And, naturally, Delagoa Bay would like to see that route unhampered?—Yes, naturally.

3154. The determination of the agreement would be in their favour, would it not?—Yes.

3155. Provided the Railway Department pursued its policy, which I believe it is pursuing, of equalising rates all over the country?—Well, of course, the Portuguese Government are in a very bad position in regard to that port, and that is where there is a good argument for the other ports in that way. We have them, so to say, as three cards against one. The Portuguese cannot put up their rates, so we have them in the hollow of our hands in that way; but at the same time I am asking only for fair business.

3156. It is to their interest to keep the rates as low as possible?—Yes.

3157. An unhampered condition of things would be best for them?—Yes.

3158. You said these rates were altered from time to time so as to keep as near as possible to the artificial arrangement of 55 per cent., and you said that some council arranged that. By whom is that arranged?—The Railway Board have meetings at which they arrange the rise and fall in the different rates to equalise.

3159. Does the Railway Board bring in anyone from outside to consult with?—They consult with the Chamber of Commerce, as a rule.

3160. Have the Chambers of Commerce a seat on the consultative Board?—No, they are consulted unofficially.

3161. But they are regularly consulted in regard to these rates?—No, not regularly, but at intervals. Sometimes a payment has to be made to equalise the rates. For instance, if the rate for Delagoa Bay drops considerably, then the Portuguese Government can claim, I understand, a cash payment, which is very much against their interests. We pay two ways then.

3162. Was it Mr. Conacher's enquiry that led to the adoption of these proportions under the agreement? Was he concerned in that?—No.

3163. What was his office?—It was extremely difficult to get at the real position. There was a tremendous agitation in connection with this question at one time, and an independent expert was asked to come and go into the whole matter.

3164. Was that before Union?—Yes.

3165. He was asked by your Government?—I think by the Transvaal Government, and the others were a party to it, because the report was submitted to each Government.

3166. I saw the report at the time. It was about ten years ago?—I do not think it was so long as that.

3167. **(Sir Alfred Bateman.)** In 1905, was it not?—I should say in 1906 or 1907. Because it was just about the time when the first Transvaal Parliament met. That is when I date it from.

3168. **(Mr. Tatlow.)** Something between seven and ten years?—Yes. But the feature of it is, of course, that the cost of working the railways has not varied very much. I mean there is no great alteration in the wages and the cost of coal and wear and tear. He went into this question very elaborately, and submitted a very good report. I wish we had some men of that type in South Africa. He was one of the best railway men I think I have ever had the pleasure of reading a report from.

3169. He is, unfortunately, dead now. You spoke of your rates being excessively high, and increasing the cost of commodities here and in Johannesburg?—Yes.

3170. Have you not participated in the large reductions made in the rates during the last few years?—Well, I do not think myself that those reductions were made in the best way. Supposing you take one farthing or one penny off an article, the consumer does not get much benefit, as a rule. I think it would have been much better if those reductions had been taken and applied to one or two articles which are in frequent demand, for instance, building material is one of our chief lines. The cost of buildings to-day is excessive, and timber and iron are two of the things on which, if we had an adequate reduction, we should see a great effect. The reductions have been spread over too many things and they have been manipulated in another way. Low rates have been given on certain lines. Certain people have preference. There are certain lines of produce in this country which are run at unpayable rates, in my opinion, and a good deal of

the profits which the railway have relinquished in this way has not gone into the pockets of the people in the interior but into the pockets of people who live far away from the interior, possibly. We have had to pay on that, and what is still more, our economic development has suffered. And that is not all. We have to pay something like half a million to the Consolidated Revenue Fund, being interest on money which we have already paid off on the cost of building our railways. We in the interior have to pay that. Of course, it is really killing the goose that lays the golden eggs. There is something like one million of money taken out of the interior of this country in the shape of these items I have given and the loss on the harbours, which falls principally on the inland community. Well, you can see in a community like this, it becomes a serious item in regard to our development. They do not realise that they are stifling the development of the country. If they did away with these anomalies we would go ahead so much quicker, and they would get the benefit in a different way.

3171. We understand from the General Manager of Railways that he is giving great attention to the removal of these anomalies. Preferential and unequal rates are what they are striving to rectify?—The General Manager of Railways is unfortunately in this position. He is subject to the Board, and also to the Minister, and the whole thing is somewhat subject to political influence. Take the question of these preferential rates: I do not think we shall get any relief from these or very little, because of the enormous political influence that can be used to keep those rates in force. The solution that we have advocated is that the Railway Board should consist of experts, who should not be interfered with, except by Parliament, and then it should be a very serious matter. Unfortunately, that is not so. We have the General Manager of the old Transvaal lines, the General Manager of the old Cape Government Railways, and a Natal representative, who has just recently made way for another Natal representative, and the Portuguese have also something to say from the outside. I submit to you, is that a business-like arrangement? That is our complaint. You cannot arrange these things as they should be.

3172. **(Chairman.)** You want commercial rates—not political—is that it?—Yes.

3173. Now what are the port facilities at Delagoa Bay; what draught of water?—It can take vessels at the quays drawing 30 feet, the entrance channel has only 21 feet at low water, but the tide varies from 6 to 10 feet and the channel is being deepened to 26 feet. The Port is a splendid one and well sheltered.

3174. In your evidence you put Johannesburg and Pretoria in the same boat?—Yes.

3175. But their respective distances from the two points are somewhat different?—Very slightly different. Johannesburg has a branch line from Witbank. Our line comes straight from Delagoa Bay, and theirs comes across. If you take the area from Springs to Krugersdorp, there is a small difference in our favour.

3176. You are slightly nearer Delagoa Bay, and how much farther from Durban?—Germiston would be the central point of the Witwatersrand area—we are about 35 miles.

3177. And in that case there is no short cut possible? You must go through Germiston to get to Durban?—Yes.

3178. **(Sir Alfred Bateman.)** Are the gradients to Delagoa Day favourable?—Yes, on the whole. The gradient is very favourable with the exception of one point—Waterval Onder to Waterval Boven. The railway department have effected some improvements. There used to be a rack railway there, but they have done away with it now, and that is the only difficult point I know of on the whole line.

3179. What is the gradient? Mostly 30?—I could not say, but it is an easy gradient, with the exception of the one point to which I have referred.

3180. And as compared with the line to Durban?—Yes, more favourable from a gradient point of view.

3181. **(Sir Rider Haggard.)** Is the ownership of the line to Delagoa Bay the same as the ownership of all the other lines in the Union?—Up to Ressano Garcia, and after that it belongs to the Portuguese Government. You will perhaps remember that the Portuguese Government forcibly expropriated the railway company during the Kruger régime.

3182. And it is still theirs?—Yes.

3183. So there is a dual management of that line?—Yes. They control 60 miles, and we control the balance. I think it is practically under the South African Railways. I think they practically control it.

3184. At any time the Portuguese Government could assert the right to close the line if they wished?—Yes.

3185. **(Sir Alfred Bateman.)** Not under the agreement?—No. I meant by *force majeure*, I suppose they had some Power assisting them to do such a thing.

3186. **(Sir Rider Haggard.)** The line is, anyhow, not in the same position as that from Durban?—No. But, of course, considering the position of the State concerned, we have no fear of that at all.

3187. **(Mr. Garnett.)** So your general point is that any natural advantages that Delagoa Bay possesses as a seaport, are more than counterbalanced by the railway rates which are charged?—Yes.

3188. And that is what you object to?—Yes.

Johannesburg. Friday, 3rd April 1914.

Mr. HOWARD WALLACE SOUTTER, Mr. ALFRED FALKLAND ROBINSON, and Mr. E. CHAPPELL, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p.* 46, *on "Posts, Telegraphs, and Steamships," p.* 81, *on "Bills of Lading," p.* 91, *and on Empire Development," p.* 161, *of this volume: and on "Exhibitions," see p.* 124, *on "Statistics," p.* 130, *on "General Trade Questions," p.* 173, *and on "Legislation," p.* 183 *of* [*Cd.* 7707].)

3189. **(Chairman.)** I think the most convenient course would be for you to read your memorandum on the subject of railways?—**(Mr. Soutter.)** Yes. Our first memorandum is dated 4th February, and that is supplemented by a statement by Mr. Robinson. I will read the memorandum of the 4th February.

The memorandum was read, and is as follows:—

Railways.—Statistical information regarding the railways of South Africa will, no doubt, be supplied to your Commission by the Government.

The Chamber cannot refrain, however, from adding that the development of this country has been retarded by the system of imposing taxation through railway rates. This has conduced to the excessive cost of living, the heavy wage account, and the expensiveness of material, which together have hindered the industrial development of the interior.

Notwithstanding that under the Act of Union (section 127) the railways are no longer to be run on a revenue-producing basis, in actual fact, however, the rates are so arranged that the consignees in the inland centres have to pay excessive rates in order to make up losses on the working of the harbours and on the non-paying railway lines in the coast Provinces. This

is considered by the Chamber not only to be inequitable, but also to be inimical to the proper exploitation of the country's resources.

(Chairman.) I will now ask Mr. Robinson to read his statement dealing with railways.

Statement read as follows:—

Railways.—In dealing with this subject we propose to confine ourselves to the special features affecting the inland community and the disabilities under which we have lived and are living due to the exorbitant rates prevailing on the railways.

For many years the Johannesburg Chamber of Commerce has advocated a revision of the excessive railway tariffs, which form such a heavy burden upon those sections of the community living in the inland portions of the Union and especially upon the industrial population of the Witwatersrand area, described in the Railway Tariff Book as the competitive area, a title which has been well earned, for since the Rand and its gold mines were discovered the large traffic to this centre, carrying as it did and still does the enormous railway profits, has been ever the object of the keenest competition between the various coastal railway administrations.

Enormous expenditure has been incurred before Union by the lines mentioned and the harbours feeding those lines, in order to obtain and retain this very profitable traffic, and the community of the so-called competitive area have had to pay—with the inevitable result that it has not been found possible to establish local industries which might and should be worked within its own areas.

To give you some idea of the burden placed upon the inland population, we need only mention the following:—

In 1905, before Union, the gross earnings of the Central South African Railways, Transvaal and Orange Free State, were 5,364,691*l.*, to which must be added 2,524,782*l.* derived by the Cape and Natal in that year from the conveyance of traffic to and from the Transvaal and Orange River Colonies, bringing the total expenditure incurred by the public of these two Colonies for railway travelling and freight to close upon 8,000,000*l.*, or approximately, 20*l.* per head of the then white population, the great bulk of the burden falling solely upon the industrial section of the population.

In 1911, after Union, the South African Railways earned a net profit of 2,460,118*l.*, after paying interest on the capital; of this profit, 1,804,317*l.* was earned on the Transvaal section of the railways, and it should be noted that the sections in the Cape, Free State, and Natal, which earned the greater portion of the profit in those Provinces, were sections of the trunk lines to the competitive area.

One section of line in the Transvaal, viz.:—Germiston—Witbank, 80 miles in length, capital cost, 1½ million, earned in that year a net profit, after paying interest on the capital, of 701,200*l.* The bulk of the coal traffic to the gold mines is carried over this line.

The Act of Union (section 127) provided that after May 1914, the railways shall be administrated on business principles and not as a revenue-producing machine. During the past year or two some amelioration in the rates has been effected, but it is clear that even if the South African Railways show no surplus profit for revenue, the traffic to the competitive area will still have to pay the enormous losses incurred on nearly all the branch railways, especially those in the Cape Province.

There are many rates in the tariff book which are quite incomprehensible; for instance, the Union Steel Works at Dunswart, about 20 miles east of Johannesburg, pay 43½*d.* per 100 lbs. to send steel bars to Kimberley; the same bars are conveyed from Johannesburg to Kimberley at 14½*d.* per 100 lbs.

Preferential rates are another feature of the tariff book which our Chamber has always opposed, many articles, such as blankets, schoolroom furniture, iron and wood pipes, bacon, soap, &c., being carried at considerably less rates in the Cape Province and Natal than they are over similar distances in the Transvaal and Orange Free State; while the rate for imported sugar, wheat, and flour is more than double that for the same commodities produced in South Africa.

Johannesburg has always been debarred from taking full advantage of that port which, geographically speaking, is its natural inlet, viz., Delagoa Bay; the rates being so fixed as to divert all but the heavy and rough goods to the Union ports; while it may be argued, and rightly so, that our Union ports should receive preferential treatment, it seems inequitable that this should be done at the expense of only one section of the community.

It may be of interest to the Commission to learn that the whole capital from the Portuguese border to Germiston was paid for out of profit in somewhat less than four years; this was effected in spite of the fact that the operation of the Transvaal—Mozambique Treaty (1909) reduced the percentage of tonnage of oversea goods imported by Delagoa Bay from 66·03 per cent. in 1910, to 55 per cent. in 1912, with the consequent loss of profit.

The condition of affairs indicated above will largely explain the almost total absence of local industries other than the mining industry in the inland centres.

3190. **(Chairman.)** In regard to the railway rates affecting the establishment of local industries, have you any definite figures that you could give us? Your statement is rather vague.—**(Mr. Robinson.)** We have figures to support our statement which we can send. We can send in a definite statement showing the loss on the lines of the Cape Province and the other various sections of the railway concerned.*

3191. **(Mr. Sinclair.)** I have a few questions to ask as to railways. Is it the suggestion that the system of working the railways and the harbours together is not a good one?—**(Mr. Robinson.)** This Chamber did not approve of working the harbours and railways together—or, rather, the railways taking over the entire control of goods direct from the ship's side.

3192. After having fully considered such an important question, has your Chamber delivered itself of any resolution on the subject? Has there been uniformity as to the attitude of Chambers?—A resolution was carried by a large majority in regard to the doing away of forwarding agents at the coast and the handling of goods by the railway.

3193 The suggestion put before us particularly, take it, is that the railways should be regarded as a public convenience, and as they are built largely by money that has been borrowed it should be enough if they are able to produce approximately the amount necessary to cover interest and charges. Is that the suggestion?—**(Mr. Robinson.)** The suggestion is that they should be used to cover maintenance, betterment, renewals, depreciation, and interest on capital, but not to be used as a means of earning revenue for the Consolidated Fund or for the purpose of carrying out the administration of the Union. May I read a resolution that was carried on the question of the railways handling the goods at the ports? It reads as follows:—

"That in the opinion of this Chamber the adoption of
" the suggestion that the South African Railways
" should undertake, in respect of goods sent forward
" in bond, the duties now being carried out by the
" forwarding agents for the ports, would be an un-
" necessary interference with private enterprise by a
" Government Department, and that, in fact, if carried
" out, it would be a Government monopoly, and the
" inland commercial community have expressed no
" desire for such a change. It would lead to conges-
" tion and delay at the Customs House, and this
" Chamber is, therefore, opposed to any such action
" being taken by the Railway Administration."

* These documents, which were afterwards supplied, were:—

(1) A memorandum dated 16th February 1912.

(2) A letter dated 1st February 1913 to the Minister of Railways and Harbours.

(3) A copy of the evidence presented to the Economic Commission on November 21, 1913, by the Johannesburg Master Builders' Association (*see* the South African Master Builders' Federation Journal of February 15, 1914).

3194. You think it would be in the interests of this part of the Union if it had greater facilities to avail itself of Delagoa Bay as a port?—Yes, we think so.

3195. The existing condition of things has been brought about by an agreement that is still current, has it not?—Yes, an agreement entered into by the Transvaal Government shortly before Union, based upon the *modus vivendi* entered into by Lord Milner after the war.

3196. Is it the case that the working of such an agreement must in a sense be experimental, and that when it runs out—or by agreement before it runs out—if it is found that it is not working well, or if it is pressing unfairly on any particular centre, that experience will result in modification of its terms? That is, I take it, what you look for, is it not?—The position of that agreement is that it was based on a great many ulterior motives besides the question of making use of Delagoa Bay as a harbour, and one of the greatest drawbacks that the agreement has had, as far as the inland commercial community is concerned, has been the chopping and changing of the rates to other ports in order to keep more or less to the percentages guaranteed to them under that agreement.

3197. Those are alterations made to carry out the spirit of the agreement?—Yes, which have been very irksome to the inland community, because we were never sure from one day to another what the rates were going to be from Durban, East London, or Port Elizabeth, while the rates from Delagoa Bay have practically remained the same ever since the war, and these other ports have been varying their rates to such an extent that merchants carrying large stocks in Johannesburg have often found themselves heavily penalised through a reduction of rates from one or other of the ports.

3198. I take it your suggestion is that the agreement should be modified as soon as possible. I understand that you do not complain of the spirit of the agreement being carried out as long as it exists?—Yes.

3199. Your object is to try to get a speedy revision of the agreement for the reasons you have put before the Commission?—I think our object would be gained entirely if that agreement ceased to exist, provided we were then given an opportunity of getting our goods on a basis which is more in keeping with the mileage rates that we should get from Delagoa Bay, rather than having to get our goods considerably further from these other ports. The rates under the agreement are altogether too high, to start with

3200 1. That is a matter which will come up for review in the ordinary course of things when the agreement itself comes up for review?—Yes. **(Mr. Chappell to Mr. Sinclair.)** May I add something in regard to railways? You pointed out that our railway conditions are largely governed by the Mozambique agreement, but another point that I should like to make, supplementary to Mr. Robinson, is this, that the terms of the Mozambique agreement might be equally easily observed if the rates of railway freight were on a lower basis than they are to-day.

3202. **(Chairman.)** You would lower both?—Yes. The *pro rata* could still be maintained. If I could put before you one or two extraordinary positions it might help you to see our point of view. Take "Classification No. 2." The rate per ton per mile from Algoa Bay, that is Port Elizabeth, is 1·86*d.* The rate per ton per mile in the same classification from Delagoa Bay to Johannesburg is no less than 3·27*d.* Now our distance from Algoa Bay is 713 miles and Delagoa Bay is 367 miles. If 1·86*d.* is going to pay *viâ* Algoa Bay then obviously something very much less than 3·27*d.* is going to pay the other line. Put in another way, the matter appears like this. Taking Classification No. 2, the railage from Algoa Bay to Johannesburg is 5*l.* 10*s.* 5*d.* per ton. The railage from Delagoa Bay on the same kind of goods is 5*l.* per ton, but if the rate from Lourenço Marques were on the same basis per ton per mile as Algoa Bay, it would only cost 2*l.* 16*s.* 10*d.* per ton.

3203. **(Mr. Sinclair.)** Would a mileage rate operate fairly?—I quite admit the mileage rate is impossible under the agreement. I only mention it to show the extraordinary discrepancy. But it would not be impossible to lessen the burden on this community very materially, even while observing the conditions of the Mozambique agreement, by reducing the rates all round *pro rata* to the present basis.

3204. **(Mr. Tatlow.)** In regard to harbours, do you not think there is an advantage in efficiency and economy by them being worked by the Railway Department—quite apart from the question of the forwarding agents which you mentioned?—**(Mr. Robinson.)** When we discussed the matter the feeling we had was that the Government would thereby establish a monopoly in working these harbours and railways, and that after they had established that monopoly and the forwarding agent had disappeared we should suddenly find ourselves face to face with some excessive charges for doing the work. That was the feeling we had in our minds when we passed the recommendation.

3205. It is desirable, is it not, to see the harbours run as economically as they can be, and the railways and harbours have a great deal in common in regard to handling and working the traffic. Do you not think that such handling and working could be done more economically by the Railway Department?—We do not believe in the principle of Government trading. There is no doubt about it that the Railway Department would be able to work more economically, but the experience we have had in the past has been of such an unfortunate nature when the matters have got into the hands of one big administration such as the Railway Department. They have made use of their position to tax us most inequitably.

3206. But will not the working of the harbours come under the same conditions as the working of the railways, that is, that they shall be worked on business principles and shall not earn any excess of revenue over what is necessary for maintenance and interest?—Well, we have, up to a few months ago, experienced the fact that the losses on the working of the harbours have been paid for out of Railway revenue, and as I indicated in my statement, the whole revenue of the railways practically is drawn from the inland industrial population; so we have not only to pay the high charges on the railways, but also for the losses on the harbours, which the population living at the coast benefit from equally with ourselves.

3207. But I think we had evidence from the General Manager of Railways that the charges on the harbours were to be equalised and brought up to a point which would make them pay?—We are aware that a conference has just been sitting in Cape Town with that object in view, and the attitude which our Chamber took up was that if they put the harbours on a paying basis, to run on their own bottom, they should make a corresponding reduction in the railway rates, because they would be saving the allocation which they formerly had to make out of railway revenue to help the harbours, and we therefore desired to see the proposed alteration in the harbour rates reflected in a corresponding reduction in the railway rates. The losses last year on the harbours amounted to 240,000*l.*, which money was paid out of railway revenue.

3208. In regard to the question of railway rates, your complaint is that the rates to this district and the inland parts of the Transvaal are excessive compared with other parts of South Africa?—I do not think we said that the rates themselves, compared with the rates to other parts of South Africa, were excessive, because I believe the rates in some other parts of South Africa are even higher per ton per mile than the rates to Johannesburg.

3209. Excessive *per se*?—Yes, and when you consider the enormous volume of traffic going to one centre we believe we should have the benefit of the reduced cost of haulage. As I mentioned, certain articles are carried very much cheaper in Natal and the Cape than in the Transvaal and Free State. Those are what are termed preferential rates. But, speaking generally, while the rates to the so-called

competitive area—over what they term the main trunk lines to the north—are perhaps cheaper per mile than some others, we consider they are by no means so cheap as they should be, considering the immense volumes of traffic carried to one centre.

3210. Do you consider that a town which has a greater volume of traffic than another town should have cheaper rates?—Yes.

3211. Well, it is rather a novel principle in fixing railway rates, to give lower rates to towns and districts which have a higher amount of traffic than others?—Well, we have the experience of countries like America and towns like Chicago, which have been practically built up on the basing point rates.

3212. I suppose you saw the evidence of Mr. Hoy that a great many of the preferential rates had been abolished, and there were only some 26, I think he said, now existing, and he stated that the Railway Department were largely engaged in assimilating the rates and putting them on a fair basis throughout the whole of South Africa?—Yes. We are aware that Mr. Hoy is personally very much opposed to these preferential rates, and I have no doubt he is making every effort to abolish them. But the fact remains that to-day they exist, and in a great measure they are due to political influences.

3213. I understood from him that in a reasonable space of time all these inequalities will disappear and fair rates will be adopted?—We can only hope that Mr. Hoy will be able to carry out his intentions, but when you have to deal with such articles as sugar and the interests of the Natal sugar-growers and others—interests which are applicable more or less to one section of the country—it is a very difficult matter to get the Government to agree on principles.

3214. And again you say it has not been practicable to establish local industries on account of high rates?—That is so.

3215. Have you any definite cases in which this has happened?—We can give you cases. There is the case of steel construction work, for instance. That is a thing which is very largely required in this country, and the business has in a great measure all gone down to the coast, principally on account of the high cost of the raw material and the wastage of same on which they have to pay railage if the construction is made in Johannesburg as opposed to the coast. I must also confess that the cheaper wages which are paid at the coast no doubt have influenced this question as well as the high railway charges to this centre, but I think that of these two factors the high railway charges have the more important bearing on the fact that these industries are at the coast. We have this great disadvantage in regard to many of the rates, that raw material is carried very often at the same rate as the finished article, or with only a very small difference, and entirely out of proportion to what it should be.

3216. I suppose you look forward to further substantial reductions of the rates as the surplus earnings of the railways increase?—We hope so, but we find in the past they have so juggled—if I may use that term without offence—with the results of the working of the railways that they have shown no room for any further reduction. We have been hoping to see reductions of rates made out of these millions of money earned by the railways in the last year or two, but we have been rather disappointed. We do not think that the railways should any longer be employed as a revenue-producing machine.

3217. But it does not follow that you will not have those reductions in future if your railway traffic increases considerably, and the country prospers, because the earnings of the railway will, under the Act, be applied to reductions of rates?—We only trust that they will apply those reductions to this competitive area instead of to the wine-growing district of the Western Province, for instance.

3218. That is what you will press for?—Yes, certainly.

3219. **(Sir Alfred Bateman.)** On the subject of railways, what balance did you say it had been juggling with?—I did not use the word in an offensive sense.

3220. What was the point?—We had the sum of 460,000*l.* odd passed by a committee in the House and charged as interest on capital, which was really not capital in the ordinary sense of the word, which should have borne interest, because it was the cost of certain railway lines which had been built out of profits. The capital of the railways at a certain date was something like 73 million pounds. About two years ago the Select Committee on Finance suddenly decided to make the capital 86 million pounds and to charge an amount of 460,000*l.* odd to interest out of revenue owing to the creation of this additional capital.

3221. Was that an arbitrary figure?—No. It was the actual interest on the same basis.

3222. But had all that money been spent as capital? Had it been raised as capital?—No.

3223. Was it raised out of profits or savings?—Yes.

3224. That was used as capital and now it has been put in as capital?—It is now charged as capital. The Union exchequer does not pay interest on that money, but the railway is charged with the interest all the same.

3225. But they did not borrow it?—They did not borrow it. **(Mr. Soutter.)** But the point is this, that this was expenditure out of profits for capital purposes and on that amount interest is charged and deducted from profits, so that the profits are paying interest on their own profits. **(Mr. Robinson.)** That is one of the reasons why the profits which have been made in the past are gradually diminishing through this form of keeping accounts.

3226. In regard to this railway evidence, I am perhaps as well acquainted with the position as anyone else except those who live here, because I was here seven years ago on the Shipping Freights Commission and I heard much the same complaint. The Mozambique agreement had not long been made then. It seems to me it is not so simple as you say. They could not allow that all your trade must come through Delagoa Bay. Do not you admit that there is a duty which Johannesburg owes to the other Union ports?—We certainly do.

3227. These rates were carefully calculated so as to secure certain percentages to Algoa Bay and so on?—Yes, that was in the Mozambique Treaty—the *pro rata* basis of traffic.

3228. At that time there was always considerable trouble. Sir Donald Currie used to be juggling with the freight rates to Delagoa Bay and Durban and so on, and that was corrected by the Government raising or lowering the railway rates so as to keep the same proportions between the ports—the same percentages. It is ancient history now, and I do not think we need go into it, but when this agreement comes to an end you will probably get these matters remedied?—Every ton of goods transferred from Delagoa Bay to Durban means a loss of revenue to the Union. It may assist the port of Durban and the Natal section of railway, but it means an actual loss of revenue, because there is more profit made by our railway on goods hauled from Ressano Garcia to Johannesburg than on the goods hauled from Durban to Johannesburg.

3229. I am afraid this Commission will have some difficulty in making recommendations between one port and another?—**(Mr. Chappell.)** There does not seem much difficulty in making recommendations that the whole basis should be lowered; you can keep the *pro rata* differences just the same.

3230. What I understand you complain of mostly is that the railway rates here should be burdened with the losses sustained by working the branch and costal lines?—**(Mr. Robinson.)** Yes. That is our contention.

3231. Well, it has occurred to me that unless you deliberately elect to make Delagoa Bay your only means of communication with the outer world, your traffic must go over these expensive coastal lines which are so heavy to work—and, therefore, it is quite reasonable that you should bear a share of this, is it not?—The through traffic on those lines from the coast pays very well indeed, whether it comes from Delagoa Bay, Natal, or the Cape.

3232. I do not know what is the proportion of the unprofitable branch lines to the whole mileage system, you may be able to bring that out in your statement which you are going to send in. But at the same time there are conditions affecting the working of these lines, I understand, which make the working of them more expensive than those up here in the flat level country, and, of course, the maintenance must be excessive as compared with the others?—We do not think that is the case, because whatever comes up to this altitude must be hauled from the coast, whether Delagoa Bay or Cape Town or Durban or East London, it all has to climb up to the same altitude.

3233. Does the traffic from the Cape pay more per ton per mile than from Delagoa Bay?—No, the traffic from Delagoa Bay pays much more per ton per mile than from the Cape or Natal.

3234. So that is in your favour?—But we do not know what the cost of that traffic is to haul, and we have not been able to obtain any figures to show what it costs the Administration to haul the traffic.

3235. Have you figures to show the cost of working the railways in each of the several Provinces?—Yes.

3236. Those are authentic?—Taken out of the General Manager's Report.

3237. I have never seen any accepted general statement of working published by the Railway Department. Now the only point I want to get at is this: There have been many large reductions made in the last year or two in anticipation of the statutory date when the railways are to be worked without profit, and so far the effect is this, that the Minister told the Parliament a week or two ago that he was within sight of a deficit for this year. Now, if there is a deficit on the working of the railways it has to be made up out of the general taxation. We heard the other day that the Rand pays half the general taxation of the Union?—Yes.

3238. Well if you had to pay in addition to your present taxation half of the loss on the working of the railways, would you be better or worse off than under the existing railway rates?—We should be very much worse off, but with regard to the reductions which Mr. Burton referred to, they cannot be the cause of the deficit on the railways, because those reductions only amounted to something like one and a quarter millions, and they were by no means applied to this competitive area in its entirety. Some 750,000*l*., was the estimated reduction due to the reduction of certain railway rates. But we do not think, for a moment, that that figure has ever been obtained in actual practice. The losses that are made on the railways are due chiefly to the agricultural branch lines, which have practically little or no traffic, and which is carried at ridiculously low rates, and with very uncertain volumes. And it is for those losses which the railway may eventually have to return a deficit that we have to pay. If in addition to the high rates that we are paying, we have to share in the deficit in the general taxation of the country, we shall be very much worse off in future than we are now.

3239. **(Chairman.)** You stated that the branch lines to the agricultural districts make the losses and that loss your traffic has to pay for?—That is what we maintain, and we shall submit you a detailed statement* showing the detailed losses for the various sections of the railway branch lines, and otherwise.

3240. But I think you take the view that agricultural development is of great importance to this country?—Immense importance.

3241. Are not those low agricultural rates a very powerful stimulus to agricultural development?—That is what we feel. I think we fully recognise that the principle should apply for a certain period after building a railway into a new agricultural centre. I think we should be in entire approval of the system of cheap railway rates until that centre was sufficiently developed to pay its equal share of taxation, but what we find is that it is the almost universal rule that many of these railways have been built in centres and districts which were by no means ready for an expensive railway, and after the railways have been built no steps have been taken to develop the country by means of irrigation or water conservation, or immigration, in order that the district might warrant the railway which has been built there—the railway having been built, possibly, to satisfy certain political interests.

3242. And not in the interests of genuine agricultural development?—No.

3243. Your general view is that Johannesburg, or the competitive area, pays too large a proportion of the total railway revenue, and of the total revenue of the Government—is that so?—Yes.

3244. Now, can you give any accurate figures as to what proportion you do pay? Has any statistical authority connected with the Chamber of Commerce ever worked out the actual figures in support of that general statement?—For the railways alone, we can do so.

3245. And for the other revenue?—We cannot.

3246. A statement has been prepared, which has no pretence to authority, which attempts to arrive at the basis of that, and I should be glad if the Chamber of Commerce of Johannesburg would look into that and prepare a counter statement if possible. It appears to be very necessary to arrive at some accurate idea of what your contribution is. It has been compiled from the best sources available, but the conclusion is doubtful, because the calculation is obviously one of considerable difficulty, and the Commission would like to have your views on the matter?—**(Mr. Soutter.)** We will endeavour to comply.

3247. As a matter of fact, goods to and from Delagoa Bay proceed by what route?—**(Mr. Chappell.)** They proceed by the Witbank route—the direct line.

3248. Not through Pretoria?—No.

3249. That route is used almost exclusively?—I think both routes would be used, but the shorter one is used the more.

3250. To what extent do the superior harbour facilities of Durban counteract the difference in distance?—**(Mr. Robinson.)** The charges for forwarding and landing?

3251. Both the charges and the facilities and the difference in cost of freight?—There is no doubt that the facilities in Durban are so much better than they are to-day in Delagoa Bay that merchants who have important deliveries and quick deliveries necessarily frequently ship *viâ* Durban in preference to the other port, because they feel they will get quicker attention That is one point which very often outweighs the small difference in the railage. The landing and forwarding charges at Durban are very much the same at Delagoa Bay, and the sea freight between Durban and Delagoa Bay, I think, is approximately the same. There may be half-a-crown difference in the conference lines as against Delagoa Bay and in favour of Durban, but many lines which are not considered to be conference lines charge the same freight to either port. The Deutsche Ost Afrika Line, for instance, charge the same to both ports.

3252. Does that line run from English ports?—They formerly used to call at Dover, I think, but I do not think they do any more. But they have sailings west and east—both routes—and the freights are the same.

3253. As you may be aware, very large expenditure has been incurred at Durban in creating the harbour, and further heavy expenditure is contemplated. But if the principal customer of Durban, namely Johannesburg, is anxious to use Delagoa Bay as her port, rather than Durban, that becomes rather a serious consideration, does it not?—Yes, it would, if we felt that the whole country's future prosperity depended on the Witwatersrand, but we do not. Use the revenue they are getting from this centre to develop the rest of the country, and then Durban, East London, and Port Elizabeth will not be able to handle the traffic which this country will be able to produce in the

* The Chamber of Commerce subsequently submitted copies of memoranda addressed to the Minister of Railways on 16th February 1912, and 1st February 1913. These memoranda are not printed here.

future. In our opinion to-day, if the coal traffic, the export traffic in coal through Delagoa Bay is going to be anything on the lines it has been at Durban, there will be a congestion of traffic on both those railways. And what will be the position when the country reaches that state of prosperity and agricultural development when we become large exporters of cereals and meat. The railways and harbours as at present constituted will barely be able to handle the traffic.

3254. Yes, but in view of the very large expenditure contemplated at Durban for harbour extension, a strong feeling here in favour of Delagoa Bay as opposed to Durban would be a serious consideration?—I think we should be wrong in letting you think there was a very strong feeling here in favour of Delagoa Bay; what we feel has been that without our being consulted it has been taken out of our hands to make use of our best and most favourable geographical position. Heavy goods, of course, practically all come *viâ* Delagoa Bay.

3255. In five years' time, when that Convention comes to an end, and the South African Government resumes its liberty of action, what is your suggestion as to the best arrangement?—I think there will probably have to be some fixed arrangement made in regard to Delagoa Bay. Speaking personally—I cannot speak on behalf of the Chamber—I should like to see practically an open railway rate market, open competition. I should like, in this respect, to put before you another possibility. Say in three, five, or ten years' time, if through force of circumstances Delagoa Bay belonged to the Union, should we have Durban grasping at the throat of Delagoa Bay, as Durban has in the past fought against East London and East London against Port Elizabeth? That is what we have to consider, I submit. Because Delagoa Bay happens, unfortunately, to belong to a foreign nation, which has spent probably proportionately as much money in developing their port as Durban has hers, is she to be debarred from doing her proper share of this country's trade? But supposing it became the property of the Union to-morrow, should we not be entitled to make use of it as our geographical port?

3256. Your view in short is that having to divide your traffic compulsorily between five ports is a serious burden upon your commerce, is that so?—Undoubtedly. **(Mr. Chappell.)** Our whole point is that the excessive taxation that we have to bear in this respect is a serious burden upon our commerce and a hindrance to the development of this area.

3257. Now, can you tell us something very briefly as to the growth of Johannesburg as a distributing centre? Johannesburg is primarily a mining centre, but I think we have heard on various occasions that it is increasingly important as a distributing centre; can you tell us anything in regard to its position and prospects in that regard?—**(Mr. Chappell.)** Yes. We could not prepare any figures at the moment, but we can have them prepared, if you so desire, and they will of interest to the Commission. You will find that Johannesburg's position in that respect has been steadily growing stronger for years past, and it shows every tendency to further growth. We can give you the figure, I think, for the railage of goods away from Johannesburg, which would show you the force of the views we put forward. It has become a characteristic of recent years that it is the largest distributing centre in the Union; there is no doubt.

3258. So that in the event, which we hope is improbable, of mining diminishing here, its importance as a distributing centre may fill the vacuum?—Yes. And it has become a distributing centre not because of the assistance of the Government, but in spite of it. The sheer fact that it is the largest consuming centre in the Union has shown that it is the best place to market the produce of the Union, and it is becoming more and more the principal distributing centre of the Union.

3259. Having the largest market it is the most convenient depôt?—Yes, that is the fundamental reason, and it has been assisted, I may tell you, by a system of what we call distribution rates, which have come into force in recent years.

3260. What is the reply of the South African Railways to observations similar to those you have addressed to us this morning?—**(Mr. Robinson.)** We have had some difficulty in getting any reply.

3261. There is no definite line of argument?—No.

3262-3. You have naturally put these views before the Railway Administration and the Government?—Invariably; not once, but many times, and we have had the satisfaction of seeing the General Manager more or less support our statements in his own annual report, where he has confirmed more than once our contention that the burden falls upon the dweller in the inland centre of the Union.

LIST OF APPENDICES.

(C) Railways, Harbours, and Coal for Bunkering and Shipment.

APPENDIX I.

Newcastle, Monday, March 23rd, 1914.

EVIDENCE taken by a COMMITTEE of the COMMISSION consisting of Sir H. RIDER HAGGARD, Mr. T. GARNETT, and the Hon. E. R. BOWRING.

Mr. WILLIAM BEKENN, Manager of the Fairleigh Colliery, examined.

(*For Evidence of this Witness as to Coal Mining*, see *p.* 105 *of* [*Cd.* 7707.]).

(Sir Rider Haggard.) Do you know how the output of the Natal collieries could be increased?—We are so far away from the distributing centres. All our coal goes practically to Durban. We are 260 miles from the coast, and it is only by sympathetic treatment by the Government in the matter of railage that we are able to increase the output. At the present time Natal is not treated fairly. The differentiation of rates between the Transvaal and Natal are so large that we are handicapped, *i.e.*, the rates for bunkers from Transvaal to Cape Town is ·16 of a penny per ton per mile, whilst the bunker rate from Natal mines to Durban is at the rate of ·33 of a penny per ton per mile. It is bunkered at from 15*s.* 3*d.* to 16*s.* 6*d.* per ton. There will have to be a reduction of something like 2*s.* 6*d.* per ton on Natal coal to enable us to compete with other countries and capture the Indian and Eastern market.

(*a*) This traffic was not shown separately in 1912.

APPENDIX III.

MEMORANDUM (extracts) furnished to the COMMISSION by Mr. J. T. WILLIAMS, MANAGING DIRECTOR OF THE NATAL NAVIGATION COLLIERIES AND ESTATE CO., LTD., on Coal Bunkering at Durban, the Natal Coal Export Trade, and Railway Rates on Natal Coal.

(*For the evidence of Mr. Williams*, see *p.* 125.)

The following statement shows the output of coal in Natal during each of the last four years:—

	Tons of 2,240 lbs.
1910	2,296,687
1911	2,394,238
1912	2,472,085
1913	2,608,408

The total for the four years is distributed as follows:—

	Per cent.
Shipped as bunker coal at Durban	49
Exported as cargo	19
Natal railways and harbours	14
Inland or local customers other than railways and harbours	18
	100

A detailed analysis of the 1913 export trade of the Natal collieries gives the following figures:—

Exported to:—

	Tons.
Bombay, Karachi, Colombo	263,529
Singapore and other neighbouring Ports	33,380
Port Louis, Zanzibar, Beira, Madagascar, and other East Coast Ports	16,320
West Coast Africa	2,751
	315,980

The existing collieries can increase their production probably as much as 50 per cent., given reliable and sufficient supply of railway trucks and an adequate and suitable supply of coloured labour. The present carrying capacity of the railway is able to carry a much larger output, but being a single track line, accidents often disorganise working arrangements.

Expansion mainly depends on the increase of coal shipped as cargo for consumption elsewhere, but increases may also be brought by other causes such as :—

(*a*) Lower railway rates:

(*b*) Increased bunkering trade.

(1) *At Durban.*—It will be seen from the table analysing distribution of output that the bunkering trade itself is already considerable.

Much of this has been due to increased shipping required to deal with the expanding trade of the Colony and South Africa, and partly to the increased quantity taken by steamers, especially those engaged in the trade between Australia and Europe. Many large steamers have been built within recent times for this trade.

It may be presumed that under normal conditions this trade will continue to increase (with a decreasing percentage of annual increase). The increase has been continuous, notwithstanding the decrease from time to time in the Suez Canal dues.

(2) *At Cape Town.*—This again depends upon the expansion mainly of the Australian trade, also on the price of coal at Las Palmas and Madeira. Obviously, the oftener bunkers can be replenished the greater the tonnage of pay cargo that can be carried. Steamers on the long voyage between East and West can, therefore, increase their earnings if good coal at a suitable price be available at Cape Town. It may be presumed that Natal coal owners will in their own interests watch markets so as to secure as much as possible of the Cape Town trade. At Cape Town, Natal coal is to some extent in competition with Transvaal coal, owing, we think, to the unduly low rates overland from Transvaal collieries. They have also the competition of coal imported from the United Kingdom and of coal shipped to Las Palmas and Madeira. The price trimmed into bunkers at Cape Town will, therefore, depend on freight, which in 1914, and especially in 1913, has been higher than previously.

This matter will be more fully referred to when dealing with the question of railway rates.

The following figures show the extent import of coal from the United Kingdom has decreased at Cape Town since the development of bunkering of Natal coal at that port set in :—

1911	-	-	51,500 tons (of 2,240 lbs.).
1912	-	-	45,700 ,, ,, ,,
1913	-	-	28,600 ,, ,, ,,

3. *Export of Natal Coal to Cape Colony generally (Bunkers and Local Trade).*—One or more of the Natal collieries, at different times, succeeded in making contracts with the old Cape Government Railways for coal for locomotive use. It was railed to Durban and thence shipped to East London, Port Elizabeth, and Cape Town respectively, but the business ceased after 1912 owing to the Union Railways Administration being suited with exceedingly low-priced contracts with Transvaal collieries. The new trade in sending coal to Cape Town for bunkering came as a set-off. The annual exports for this and other trade have been as follows :—

1911	-	-	-	-	270,314 tons.
1912	-	-	-	-	402,967 ,,
1913	-	-	-	-	299,570 ,,

This business has been made possible by the co-operation of the Government on the one hand and of the collieries on the other. Not long ago charges at Cape Town for removing coal from the carrying ship to the bunkers of the buying ship were excessive. To promote the trade the Government fixed a uniform charge of 2*s.* to cover all charges incidental to removing coal, trimmed, into the bunkers of the buying steamer. In 1914, this charge has been increased to 2*s.* 6*d.* night work and Sundays, other days 2*s.* as before; 3*s.* coaling in roadstead. It is not convenient or economical for any one Natal colliery to make its own arrangements independently of other Natal collieries for exporting coal to Cape Town, owing to difficulties incidental to chartering and loading steamers. The majority of the companies have, therefore, found it necessary to combine so as to supply large quantities to a buyer undertaking the risks of sea transport and sales at Cape Town. The collieries sell at a price net, free at ship, Durban, leaving it to the buyer to make the selling price at Cape Town. Under this arrangement a minimum quantity has to be bought firm for delivery in equal monthly quantities over one year. This has necessarily carried the right to the buyer to restrict the sellers from competing against him at destination through other agents. A good deal of unjustifiable opposition to this arrangement has manifested itself at Cape Town. Dissatisfaction has arisen among some of the selling agents at Cape Town. It may be well, therefore, to enlarge on the position. It is common knowledge that the larger collieries sell coal through their own accredited agents; whether sales be in the United Kingdom, in Cape Town, or elsewhere, an agent is usually restricted from selling the coal of another colliery. Under this practice no one can buy, say, Durban Navigation coal in the United Kingdom or Dundee Company's coal or Natal Navigation, except through the respective agents of those collieries. It would be unreasonable if other coal agents in the United Kingdom complained, say, to the Board of Trade, that they were not able to buy in the United Kingdom the above coals, except by buying direct from the company's agents, yet this is what is done by certain coal merchants at the Cape. They make it a grievance that they are not able to buy direct from the collieries, though the more important collieries and others have their own agents at all the ports.

In 1913, a number of companies co-operating made a contract with the Union-Castle Company, which was advantageous to the collieries and to the freighters, and at the same time did not place the consumer at a disadvantage. The co-operating companies made it a condition that the Union-Castle had to buy a minimum of 326,000 tons of varying quantities from each colliery at prices varying from 13*s.* 6*d.* to 15*s.* net, free at ship, Durban. The Union-Castle Company would require less than one half of this quantity for their own steamers and the balance would have to be exported for sale at Cape ports, otherwise they would not be able to secure the quantity required for their own bunkers. The Union-Castle Company were obliged to buy the large additional quantity for export as a condition of the contract; in return they imposed upon the collieries the condition that the collieries should not compete against them at Cape ports by sending consignments of their own direct. The collieries did not attempt to prevent the Union-Castle from shipping other coals to Cape ports if required. As a matter of fact, large quantities of other coals were actually shipped. The Union-Castle were free to fix their own rate of freight, and to fix the selling price at Cape Town, and this they would be bound to fix at a price that would enable them to dispose of the surplus bought over their bunker requirements. Apparently the rate of freight included was not more than would have to be paid to any other freighter. The grievances complained of apparently were :—

(1) That the coal agents at Cape Town could not obtain coal direct from the collieries, and that they had to buy from the respective agents of the collieries or not at all.

(2) That the arrangement by which coal was sold in large quantities to one buyer for export to the Cape had increased the price of coal at Cape Town.

The increase in the price has been brought about by other circumstances. In 1910, 1911, and 1912 all Natal collieries were in free competition, with the

result that in 1912 prices had reached their lowest limit, and more than one company had to make temporary arrangements to tide over financial stringency. The highest price in 1910 was 14*s.* 6*d.* for bunker coal, net, f.a.s. Durban, 14*s.* 6*d.* in 1911, and 14*s.* 9*d.* in 1912; other prices varied down to 12*s.* 6*d.*, whilst during most of this time the shipping companies were making handsome profits in South Africa and throughout the world. In 1913, in order to promote the export trade and to improve financial results, a number of companies decided to co-operate and thereby succeeded in raising prices. The prices for this group ranged in 1913 from 15*s.* 3*d.* to 16*s.* 6*d.* per long ton, net, f.a.s. Durban, and in 1914 from 15*s.* 3*d.* to 17*s.*, all subject to reduction for quantity. This increase, added to the phenomenal rise in freights in 1912 and 1913, brought about an increase in Cape Town which would have happened whether the business had been done through the Union-Castle Company or through any other buyer.

Increased Exports.

The exports to Cape Town are dealt with in a previous heading. It is to this and to an increase in the general export trade that the Natal coal industry looks for the greatest expansion in trade. The markets most easily accessible are:—

		Competitors.
East Coast	Zanzibar, Chinde, Mombasa, Aden	Transvaal and Welsh.
India	Karachi, Bombay, Marmugoa	Indian, Transvaal, Welsh, Japanese.
Ceylon	Colombo and requirements, Ceylon Government Railways	Do.
Mauritius		Transvaal, Welsh.
Madagascar		Do.
Straits Settlements.		Australian, Indian, Japanese, Transvaal.
Dutch East Indies.		Do.
South America.	Buenos Ayres, Rio de Janeiro, &c., &c.	United Kingdom.

The following figures give some idea of the business done at some of the above places:—

Export of Coal from the United Kingdom.—For month of January in each year:—

	January 1912.	January 1913.	January 1914.
Portugal, Azores, Madeira	109,200	142,600	130,800
Madeira not separately stated.			
Spain, Canaries	396,500	361,500	345,600
Las Palmas not separately stated.			
Brazil	131,800	139,900	118,500
Argentine Republic	279,900	319,900	354,800
*Aden and Dependencies	25,600	11,200	12,100
*British India	3,600	4,800	1,800
*Ceylon	14,200	24,400	38,500

According to Union statistics Cape Town imported from the United Kingdom:—

	Tons.
1911	51,500
1912	45,700
1913	28,600

* Imports also from other countries (India, Japan, and Australia).

India uses a large quantity of coal other than produced by Indian collieries. The imports are supplied by Australia, Japan, United Kingdom, and Natal. A large trade has been by Natal collieries with Bombay, Karachi, and Ceylon. The shipments to India, including Ceylon, in 1913 amounted to 263,529 tons. The railway contract with Ceylon Railways was secured by two Natal collieries for 60,000 tons a few years ago. A contract with the Railways has also been secured for 1914 to the extent of 30,000 tons.

The total quantity of coal imported into Bombay by sea from all sources varies annually, but it may be taken at from 1 million to 1½ millions, most of which comes from Calcutta, the balance being supplied by Europe, 120,000 to 150,000; Australia, 100,000; and a small quantity from Japan.

The figures given below are taken from a Bombay market report to illustrate comparative prices per ton of Cardiff, Bengal (Desharghur), and Natal coal at that port during the last three years:—

	Bengal.	Cardiff.	Natal.
	£ *s. d.*	£ *s. d.*	£ *s. d.*
1907	1 0 11	1 8 11	—
1908	1 0 10	1 8 0½	1 2 2⅔
1909	17 11	1 3 6	1 0 6⅙

Prices for coal at Bombay, 1913.

The following is an extract of coal prices at Bombay in September last (1913) September 6th:—

	Rupees.
Powell Duffryn *Cardiff*	23½
Davidson's *West Hartley*	21½
Desharghur *Bengal*	18½
Kawrie's *Desharghur*	17½
Heilger's *Standard*	16½
Hraham's *Natal*	18½
Transvaal *Witbank*	19
Desharghur Equitable	18⅓

Recent Freight Quotations:—

Cardiff to Bombay, 6,600 tons, 13*s.* 10½*d.*, 1913.
" Las Palmas, February 1914, 6*s.* 6*d.*
" Colombo, June 1913, 12*s.* 6*d.*
" " February 1914, 8*s.* 6*d.*, 5,000 tons.

Instances of freights paid on shipments of coal from Durban:—

1910. Singapore, 6*s.*, 6*s.* 1½*d.*, 6*s.* 4½*d.* (free to ship).
1911. Penang, 5*s.* (free to ship).
Colombo, 5*s.* 6*d.*, less 2 per cent. (free to ship).
1912. Singapore, 7*s.* 6*d.* (free to ship).
1913. Penang, 9*s.* (free to ship).
Singapore, 8*s.* 9*d.* (free to ship).
Tuticorin, 8*s.* 6*d.* " "
Bombay, 7*s.* 6*d.*, 7*s.* 3*d.* (free to ship).

East Coast.—Zanzibar, lowest freight for small lots about 12*s.* 6*d.*

Bombay and Karachi together import about two million tons annually of sea-borne.

Conditions under which the Coal is conveyed from the Mines to the Coast, and the Possibility of Improving these Conditions.

Present Conditions.—The coal is mostly conveyed to the coast in wagons of 30 to 35 tons carrying capacity. Ladysmith is an important railway centre in Northern Natal, some 60 to 80 miles from most of the colliery stations. Here trains of coal are made up, and, according to present arrangements, I understand that twelve fast trains are scheduled for despatch from that station daily. They are timed to take from 23 hours to 26 hours to get through to South Coast Junction and other storage sidings, making the time from Glencoe Junction (north of Ladysmith), the distributing centre nearest the Mines, from about 27 to

30 hours. These trains carry most of the tonnage, the remaining proportion being dealt with by the ordinary goods and coal general service, taking, I believe, *under the most favourable conditions*, from 30 to 40 hours.

It would be a great boon to the industry if these trains always worked according to the time-table. Unfortunately, owing to the nature of the railway being almost throughout a single line, mishaps, which are pretty frequent, interfere seriously with the due running of trains, and the coal often takes a considerably longer time to come to the port. The working of the traffic is subject to all the inconveniences and difficulties incidental to single-line working.

To avoid the breaking up of loads of trains, banking or assisting engines are provided to run over certain sections where the grade is most severe. Under this arrangement, train loads are now only reduced or increased at Ladysmith, Maritzburg, or Cato Ridge, and at no part of the journey is the load less than 650 tons.

The size of locomotives and the tractive power are steadily increasing. The heaviest type can convey 1,000 tons, gross load, into Ladysmith, and with the gradual introduction of higher tractive power south of Ladysmith there would be a corresponding increase in the acceleration of transit.

By continuous expenditure in recent years in increasing the radii of curves and improving gradients by increasing the tractive power of locomotives, the capacity of the railway has increased very considerably. Extensive improvements as to the main line are still in progress, the cost of which will run into high figures. When complete, the line will be capable of carrying a much larger tonnage.

A very decided conflict of opinions has manifested itself between the leading men and associations in Natal, on the one hand, and the Government, on the other, as to the railway policy in Natal. The Government have committed themselves to an enormous expenditure on improving the present main line, and as a result it will increase the total distance but with greatly increased carrying capacity. All the grades of one in thirty, which have for years handicapped the service, will be abolished, and a minimum of one in fifty or better established. Durban and other interests, including influential public men, have for years advocated building a new line, shorter by some fifty miles than the improved main line, and having satisfactory grades between Durban and the coal districts. This, it is contended, will not only accelerate the service, but considerably cheapen the cost and bring rates down. The Government, however, have finally decided to continue their policy of spending large sums on improving the main line. Such a matter as this seems to be one that could be more suitably dealt with by a railway board having independent jurisdiction.

On arrival in the neighbourhood of Durban, the trucks are placed in storage sidings until required, either at the Bluff wharf, or at the Point, wherever the steamer may be.

Bunker coal for steamers trading with the port is mostly shipped by hand at the Point side, and steamers calling for coal only and taking coal cargoes are coaled at the Bluff (on the opposite side) by mechanical loading appliances. On the Point side, the trucks are shunted to the wharf alongside the vessels, and the coal conveyed on board by coloured labour in baskets in the way usual at most ports. Lighters alongside are also sometimes used. The minimum rate of loading with the Bluff appliances exceeds some 4,000 tons a day of 24 hours.

Railway improvements required include—

(1) Improvement in the grades of the railway and increase of size of curves—both now proceeding.

(2) Further increase in tractive power of locomotives.

(3) Increase in number of locomotives and trucks available for traffic.

(4) Increased bin accommodation, as well as the provision of means to make bin (10,000 tons capacity) now at Bluff more useful to release trucks.

Additions to the Bluff coaling appliances were sanctioned in 1913, and the tender of Messrs. Fraser and Chalmers accepted. The new appliances will include a dumper capable of lifting a truck of 50 tons capacity with an over-all length of 50 feet. A belt conveyor will also form part of the equipment. The plant will arrive shortly in the Colony. The expenditure on this work, some 70,000*l.*, was sanctioned early in 1912.

(5) In the future, and we hope the near future, the necessity for doubling the main line or the building of a new double line by a shorter route will become an important and urgent question. By its geographical position and its mineral and agricultural resources, Durban ought to become the chief port of the Union, and will, no doubt, become the chief port whenever improvements possible are provided. Moreover, it is the Union port nearest to the great industrial centre of the Transvaal.

The railway disabilities are domestic questions, but they have an important influence on output. The losses and difficulties incidental to an insufficient and irregular supply of railway trucks and locomotives have recurred from time to time for years, notwithstanding that the Administration is constantly increasing the supply. The supply is often insufficient or not evenly distributed over the working day, but collieries have to provide a staff adequate for a full supply.

The want of adequate storage capacity other than in trucks so as to release the trucks for service to provide a reserve of coal to meet certain demands has been an urgent necessity for years.

Port Charges on the Shipment of Coal.

The port charges on coal are (per ton of 2,240 lbs.):—

For loading, trimmed into bunkers:—	*s.*	*d.*
At Bluff by appliances, export coal	0	7½
At Bluff by appliances, bunker coal	1	0
At Point by hand (in baskets) bunker:—		
Day service	1	3
Night service	2	6
Combined day and/or night service	1	9

Steamers calling solely for export and bunker coal are allowed a rebate of 50 per cent. in harbour dues, or at option may pay 6*d.* per ton up to 1,000 tons and 3*d.* per ton over 1,000 tons of coal taken.

Other port charges are:—

Harbour dues, inclusive of pilotage:—	*d.*
For each registered ton net to 400 tons	9
Over 400 tons and up to 1,500 tons	7
Over 1,500 tons and up to 2,000 tons	4
Over 2,000 tons	2

Light dues are 2*d.* for the first 500 tons and 1*d.* for the balance over 500 tons net register.

No light dues are charged on steamers calling for coal only.

Railway Rates for Coal.

Annexure A. gives a complete list of the rates for coal for shipment from Transvaal collieries to the port of Lourenço Marques and from Natal collieries to Durban.

Annexure B. is a list of rates for coal for inland consumption, worked out per ton per mile for specified distances. Lourenço Marques, Durban, and Cape Town are competitive ports for shipment of coal. Transvaal ship coal *viâ* Lourenço Marques for bunkers as well as for export, and despatch coal to some extent overland for ships' bunkers at Cape Town. All Natal coal taken by steamers in South Africa is sent *viâ* Durban; hardly any is sent overland.

Annexure C. shows the rates for coal from all collieries in the Union to Cape Town, with which Natal is very dissatisfied. Representations have been made to Government by coalowners, Chamber of Commerce,

and the Durban Corporation on the inequality of railway rates, but no relief as yet has been given.

We consider that the rates give an undue advantage to the Transvaal collieries sending coal overland as compared with the combined rail and sea routes *viâ* Durban.

Witbank is the principal coal-sending station in the Transvaal; Hatting Spruit in Natal.

Facilities offered by Durban and Cape Town as Bunkering Ports.

The greatest facility is the cheapness of coal at Durban compared with Cape Town, and the quickness with which coal can be loaded. Even when freights are lowest coal can be sold cheaper in Durban than in Cape Town, trimmed into bunkers, by 6*s.* or 7*s.* a ton.

The lowest price paid by the Natal collieries to the Union-Castle for carrying large quantities of coal to Cape Town was 5*s.* 3*d.* in 1910, when freights were exceptionally low. Freights paid them since have been—

1911 - - -	6*s.*
1912 - - -	6*s.*
1913 - - -	8*s.*
1914 - - -	7*s.*

The cost of putting on board at Durban ex truck is 1*s.* 3*d.* by hand on the Point side, or 1*s.* per ton, day work, on the Bluff side (bunkers). For export coal 7⅛*d.* per ton. Coal bunkered in Durban is much less handled than Natal coal shipped to Cape Town and bunkered at that port.

The following is a comparison of the prices of the same coal for bunkers at Durban and Cape Town respectively :—

	Durban.	Cape Town.
Class "A" coals	From 16*s.* to 17*s.* plus, say, 1*s.* 3*d.* loading.	From 25*s.* to 26*s.*, trimmed into bunkers.
Class "B" coals	15*s.* to 16*s.* plus, say, 1*s.* 3*d.* loading.	24*s.* 6*d.* to 25*s.* 6*d.*, trimmed into bunkers.
Class "C" coals	14*s.* 3*d.* to 15*s.* 3*d.* plus, say, 1*s.* 3*d.* loading.	23*s.* 6*d.* to 24*s.* 6*d.* trimmed into bunkers.

There is also at Durban a much larger supply of coal available.

Durban, therefore, offers a distinct economy over Cape Town, especially when freights Durban to Cape Town are high, thereby increasing the cost of Natal coal at latter port.

At the present time the difference in favour of Durban is about 8*s.* a ton, or 1,400*l.* for a large steamer like the "Ulysses," taking 3,500 tons bunker coal. Even with substantially reduced freights to Cape Town, the saving would be 6*s.* per ton or over 1,000*l.* for the bunkering of the same ship.

Annexure A.

EXPORT AND BUNKER COAL IN TRUCK LOADS.

The rates are :—

(A) *From Transvaal Collieries to Lourenço Marques.*

Mileage to Lourenço Marques.	Station.	Colliery.	Rate per 2,000 lbs. to Lourenço Marques.

8th September 1913.

APPENDIX IV.

Statement furnished to the Commission by Mr. Herbert Warington Smyth, M.A., Secretary for Mines, for whose Evidence *see* p. 1-8 of [Cd. 7707].

South African Coal Bunkering and Export Trade.

Output.—The total output for South Africa during 1912 was 8,117,000 tons, valued at 1,999,000*l.* To this output the Provinces of the Union contributed as follows:—

	Tons.	Total Value.	Value per Ton.		
		£	*s.*	*d.*
Transvaal - -	4,751,850	1,044,986	4	4·78
Natal - - -	2,765,068	771,755	5	6·99
Orange Free State	525,459	141,380	5	4·57
Cape - - -	74,701	41,257	11	0·55

The Transvaal produced 2,960 tons of coke, value 3,469*l.* Natal produced 5,000 tons of coke, value 8,511*l.* The Transvaal companies produced 25,895 gallons of tar, value 806*l.*

The Transvaal Coalfields.—To the above output in the Transvaal the Middelburg and Witbank coal area contributed 76 per cent., and the Springs-Brakpan area 13 per cent. The former coalfield is that which is best situated for an export trade, and it is in direct communication by rail with the port of Lourenço Marques, distant 276 miles from Witbank. The run to the coast is chiefly downhill, with the exception of a climb of 1,100 feet from Witbank to Belfast (altitude 6,463 feet).

The Springs-Brakpan area, which contributes about 13 per cent. of the Transvaal output, finds its market mostly on the Witwatersrand goldfields.

The Natal Coalfields.—In Natal 84 per cent. of the total coal production comes from the Dundee area in the Klip River county, where the coalfield extends for a distance of some 70 miles and lies athwart the main line.

The Railway Communication to the Coast.—The coalfield is served by a single line to the port of Durban, distant 239 miles. The run to the coast is a heavy one for such a class of traffic. Hattingspruit, which may be taken for convenience as the centre of the coal district, is at an altitude of 4,298 feet. The line drops from this altitude to 3,156 feet at Colenso, and then rises over mountain country to an altitude of 5,035 feet at Dell, rising and falling to Nottingham Road 4,807 feet, and thence downwards to Maritzburg 2,218 feet, which is 71 miles from Durban. From an altitude of 2,099 feet after leaving Maritzburg the line rises to 3,006 feet at Thornhill Junction, and then with some variations falls steadily towards Durban to sea-level.

The difficulty of getting the coal from the Natal coalfields to the coast is under the present circumstances a considerable one. There has in the past been inevitably a serious congestion on the main line, and this fact, coupled with the want of rolling-stock and the absence of good bin accommodation, has frequently necessitated restricting output at the collieries.

The suggested Alternative Route.—The Natal main line is famed for the mountainous character of the country which it crosses, for the very steep gradients and short radius curves necessary to overcome the obstacles on the present main line route, and these have given rise to a loud demand from persons interested in the coal trade for an alternative route to the coast.

It is argued by supporters of this route that costly deviations and increase in the number of sidings will never make the present main line satisfactory, and that even a considerable increase in the actual amount of rolling-stock available for the trade will not clear the line of the congestion which has existed in the past, even with the aid of additional sidings.

The route proposed is by way of the Tugela Valley, which would take the line to the north coast railway without any serious altitude having to be negotiated, and the course would then follow the present coast line into Durban, with the result that the distance would be shortened, haulage costs per mile would be considerably reduced, and the congestion which has always existed on the main line would be entirely avoided, while a wholly new district with considerable possibilities both from a mining and agricultural point of view would be opened up.

Running Time.—The average time taken by trucks at present to the coast is understood to be between three and four days from the Dundee area. The amount of standing time for these trucks must be very high, as on arrival at the quayside they are again detained standing with coal until the mineral is required to be placed on board ship.

The objection to a large increase in the present bin accommodation at the collieries or at the port is the breakage caused to the coal in double handling. There is no doubt that Natal coal is peculiarly friable and suffers a great deal in this respect if constantly handled and tipped into bins at both ends of the journey.

Bunkering and Export Tonnages.—The total amount of coal disposed of for bunkering and export during the last three years is as follows:—

	Bunkering.		Cargo.	
	Tons.	Value.	Tons.	Value.
		£		£
1911	1,426,586	1,027,731	82,536	51,276
1912	1,413,222	1,067,663	166,992	106,157

	Bunkering and Cargo.	
	Tons.	Value.
		£
1913	2,307,782	1,389,698

Countries of Export.—In 1912 India and Ceylon took 58 per cent. of this export, as against 18 per cent. for 1911: East African ports and Egypt took 24 per cent., as against 29 per cent. for 1911: Straits Settlements and Dutch East Indies took 4 per cent., as against 32 per cent. for 1911. Details for 1913 are not yet completed.

Prices at Durban.—Regarding prices at which coal is sold f.a.s. Durban, the following figures representing one large colliery in Natal for bunkering contracts will be of interest:—

1907 - - -	17*s.*	per long ton.
1908 - - -	18*s.*	,,
1909 - - -	16*s.*	,,
1910 - - -	14*s.* 6*d.*	,,
1911 - - -	14*s.* 6*d.*	,,
1912 - - -	14*s.* 9*d.*	,,
1913 - - -	16*s.* 6*d.*	,,
1914 - - -	17*s.*	,,

The above are all subject to rebate from 3*d.* to 9*d.* per ton according to the quantity taken and are for bunkering coal under contract for one year.

The figures for the years 1910–12 inclusive cover the period of most serious competition in the Natal trade, which ended by the formation of an association of Natal collieries.

The Natal Coalowners Combine.—This Association was formed and is renewed from year to year with a view to regulating the selling price of coal and it controls the following collieries in Natal: Ballengeich, Burnside, Elandslaagte, Glencoe, Natal Navigation, Natal Cambrian, Natal Steam Coal Company, Newcastle, St. George's, South African, the total output for these collieries being over 150,000 tons per month. Five collieries were prevented from joining such a combination on account of two, Hattingspruit and the Durban Navigation, being owned by the Union-Castle Co., two others, the Hlobane and Utrecht, having clauses in their agreements with the Railway Administration preventing them from joining combinations, and the fifth, the Ramsey, supplying coal to the Free State. The total output of these five is about 74,000 tons a month.

Causes of Increase of Price.—The price for coal went up in 1913 all over the world, so that the increase for this year in Natal prices was probably not entirely due to the formation of the Association. The price for coal in other parts of the world is being maintained in the 1914 contracts and world conditions in the coal trade will probably justify even higher prices than those quoted for the present year for Natal coal.

Effects of Competition.—The prices quoted during 1910 to 1912 (14*s.* 6*d.*, 14*s.* 9*d.*, f.a.s. Durban) brought most unsatisfactory financial results for the working of the Natal industry. The prices had been allowed to get too low, and few of the collieries were able to pay any dividends, while necessary capital expenditure for improvements in plant and general improvement and increased safety underground were rendered impossible to the management owing to lack of funds. The position in those years could not continue.

Questions have been raised with regard to the influence of the Union-Castle Company on the Natal Associated Collieries during the past year. As a matter of fact, however, the interests of the two parties do not appear to be identical, and the raising of the price for 1913–14 certainly cannot be laid to the charge of the Union-Castle Company, which would be glad to have lower prices if possible.

Prices at Cape Town.—The price of Natal coal at Cape Town, where a considerable amount of coal was sold for bunkering trade during 1913, was 24*s.* to 26*s.*, according to the class of coal, per long ton. The prices for 1914 are understood to be 24*s.* 6*d.* to 26*s.* per long ton. This price has risen a couple of shillings since 1912, but it may be pointed out that freights increased enormously all over the world in 1913, as compared with 1912, and this extra charge was for increased freight, pure and simple.

It would appear that in future the prices for bunker coal at the various ports of the Union will maintain roughly their present figures, with possibly slight advances, as costs of freight generally throughout the world show a tendeney to rise.

General Remarks.—Cape Town will, in the future, be supplied by sea-borne coal from Durban, and by a certain amount of Transvaal coal from the Witbank district, which, however, will not probably be able to be carried the necessary 1,000 miles of railway at any rate which will enable the price at Cape Town to be reduced.

For the bunkering trade generally it would appear that Durban, by its considerable wharfage area and the loading conveniences at that port, by its proximity to the Natal coalfields, producing the best steaming coal in South Africa, and by its geographical position, will remain the centre of the bunkering trade for the majority of ships. The Cape Town trade will depend largely on passenger vessels going direct to Australia and New Zealand, while the Natal bunkering trade will be more widely distributed.

The port of Delagoa Bay is however, better situated for the export trade to the East Coast, India, and the East Indies, and its position will probably enable the Transvaal coalfields to compete successfully with Durban in that class of trade in the future.

Figures* giving comparisons between the Transvaal, Natal, and Cape coal are attached hereto for the confidential information of your Commission.

* Not printed

APPENDIX V.

A.

Information in reference to the Ports and Harbours of South Africa.

Questions by the Royal Commission.	Cape Town.	Port Elizabeth.	East London.	Mossel Bay.	Durban.
1. Navigable depth at entrance, L.W.S.T.?	36 feet L.W.O.S.T.	Port Elizabeth is an open roadstead.	20 feet.	No dock entrance, landing and shipping by tugs and lighters. Landing jetties partly protected from heavy seas by a small breakwater. Good anchorage in the bay.	35 feet 3 inches.
2. Navigable depth and width of channel from entrance to berthing accommodation, L.W.S.T.?	This hardly applies to Table Bay Docks, as there is only the entrance, 250 feet in width, leading directly into a floating basin of 67 acres area. There is also an inner entrance of 100 feet in width and about 400 feet long, leading to the Alfred Basin, 8½ acres in extent.	The depth at the ordinary working anchorage is 6 fathoms.	Depth 24 feet, width 150 feet at entrance widening out to 500 feet opposite West Quay.	——	Width and depth of channel vary, but nowhere is there less depth than 31 feet.
3. Rise and fall of tides:— (*a*) Spring tides? (*b*) Neap tides?	The average range of Spring Tides is 4 feet 6 inches, and the average range of Neap Tides about 2 feet, as recorded on the automatic tide gauge.	(*a*) 5 feet 8 inches (*b*) 2 feet (H.W.O.N.T. is 3 feet 10 inches above L.W.O.S.T.).	(*a*) Springs, 5 feet 6 inches (*b*) Neaps, 1 foot 9 inches	(*a*) 6 feet. (*b*) 3 feet.	(*a*) 6 feet. (*b*) 3 feet 6 inches.
4. What is the maximum depth of water at piers, wharves, or docks, L.W.S.T.?	The maximum depth of water at L.W.O.S.T. is 36 feet at the East Pier.	At the Dom Pedro Jetty one berth gives least depth of water, 21 feet at L.W.O.S.T.	27 feet 9 inches.	10 feet.	38 feet 6 inches.
5. What is the length of pier, wharf, or dock side where such maximum depth of water is available? How does this length compare with the total accommodation at the port?	The length of the East Pier is 786 feet. The litho* attached will show the other berths.	300 feet. This is practically the whole, as the wharves are used for lighterage.	1,000 feet West Quay 500 feet East Quay. One quarter of total.	700 feet frontage 7/10ths.	710 feet. 5½ per cent. of total length.

* Not reproduced.

INFORMATION IN REFERENCE TO THE PORTS AND HARBOURS OF SOUTH AFRICA—*continued.*

Questions by the Royal Commission.	Cape Town.	Port Elizabeth.	East London.	Mossel Bay.	Durban.
6. What are the dimensions of the largest vesssl which can be (*a*) berthed, (*b*) repaired, under existing conditions?	(*a*) The largest vessel berthed was the White Star liner, "Ceramic," at the East Pier. Her dimensions are 675 feet in length by 68 feet beam and her draught at the time 31 feet 9 inches. (*b*) The largest vessel repaired was the "Everton Grange," of 8,096 tons, with dimensions 475 feet B.P. by 56·1 feet by 33·5 feet. She was put into dry dock and repaired after having been ashore. Also on a prior occasion the R.M. steamer "Norman," 490 feet B.P., was dry docked. The R.M.S., "Kildonan Castle" and "Kinfauns Castle" are the largest ships that the dry dock could accommodate, their dimensions being 515·3 feet B.P. by 59·2 feet by 32·4 feet, and tonnage 9,664.	(*a*) 300 feet. (*b*) There is no dry dock at Port Elizabeth and there are few facilities for repairs of any magnitude.	(*a*) s.s. "Monarch," 475 feet long; s.s. "Galway Castle," 8,010 tons gross register. (*b*) Patent slip accommodates up to 1,000 dead weight; cradle, 200 feet long.	(*a*) None. (*b*) Tugs, whaling and fishing trawlers.	(*a*) 1,000 feet long, 32 feet draught. (*b*) 8,000 tons dead weight.
7. How much capital expenditure has been incurred hitherto on the port?	3,926,114*l.*	To end of July 1913, 1,477,537*l.*	Approximately 2,090,000*l.*	Total to 31 March 1913, 139,762*l.* 18*s.* 11*d.*	£4,100,593. 31 March. 1912.
8. What are the present charges— (*a*) for interest on capital, (*b*) for maintenance, (*c*) for improvements (paid from Revenue)?	(*a*) 3½ per cent. on a fixed figure of 3,460,227*l.* at Union, plus net capital expenditure since Union, so that it is a fluctuating figure monthly. On the basis of the interest chargeable for July, the total amount for a year would be 124,174*l.* 7*s.* (*b*) *Expenditure for year ended August*, 1913:—	(*a*) Average for 12 months, 47,580*l.* (*b*) Average for 12 months, 62,544*l.* (*c*) Included in maintenance.	About 4,500*l.* per month. „ 4,000*l.* „ „ „ 2,620*l.* „ „	(*a*) 3,950*l.* per annum (approximately). (*b*) 3,350*l.* per annum (approximately).	(*a*) 140,369*l.* (*b*) 160,536*l.*
9. What is the present Revenue?	*Revenue—September* 1912 *to August* 1913 (*inclusive*). 349,845*l.* 17*s.* 10*d.*	Average for 12 months, 234,120*l.*	About 170,000*l.* per annum.	For year ending 31st March 1913, 7,428*l.* 0*s.* 3*d.*	1911-12. 219,052*l.*

(*b*) *Expenditure for year ended August*, 1913:—

	£	*s.*	*d.*
Maintenance and upkeep	67,693	12	8
Traffic working -	142,881	7	5
Cartage services -	30,820	19	6
General charges -	21,628	13	11
Depreciation - -	63,120	1	3
	£326,144	14	9

10. Can the channel and depth of water at berths be deepened to 40 feet at L.W.S.T., and can accommodation be provided for vessels of 1,000 feet?	It would not be practicable to deepen the present entrance to 40 feet, though the canting basin is now being dredged to that depth. There is no accommodation for vessels of 1,000 feet in length at present, although a vessel of this length could be berthed at the South Pier if its draught did not exceed 26 feet.	If a breakwater is built there will be almost unlimited accommodation for vessels of any size.	Yes, but vessels of 1,000 feet long cannot at present be turned.	No.	The channel can be deepened to 40 feet. The 38 feet 6 inches berth can also be deepened to 40 feet, but no other berthing accommodation can. Yes, on 35 feet draught.
11. In how long?	,, ,, ,,	Probably within 5 years of the date funds are provided.	10 to 15 years.	——	Approximately 3 years
12. At what approximate cost?	,, ,, ,,	1,500,000*l.*	1,000,000*l.*	——	About 50,000*l.*
13. Would the present charges for maintenance be largely increased by deepening berth accommodation to 40 feet L.W.S.T., and by providing for vessels of 1,000 feet?	No, not greatly.	Yes, considerably. It would be impracticable to increase the depth appreciably without extending the existing wharves into deeper water.	Yes.	Cannot say, as there exist no outer works for the formation of an inner harbour or dock.	No.
14. To what extent are foreshores such as would render an echelon arrangement of wharves practicable?	Our foreshores are unsuitable for the arrangement mentioned.	Under present conditions this would not be practicable.	Not adaptable.	There is ample foreshore for wharves should extensive harbour protection be carried out.	60 per cent. of harbour foreshore is suitable.
15. Observations: Kindly state further essential particulars necessary to show the existing, contemplated, and possible capacity of your port?	A litho* is enclosed showing the existing capacity of the port, the work at present in hand, and new works contemplated. Depths obtainable are also shown, these being marked in blue figures at the various berths. The estimated costs of carrying out these new works are:— £ Reconstruction of No. 2 Jetty - - - - 90,528 (in hand). Reconstruction of No. 3 Jetty - - - - 100,000 (Contemplated.) Provision of outer berth at East Pier and extension of breakwater capping - - - 167,000 (Contemplated.) Protecting arm at South Pier elbow - - 36,000 (Contemplated.)	Attached is copy of a brochure descriptive of Port Elizabeth and its equipment. (Not enclosed.)	*See* plan* showing existing and possible capacity of harbour.	Mossel Bay being considerably exposed to heavy south-east seas, as well as heavy land winds from the westward, would require extensive works to provide sufficient protection for the formation of a still harbour. No such works are, however, at this time contemplated.	Existing facilities at the port can deal with 18,000 tons per day, and the contemplated facilities will increase the capacity by about 3,000 tons per day. The possible capacity of the port is unlimited.

III.—EMPIRE DEVELOPMENT.

CAPE OF GOOD HOPE.

Cape Town, Tuesday, 3rd March 1914.

Mr. JOHN WILLIAM JAGGER, M.L.A., Wholesale Merchant and President of the Cape Town Chamber of Commerce, called and examined.

(*For evidence of this witness on "Land Settlement and Irrigation," on "Steamship, Posts, and Telegraph," on "Railways and Harbours," and on "Fruit"* see *pp.* 6, 60, 102 and 317, *and on "Exhibitions," "Statistics," "General Trade Questions," and "Legislation," see pp.* 124, 127, 145, *and* 181 *of* [*Cd.* 7707].

3264. (**Chairman.**) We should like to hear your views on the question of Imperial Development?—I have given some little thought to it, and I do not see how it is going to work as far as South Africa is concerned. The meaning of the proposal put before you in New Zealand is, as far as I understand it, that suppose any Dominion wants to raise a large loan, she has to put it before a board, and if they approve the proposed loan, a guarantee is given on behalf of the other Dominions as well as of the Mother Country. I think you will find in those circumstances that it will only create friction. Take South Africa, for instance. Suppose we want to raise money at the present time, as we have raised loans during the last two years to the extent of something like 14 millions, are we going to ask this board if we shall raise the money? We would say that the money was necessary and we would tolerate no outside interference.

3265. Not for works which interest two or more of the Dominions?—Where should we be interested with any other Dominions?

3266. Might there not be schemes in which the Mother Country and one or more of the Dominions might be interested. Take the question of the mail service for instance between Australia and South Africa?—Do you mean the property of the State?

3267. Yes.—That would be on a somewhat different basis, in which case we would be jointly interested.

3268. I think it was the idea in this proposal that it should refer to work in which two or more portions of the Empire were interested?—Well, I have been a Member of Parliament for twelve years, and I know what the temper is towards anything in the nature of outside interference, so I am very much afraid of the proposal.

3269. And you do not think the economy which would be obtained would compensate for that?—No, I think it would lead to friction.

3270. **(Mr. Sinclair.)** I think you desire to express a very clear opinion that you think your country should be left to do its own borrowing without any outside interference?—Yes.

TRANSVAAL.

Johannesburg, Friday, 3rd April 1914.

Mr. Howard Wallace Soutter, Mr. Alfred Falkland Robinson, and Mr. Ernest Chappell, J.P., representing the Johannesburg Chamber of Commerce, called and examined.

(*For evidence of these witnesses on "Migration, Land Settlement, and Irrigation," see p. 46; on "Posts, Telegraphs, and Steamships, p. 81; on "Bills of Lading," p. 91; on "Railways, Harbours, and Coal for bunkering and shipment," p. 140, of this volume; and on "Exhibitions," see p. 124; on "Statistics," p. 130; on "General Trade Questions," p. 173; and on "Legislation," p. 183 of* [*Cd.* 7707].)

The following extract from a letter from the Johannesburg Chamber of Commerce to the Commission dated February 4th was read by Mr. Soutter:—

Empire Development and Organisation.

The Chamber agrees with the desirability of the appointment of a permanent executive committee of the Imperial Conference to carry out the decisions of such Conference and provide for continuity of the work.

With regard to the proposals—

(*a*) for the establishment of a board and creation of a joint fund for the general purposes of the development of the Empire and its resources; and

(*b*) for a board to assist in the raising of loans for development purposes, on the security of all Dominions.

The Chamber doubts whether it would be practicable to carry these ideas into effect, as the several Parliaments within the Empire would each require to exercise absolute control over their finances, and would be unable to delegate such matters to a representative on a board operating in London.

Mr. Robinson read the following further memorandum:—

Memorandum *re* Empire Development and Organisation.

As already indicated, the Chamber views very favourably the proposal for the appointment of a permanent executive commission of the Imperial Conference, to carry out the decisions of such Conference, and providing for continuity of the work.

In regard to the suggestion to the effect that a board should be created under the title of "Imperial Development Board," whose functions would be, *inter alia*, to advise and assist the various Governments in raising loans for the public utility on the most advantageous terms—the Chamber fails to see what useful purpose such a board could fulfil, at any rate in regard to these particular functions. It is clear that the Government of a country on whose behalf the loan is being raised must be the ultimate judges of how that loan should be raised, and the purposes for which it should be used, inasmuch as they would, of course, have to be the security for the loan, and have to provide for the interest thereon. It is even possible that an awkward position might be created by the existence of such a board. Assume, for a moment, that a Colony desired to raise some particular loan. The proposal would be submitted to the board, who, for one reason or another, might feel compelled to return a negative reply. It is conceivable that such a position might be created, and it goes without saying that the desirability of avoiding such a *contretemps* is too obvious to require discussion. Provided that a permanent body, following the lines of the Dominions Royal Commission, could be created, having for its object the constant study and consideration of the various economic problems that arise within the Empire, and restricting its functions to an advisory and propagandist character, nothing but good could possibly result.

3271. **(Mr. Sinclair.)** Do I gather that you think it would be well that there should be in existence a body that would care for trade as far as trade is common to all parts of the Empire?—**(Mr. Chappell.)** That is our opinion, which we endeavour to set forth. We are distinctly of opinion that we suffer a little owing to the want of continuity in those efforts.

3272. Each Colony of the Empire has conditions that are local, but there are broad phases of trade that are common to all parts of the Empire, and you favour the creation of a body that would care for trade in that sense?—Yes.

3273. And you think that each Colony, as regards its borrowings, would prefer to be independent and, so to speak, to sit upon its own bottom?—We think so. We see a great difficulty in arranging any other basis.

3274. And that is the conclusion that your Chamber has arrived at after giving the matter full and careful consideration?—Yes.

IV.—NATURAL RESOURCES.

(a.) Animal and Agricultural Produce.

CAPE OF GOOD HOPE.

Cape Town, Friday, 27th February 1914.

Mr. HYMAN LIBERMAN, of Messrs. Liberman and Buirski, Produce Merchants, called and examined.

3275. **(Sir Alfred Bateman.)** I understand you have been in business here for about forty years?—Yes.

3276. And you have been engaged as agent or dealer?—As dealer.

3277. In ostrich feathers?—Yes, and other produce.

3278. Have you seen anything of the feather industry?—Yes.

3279. Is Port Elizabeth the great centre for feathers?—Yes, a much greater centre than Cape Town.

3280 Where do you deal?—In the Western Province.

3281. You do not deal in the centre of the industry?—The centre of the industry is as near to Cape Town as Port Elizabeth.

3282. I think I noticed a large increase in the export of feathers?—Yes, including both quantity and quality; also value.

3283. How has that been accomplished?—By increasing the number of birds, and, being a prosperous industry, it has naturally attracted people who like to make money if possible.

3284. It is an easy way of getting money?—Yes.

3285. You have to grow lucerne, do you not?—Yes, for the feeding of the ostriches.

3286. And the ostrich does the rest?—Yes. We have to feed the birds well.

3287. And they do not mind being plucked?—Well, of course, I could not say; but we cannot be cruel to the ostrich, or he would not produce the feathers.

3288. There is no permanent injury to the bird?—No. The wing feathers are generally cut when they are about seven months old, because at that period they are in full plumage, and by rolling in the dust and stones they break the plumage. But you leave the quill for another month or longer until it gets dry, and then pull it out.

3289. **(Mr. Sinclair.)** It dies, does it?—Yes. It is quite possible to pull it out at seven months, but very often it bleeds, and the socket where the quill is growing would be filled up with blood, and naturally it would not produce the same kind of feather again. It would be much inferior.

3290. It does not pay to be cruel?—No, or you would not get any return for your money. The body feathers are of much less value. The second or third row in the wings is generally left much longer than the main wing feathers, because they are not affected the same by getting older as the main wing feathers.

3291. We are going to Port Elizabeth, and there, no doubt, we shall get some evidence?—Yes, I daresay. Oudtshoorn is the great district for feathers, but some people send to Port Elizabeth and others to Cape Town. But the industry is within 100 miles of Cape Town, anyhow.

3292. The policy of the Government, I suppose, countenanced by the ostrich feather-growers, is to keep the industry to themselves? You do not allow export?—For the past few years the export of ostriches and ostrich eggs is entirely prohibited by the Union Government, except to the German South-West Africa Colonies.

3293. Then Australia has to build up its own industry without any help from you?—Yes. I hear there are ostriches in America and Australia, also in Egypt; but they do not produce the same feathers.

3294. I see the next subject you are interested in is grain and forage export. There is not much export, is there?—No. At present we are only exporting oats to India and a little maize to Australia. But the reason I have mentioned forage to Australia is because I would like to point out that, although we are large buyers from Australia, they do not treat us in the same way. A few years ago we had orders from them for forage—oat-hay—and they refused to allow same to be landed there because they say we have glanders or horse-sickness in this country. The Government here is prepared to give a certificate that at those places where the oat-hay comes from there is no such thing in existence, but we have not been very successful in getting a definite reply that the Government certificate would be sufficient.

3295. Will not they take a Government certificate?—No. The Chamber of Commerce have cabled about it.

3296. No doubt you are aware that, when it comes to a question of disease, one Government is not inclined to trust any other?—I do not know the policy.

3297. Well, you may take it from me that that is often the policy of the British Government. For instance, the Portuguese have always been anxious to send their cattle to England with a certificate from their Government, but we have always refused. So you must not think that the Australian Government is alone in this?—No, but they expect that we should accept their certificate.

3298. For what?—For goods or produce we import.

3299. Produce that would bring disease?—Yes, we have had oat-hay from them as well.

3300. Has there been disease in Australia at the time?—Yes, I suppose there has been.

3301. Well, I think you have something more about grain bags?—That is another matter. The Chamber of Commerce at Cape Town has communicated very often with them—that is, with reference to the size of the bags that are shipped. They ship their wheat to us in grain bags weighing about 185 lbs. gross with wheat. These bags are useless for South Africa, because where grain, oats, barley, rye, and wheat are grown the bags in general use are 200 lbs. It is also a loss to Australia, because we could give them 1*d.* or 2*d.* more for them if we could use them. The bags are not merchantable here—that is what it comes to. But they say they cannot do it. I suppose it is on account of strikes, and so on. They have to have a certain sized bag.

3302. On account of what?—Labour.

3303. They will not lift the 200 lb. bag, is that it?—They object to more than 200 lbs., but I do not know whether they will object to actually 200 lbs. As I say, it is a loss to them. Good sound second-hand bags are worth 6*d.* each.

3304. You do not pay for the bag?—But we sell it.

3305. You get it for nothing and sell it for 6*d.*?—We, of course, make an allowance when we buy. We

may ship it back to Australia and get about 2*d.* instead of 6*d.*

3306. Have you anything to say about butter? Is it still imported from Australia?—I want to point out that there is plenty of room in this country to produce butter. We import large quantities from Australia.

3307. Your object is to get more produced here, naturally?—While it costs us here 1*s.* 2*d.* per lb., including duty, I think the Australian people are getting about 9*d.* The Cape has a duty of 2*d.* It comes in cold storage and the freight is high, and it must be kept in cold storage here. It would be a good industry for this country.

3308. You have also something to say about the Government regulations affecting seed potatoes. Do you send seed potatoes to Australia?—No, we are importing.

3309. It is your own Government that you complain of?—We ought not, perhaps, to complain about our own Government, but, nevertheless, the opinion of other people would be of some value. Now, according to the regulations, if we import seed potatoes to South Africa from England, Germany, France, or Holland, we always get a Government certificate that the stuff has come from a place where there is no disease. Black rot, I think, is the disease general there. When the seed comes here they fumigate the potatoes.

3310. You insist on fumigation?—The Government does.

3311. For fear of black rot, and so on?—Yes. That system has been in existence two years. Farmers complain and say that the potatoes do not germinate. They do not produce as much as they used to do previously. They think that fumigation has some effect on the potatoes. For instance, they say that whereas the production was formerly 10 to 1, it is now only about 5 to 1.

3312. Do they know that, or do they think it?—I do not know. We have an Agricultural Department here, and the Government think it is not so. The farmers say they believe it is so.

3313. Why do you not get the assistance of the Imperial Institute in London to find out some method of fumigation which would not affect the germinating power of the potato?—Quite so.

3314. Your growers simply go by the experience of the last two years?—Yes.

3315. There may be some other reason?—Yes, there may be. I have the regulations here.*

3316. You have been in communication with the Department of Entomology?—Yes.

3317. **(Mr. Campbell.)** What is the value of an ostrich? Do you have something to do with the raising of ostriches?—No, but I think I am acquainted with present prices. They differ. You can get an ostrich for 5*l.*, and you can pay 100*l.* and even as much as 200*l.* for a bird.

3318. Is that the average price?—No, they go from 5*l.* upwards.

3319. What would be the average price of an ordinary standard bird?—A bird about two years old, I should say, would be worth 30*l.*

3320 Does South Africa import ostriches from elsewhere?—No.

3321. Have they not imported some during the last few years?—I think so, but they were not a success.

3322. Barbary ostriches?—Yes. There have been some from other countries brought in.

3323. You say the feathers of the South African ostrich are better than those of birds in other countries?—Yes.

3324. Is that due to the improvent of the bird by selection and care?—I think this is the natural place for ostriches.

3325. Cape ostriches are naturally a better feathered bird?—Yes.

3326. Has any improvement taken place in the production of feathers?—Yes.

3327. What is that improvement due to?—Better feeding.

3328. Have not steps been taken to improve the birds by breeding and selection?—Yes, very much.

3329. That has had an effect, too?—Yes, naturally.

3330. What would you say is the average difference between the producing value of a bird to-day and that of twenty years ago?—Twenty years ago the feathers were at a high price. At that time the price of a plucking of feathers was 10*l.*—the average price, to-day it is 3*l.*

3331. Has the decline been so great?—The last twelve months it must have declined 2*l.* It was 5*l.*

3332. Will the industry stay where it is now, or do you expect a further decline or a recovery in the market?—The London brokers think that the next market is not going to be a good one.

3333. Does the industry pay on the present basis?—I think so; unless a man has too much of a mortgage on his farm.

3334. Does it pay the farmer?—Yes, I think so.

3335. What capital would a man need to go into the ostrich farming industry here—supposing he were going into it on modern conditions—to get a decent living?—I think an energetic farmer would get about 25 per cent. on his capital.

3336. What capital would he require to engage in the business on an ordinary basis?—If he had 2,000*l.*, I think it would bring him in 500*l.* a year.

3337. He would earn 500*l.* a year net from that?—Yes.

3338. Would you put that as a minimum amount?—Yes. Land for lucerne is rather expensive.

3339. Is there much land in the Union that is capable of growing lucerne?—Yes.

3340. It is grown, I suppose, by irrigation?—Yes.

3341. It is not grown without irrigation, is it?—No.

3342. As to the export of hay to Australia: as a matter of fact, did not the Commonwealth Government first give permission to admit oat-hay and it was afterwards stopped at the instance of the States Governments?—I do not know. We simply received orders as merchants, but when it arrived there it was allowed to land after fumigation.

3343. With regard to grain bags. You say you could not return them to Australia for more than 2*d.*?—About that.

3344. Is that for bags in good condition?—Yes.

3345. While the Australian farmer is paying 7*d.* a bag you can only get 2*d.*?—Yes.

3346. For a bag in good condition landed back?—It only leaves about 2*d.* here.

3347. You say that a good deal could be done in the way of increasing butter production in this country: have you any suggestion to make to the Commission by which the butter industry could be increased?—I do not think so.

3348. You could not suggest any direction in which you think improvement could be effected?—No.

3349. With regard to potatoes: the restrictions in Australia, I suppose, and elsewhere are largely due to the presence of Irish blight in the potatoes. Have you had the blight here?—No, I do not think so.

3350. You have no difficulty in getting a certificate from Australia that the potatoes are grown in a clean district?—We are not importing from there; from Europe.

3351. Then this is simply a general objection to the procedure of the Government here?—Yes.

3352. Who recommended fumigation?—I suppose the Government themselves.

3353. The Government takes advice from some expert?—Yes.

3354. Do you know if they have sought any advice from outside?—I could not say.

3355. **(Mr. Tatlow.)** Do you import any seed potatoes from Ireland?—We have done so, but very little.

3356. Has not the importation of seed potatoes from Ireland been increasing within the last two or three years?—Not in this country.

* Not reprinted.

3357. You know that Ireland has been a country free from potato disease for a long time now?—Yes.

3358. With regard to ostrich feathers: how long is it since the profit of 10*l.* per plucking prevailed?—Twenty years, I daresay.

3359. And now it is 3*l.*?—Yes, the returns.

3360. Has there been a gradual decrease in price, or is it a thing that fluctuates?—It fluctuates very much. But I think it is more than twenty years since it went down from 10*l.* to 5*l.* It has never come up to 10*l.* since.

3361. Has it ever been below 3*l.*?—Yes, about 30*s.*

3362. Does it change much according to the change in ladies' fashions?—Yes.

3363. Is it possible that it will go up again to a much higher price than 3*l.*?—I think it may. I think the production has also something to do with it—overproduction, very likely.

3364. You say that a man could start a farm with about 2,000*l.*, which would bring him about 500*l.* a year?—Yes.

3365. Is that gross income or is there any deduction for working expenses?—I think it would be a gross profit.

3366. What employment does ostrich-farming require? To how many birds how many men?—As far as the birds are concerned they are all kept in paddocks, so there is really little or no expense for labour.

3367. With, say, 100 ostriches, there is not much labour required?—No, except in regard to lucerne and grain.

3368. What is the life of an ostrich for feather-producing purposes?—I am unable to say, but I should say that after ten years the value of the feathers would decline.

3369. How many more years would they continue to yield feathers?—I could not say.

3370. How often are they plucked?—In two years three pluckings.

3371. In regard to the butter you are importing: do you know what is the prospect of an increase of dairy farming in South Africa? Is there any increase?—There may be a small increase, but the individual farmer does not keep enough cows to be able to produce an even quality of butter.

3372. Your interest includes the importation of butter, does it not?—Yes, we import butter, certainly.

3373. Has the dairy co-operative movement not yet started?—They have had some co-operative dairies, and some failed. Some are still in existence.

3374. Have some succeeded?—Yes. Some have, I believe, but very few, I think.

3375. **(Mr. Bowring.)** Do the ostriches commence producing a second crop of feathers immediately you have plucked the first, or is there some delay?—About seven months after the spadonas or chickens.

3376. You pluck at seven months?—Yes.

3377. In another seven months you have another crop?—Yes.

3378. Every seven months you have a production of good feathers?—Yes. You could not pluck after seven months, though, because it takes about six weeks to draw the quills.

3379. The plucking of new feathers does not commence until then?—No.

3380. That continues for about ten years?—Yes.

3381. The life of an ostrich is about how many years—for production?—I should say that after ten years the feathers would decline.

3382. And become more inferior each year?—Yes.

3383. What age does an ostrich ordinarily live to?—I could not say.

3384. Lucerne is the chief food?—Yes, and grain.

3385. Any particular kind?—Yes, barley and maize.

3386. The trade in feathers, you say, is about equally divided between Cape Town and Port Elizabeth?—Port Elizabeth has the larger trade.

3387. Are the ostrich feathers cleaned and manufactured here?—Not much.

3388. Are they exported in their rough state?—The importer in England objects to us interfering with the feathers in any way. We send them in the natural state to the London market.

3389. There are none manufactured here?—There are some manufactured, but very little exported.

3390. A certain amount for local requirements?—Yes.

3391. How many ostriches can be raised satisfactorily to the acre of lucerne?—I could not say.

3392. The butter imports are very considerable from Australia and New Zealand?—Yes.

3393. Do you prefer New Zealand or Australian butter?—I think they compare about equally.

3394. **(Sir Rider Haggard.)** I suppose there is an enormous increase in the numbers of ostriches compared with ten years ago?—Yes.

3395. Are they doubled?—I do not know that, but I should say 50 per cent.

3396. Is there any official return of the number of birds?—I believe the Agricultural Department could give you statistics.

3397. What do you estimate to be the minimum return per bird that would pay you?—If a man has the ostrich industry by itself I do not think it would pay him if he got less than 50*s.*—that is 3*l.* 15*s.* per annum—a plucking and a half.

3398. Then the thing has got down pretty well to bed-rock if it is to remain a payable proposition?—Yes, I think so.

3399. With reference to this enormous drop in the price of feathers, is that represented in what the consumer pays—I mean the buyer of the feather? Does he pay a very much smaller sum?—I do not think so.

3400. Then the middleman is getting the benefit?—Yes, if the market is high. It is a fancy article.

3401. Have the growers formed any co-operative association in London or in England or abroad anywhere in order that they may secure the middleman's profits for themselves?—It is a very difficult thing to get a co-operative society formed.

3402. Is there any?—No.

3403. Is there any movement towards establishing one?—I have not heard.

3404. Would it not be greatly to the benefit of the grower if they secured some part of what must be an enormous profit now being made by the middleman, seeing that each bird now only produces 3*l.* worth of feathers in place of 10*l.*?—Yes, quite so, but what can you do if there are no buyers? If you produce more than is required it would require several millions to stock it. It is not an article of consumption, it must be remembered.

3405. Do you suggest that the buying of ostrich feathers has enormously fallen off among the peoples of the world?—It has fallen off because people in England and on the Continent do not come to the market now. If there is no demand, they do not come to the market and compete. And in an article of this kind, if you take two buyers out of the market, feathers go down 10 per cent.

3406. Is it a fact that the feathers are not being bought in the great civilised portions of the world?—The fashion is against it at the present moment.

3407. About butter, you have informed us that large quantities are imported from Australia and New Zealand?—Yes.

3408. Could not this country produce all its own butter?—I believe it could.

3409. Is there a large increase in the locally-produced butter?—I believe there is a slight increase.

3410. What proportion is produced locally and what is imported?—I could not say. The Government could tell you.

3411. **(Mr. Sinclair.)** I suppose that both competition and fashion are factors in regulating the price of feathers?—Yes.

3412. And if the industry has extended to the degree you tell us of late years, it follows, almost as a matter of course, that there will be a reduction in the price?—Yes.

3413. Because there has been increased production?—Yes.

3414. And, after all, it is production to cater to fashion?—Yes.

3415. You have not seen the conditions of ostrich feather-farming in Australia yourself, I suppose?—No.

3416. You have not seen the birds?—No.

3417. Do you put down the superiority of the South African feather to the superior breeding of the bird?—I think the soil is more suitable.

3418. Is it due, in your opinion, entirely to the breeding of the bird, or are there local conditions such as specially favour the production of the feather here?—Local conditions, I think, are favourable.

3419. So that even given the same bird in Australia, you do not think the same results would be forthcoming?—No.

3420. Does the difference in the soil to which you refer affect the question by the quality of the food it produces, or in what other way?—I do not know, but I think it is a natural condition.

3421. I wanted to probe it a little further. How does the variation in the soil get to affect the bird in regard to the feathers unless it does so through its feeding?—I do not know. Its feeding has something to do with it.

3422. Is that what is in your mind—the quality of the soil produces a lucerne, or corn, with which the bird is fed that induces a superior feather?—Not necessarily.

3423. I would suggest that it is not quite clear as to how in any other way the soil can affect the feather production of the bird, unless you use soil in the sense of climate?—Yes. I think the climate has something to do with it.

3424. You think the climate conduces to a superior feather?—Yes.

3425. In what way does it bring about that result?—Naturally it would be the climate. It is not very likely that it is the soil in the sense of what it produces—the feeding of the bird—because you can bring the foodstuff from other parts.

3426. Very well, you think it is the climate?—Yes.

3427. When you speak of soil as affecting the quality of the feather you really mean climate then, do you?—Yes, because the Egyptian feathers have been on the London market, I suppose, longer than the Cape feathers, and the price of Egyptian feathers is about 20 per cent. lower that the Cape feathers.

3428. However it may be brought about there is some local condition that produces a superior feather?—Yes.

3429. Is this industry, in spite of falling prices, one that you believe is capable of expansion and extension?—I think so.

3430. The lower price obtainable now is still, as I gather from you, a payable price and is not going to prejudicially affect the industry in the future?—No.

3431. As to the fumigation of seed potatoes: Can you tell the Commission whether the Government has experimented as to the effect of fumigation on the germination of the potato?—I do not think so.

3432. Are there here State farms where matters of that sort are given attention to?—I do not know.

3433. You hold the opinion that in some way or other the system of fumigation adopted has affected prejudicially the germination of the seed?—Yes.

3434. And as regards weight of bags: if I understood you aright, what you want to get is a standardization of bags between the Commonwealth and the South African Union?—Yes.

3435. A bag common to both?—Yes.

3436. That would mean some adjustment on your part and on the part of the Commonwealth in order to bring about a standard bag?—Yes.

3437. Can you tell the Commission whether the Agricultural Department or any other authority has put itself into communication with Australia on the subject?—The Chamber of Commerce here have done so.

3438. With what result?—I am not quite certain, but I believe the result was unsatisfactory.

3439. But is not that due to the fact that in Australia the weight is regarded as being unduly great?—Yes.

3440. Have you not some sympathy with a suggestion of that sort?—We consider 200 lbs. is not too heavy for anyone accustomed to carry bags.

3441. 200 lbs. is a pretty heavy load, is it not? The disposition on the part of Australia to reduce the size of the bag is in order, is it not, that the weight that has to be carried by the wharf labourer shall be less?—Yes.

3442. You would have some sympathy with such a suggestion within reasonable limits, I gather?—Yes.

3443. **(Sir Jan Langerman.)** Do you know the value and quantity of seed potatoes imported into this country every year?—I could tell you the price, but not the quantity.

3444. Could you tell us why the Cape growers of potatoes do not grow their own seed?—I think you will find in Europe they always import from outside places.

3445. From where?—England, from Germany or Holland. I think it is an advantage to import from other parts.

3446. As a change?—Yes.

3447. But we do not produce seed potatoes to export?—No.

3448. Why?—Because we get too high a price for table potatoes.

3449. How does the seed potato that we buy here compare with the local price that we get?—You have the duty of 1*s.* 6*d.* a hundred pounds, or 2*s.* That makes it dearer, and then there are freights by the mail boats and packages and cases. It is not the price in France that is so high. Early seed potatoes are imported mainly from there. It is the freight from Bordeaux to Southampton and out here and the packing which makes it so high.

3450. What is the cost of a box of potatoes? Would it be three times the value of a similar box of potatoes sold here for the table? What is the difference in value of the two?—I should say 50 per cent.

3451. Where he would get for his box 5*s.* he gets, say, 7*s.* 6*d.*?—Yes.

3452. With regard to the ostrich industry: you have never bred or farmed ostriches?—No, but I have lived in the districts.

3453. You have told the Commission that in order to get 500*l.* gross a man would require a capital of 2,000*l.*?—Yes.

3454. How would you distribute that 2,000*l.*?—I should say half would go to the farm.

3455. I am talking of a man coming from oversea. He buys the bare farm and wants to start with 2,000*l.*?—He would have to put up with a very cheap building.

3456. 1,000*l.* would go into the ground?—Yes, and ostriches.

3457. How far would that go to get irrigable land to grow lucerne for ostrich feeding. You know they pay as much as three and four hundred pounds an acre for such land in Oudtshoorn?—Yes. They have paid it but I do not think they pay it any more.

3458. What do you think is the lowest price to-day?—You can get good farm land at about 10*l.* an acre.

3459. I do not think you would get an acre under 200*l.* in the Oudtshoorn district?—I am not speaking about Oudtshoorn. Many Oudtshoorn farmers have sold their land there and bought land in other parts where they can get it cheaper.

3460. What do they pay in other parts?—About 20*l.* a morgen.

3461. But really you cannot speak with authority as to what you can do in the way of starting a farm?—No.

3462. **(Mr. Garnett.)** Are you actively engaged in ostrich-breeding?—No.

3463. You say there has been a very great improvement in the type of bird, which I presume has been obtained by careful selection and in-breeding?—Yes.

3464. Have you any knowledge of what the effect of in-breeding has been on the constitution and stamina of the birds?—No.

3465. **(Mr. Tatlow.)** Is the dead bird of any value?—No, with the exception of the feathers.

3466. Is he killed after a certain number of years when the plucking is no longer profitable?—I do not know.

3467. When he is dead there are feathers which may be of some value?—Yes.

Mr. P. G. VAN BREDA, Produce Merchant, called and examined.

3468. **(Sir Alfred Bateman.)** You have come to tell us about certain produce that you are interested in exporting?—Yes.

3469. You have not sent in any précis?—No.

3470. The four items I see here are mohair, hides, skins, and wool?—I have also been connected a deal with ostrich feathers.

3471. Anything that is of interest to the questions we are dealing with we shall be glad to hear about, and in regard to any obstacles that you know of in connection with the Customs and trade regulations in other countries that hinder you, and which you think could be advantageously altered. As regards mohair, it is an increasing trade, is it not?—Yes, although the value of the mohair at present sent away is not so high as in years gone by. The amount has, however, increased. Here in Cape Town we do very little. Port Elizabeth is the great centre. I do not suppose we do one hundredth part here.

3472. You do something in wool?—Yes.

3473. Have you anything to tell us about wool?—That is gradually increasing. We ship from 25 to 30 thousand bales a year from Cape Town alone.

3474. I was here seven years ago, and we were told then by representatives of the wool trade that you suffered in two ways : that you did not get your wool carried as cheaply as you ought to?—Yes, that is so. The freight from Australia was $\frac{1}{4}d.$ and we always paid $\frac{3}{8}d.$ with a rebate. And ours was a lesser distance. The argument against that was, of course, that the shippers could not get return freights for half the year, whereas from Australia they have a full return cargo.

3475. Are those rates in force now?—The $\frac{3}{8}d.$ is still in force, but they have taken off the 10 per cent. primage, and the rebate. They give 10 per cent. discount now.

3476. Another complaint was that your wool was not important enough to govern prices in the European markets?—I do not know. You see, in Australia the wool is brought in by the different farmers. They take it to certain centres, where it is properly selected, whereas here we have no such institution. Each farmer must do his best. If he is running from three to ten bales only, he has not got the appliances to so severely sort his wool as the Australian grower.

3477. Have you any large holdings for the growing of wool? Not like Australia, I suppose, where they extend for hundreds of miles?—No. We have some very influential farmers who have clips of wool from 120 to 150 bales. But that is the highest we have at present, probably.

3478. Is it an increasing trade?—Yes, I fancy so. Certainly I think the get-up of the wool has improved during the last four or five years.

3479. And you have had rather better prices, have you?—Yes.

3480. Do you have to study the conditions in the markets, such as the reduction and taking off of the duty in the United States, for instance, on wool? Does it affect you?—So far it has not done so very much. It has not seriously affected the trade here to my knowledge. They certainly expect it to do so. Contrary to expectation, the market has not gone up as much as the people thought it would.

3481. Perhaps you anticipated that?—It was anticipated, but it did not come off.

3482. What is the proportion of wool exported from this port to the export from the whole of the Union of South Africa?—From Port Elizabeth last year they exported 102,000 bales, whereas from here we only exported 22,000 bales.

3483. It is a smallish proportion?—Yes. Port Elizabeth is geographically the centre of all the wool districts.

3484. Now, passing to hides, is that a big trade here?—That trade is, again, mostly done from East London. That is the geographical centre from the Transkei Territory. We ship very little.

3485. Have you any criticism to make as to the conditions under which hides are exported and the regulations governing the trade, and the freight charges?—No, I do not think I have any complaints to make on that score. I think it is a fair charge which is made at present. They charge $\frac{3}{8}d.$ net.

3486. You have complaints from the consumers in regard to the branding of the hides injuring the leather?—Yes, that is a complaint in this country, certainly.

3487. Has any attempt been made to remedy it?—No, not very much. The chief complaint has been made in regard to the branding of sheep skins with tar. That has been a very serious thing.

3488. In the case of hides, I suppose the legible branding is necessary in order to distinguish the cattle of one owner from those of another?—Yes, that is what I understand it is for.

3489. Is it essential?—I should fancy so. I am not a farmer.

3490. As regards goat skins?—In regard to sheep skins they used to do it all with tar, and, of course, especially in connection with merino sheep, it is most difficult to get all those marks out. They have to be specially cut off in the combing mills, and if by accident these tar pieces get through without being seen they, of course, form a blemish on the manufactured article.

3491. Is the trade in all these four articles increasing here through Cape Town?—Not in a very marked degree, but there is, I think, a gradual increase.

3492. You have the shipping that you require to take the goods to Europe?—Generally speaking we have ample, except at the height of the wool season—in the months of October and November. Then there has been great difficulty in getting all the stuff away.

3493. Now, I understand that one of the existing disadvantages which you experience is the want of co-operation among the farmers in the shipment of their wool?—Well, from a merchant's point of view, of course, we do not believe very much in co-operation, but I think personally that the farmer gets a much better price by selling his wool locally than if he were to ship it himself. Several farmers have done so and they found that they would have done better if they had sold here.

3494. But if the farmer decides not to sell locally, he is at a disadvantage in having to ship small quantities, which he may not have the conveniences for carefully classifying?—Yes.

3495. Can you give us any idea of the respective quantities that are sold locally and that are shipped?—No.

3496. You have no records?—No, I have not. It is a very difficult thing to know whether a man has sent his wool to be shipped or sold locally previously.

3497. You do not know whether the bulk of the wool is sold locally or shipped?—By far the bulk is sold locally.

3498. As regards the prices, is the price which is obtained locally, do you think, as high as that which is obtained by shipping direct to the London markets?—Certainly. The fact is often proved that shippers, after buying wool here and sending to the London market, get account sales with a balance on the wrong side.

3499. They have had too big advances on account, if that happens, I suppose? You merchants would look after that. Now about the damage the fleeces suffer from tar : does the branding not take place after the sheep is shorn?—Yes, it does, but I cannot speak with authority on the matter as I am not a farmer. But I rather fancy you could not brand the sheep immediately after being shorn. You would injure it too much. I should not imagine the branding could take place until there is a certain cover of wool on the sheep, and that would grow out with the wool.

3500. As regards the branding of hides You have had numerous complaints, as I understand?—Yes.

3501. And there is no co-operation, nothing has been done systematically?—No. As I said before, East London is the great centre for that.

3502. Now as regards the demand which was expected from the American market for wools, can you tell us generally what classes of wool are principally grown here—the finer wools or the coarser varieties?—The finer wools.

3503. Those are the wools that America takes?—Yes. But they only took the light conditioned wools on account of the duty before. Now, I do not know what will happen.

3504. You will expect, not unnaturally, that there would be an expansion in the classes of wool that America would want after the removal of the duties?—Yes.

3505. There has not been much time yet to form any opinion?—No, not yet.

3506. Have you any complaints at all to put before this Commission on the question of freights—either as regards wool or anything else that you export from this port?—Well, I think the freights are fairly reasonable now. I do not think we have much to grumble about.

3507. **(Sir Jan Langerman.)** I see you export mohair, wool, hides, and skins; are there any industries in the Union based on those products? Have you any manufactories where you can use up these raw materials locally?—There is the blanket factory at Ceres Road.

3508. To what extent would that consume?—Only a very limited extent.

3509. Other manufactures you have not got?—Not of any account.

3510. In mohair?—No.

3511. Hides and skins?—Yes, very large tanneries.

3512. Are those tanneries equal to supplying the demand of the Union?—I believe they are, but, strange to say, a large quantity of leather is still imported from Australia.

3513. Manufactured leather?—Yes.

3514. To what is that due—that the local article cannot compete against the imported article?—I cannot say. But the fact remains that they can lay down the imported article and pay freight from Australia and still put it down at a cheaper rate than the local people can manufacture.

3515. From whom can we find out the reason why it is so?—Colonel Woodhead can give you all the information.

3516. The tanners themselves?—Yes.

3517. Why is it that the manufactured article can come five or six thousand miles and compete with the local article?—I cannot say.

3518. And there are large importations from Europe as well?—Yes, and also from America, though that has fallen off. We used to get large quantities of sole leather from America.

3519. Have you formed an opinion as regards the quality of the leather which is imported? Are you of opinion that the Australian is better than the South African?—No, I could not tell you that with any degree of certainty.

3520. Or is it that the imports here are more favourable to the exporters from the other side than is the similar case of Australia—that we cannot export to Australia, their tariff being more prohibitive than ours here?—I cannot tell you that.

3521. **(Mr. Bowring.)** Can you tell us where the large tanneries are situated here?—There is Sanderson's of Woodstock. He is, I think, one of the largest tanners. And there is another at Wellington, and we have two very large tanneries in the Mossel Bay District—one of Searle and one of Meyer.

3522. Have you any idea where they get their oils and greases from for tanning purposes?—They import them, I think.

3523. You do not know where from?—No.

3524. **(Mr. Tatlow.)** I see from the official return of exports for the year 1912 that hides and skins show a very large increase over 1911. Sheep skins, 727,000 against 577,000. In the case of ox and cow hides it is nearly double, and these figures are very large compared to any previous year back to 1906. Is there any particular reason why 1912 shows such large increases compared to 1911, or is it only the gradual growth of the business?—I think it is a gradual growth.

3525. We have no figures officially for 1913; but have you any knowledge how 1913 would turn out?—As far as hides are concerned, I think it will turn out well. The price of hides during the past year has been higher than it has ever been before.

3526. Was the price in 1912 much higher than in 1911? Is the increase accounted for by the difference in price to any extent?—Yes, twopence to threepence per pound.

3527. In wool you do not show such large increases? What would account for the difference? Prices were good?—Yes.

3528. Was it a diminished quantity?—I should say so.

3529. That looks as if it is not going on satisfactorily?—No.

3530. **(Mr. Campbell.)** I think you said that the wool grown here was chiefly fine wool; I suppose South Africa depends largely on Australia for stud stock?—Yes.

3531. There has been a considerable import of fine stud sheep from Australia?—I know several rams have come over.

3532. Do you find that the Australian Government places any restriction on the export of these?—I do not think so.

3533. With regard to the South African wool production; I suppose that you find a very great deal of difficulty arises from the fact that the wool being grown on smaller areas than is the case in Australia, there is difficulty on the part of farmers here in classing it properly?—Yes.

3534. Has the Government here never taken any steps to give systematic instruction in wool classing to farmers?—Yes, on several occasions. There was a big wool conference at Port Elizabeth once.

3535. I mean is there no technical instruction given at institutions where the sons of the farmers or the farmers themselves can, by means of practical demonstrations in the wool sheds, learn from expert teachers the knowledge of classing wool?—I believe that can be done at the agricultural colleges.

3536. Has it been done?—Yes, but with very little actual result, except in the Caledon district. The wool is better classified there.

3537. Is that a Government institution—Caledon?—No.

3538. Who carries out the instruction you speak of?—To a certain extent, one of the Government people—McKie. He has been going round the country showing the farmers how the wool should be manipulated and the sorting.

3539. You have no technical school, then, where the wool classifying is taught?—Yes, at the colleges.

3540. Do students who go to the colleges for the purposes of learning the wool business travel round the country and get practical experience in the working of the wool on stations and farms?—I could not say that. I do not think so.

3541. I suppose you know that in Australia, in consequence of technical instruction in wool classing, the quality of the classing has been largely raised, and the value of the clip largely increased?—Yes.

3542. The wool that is shipped from here—is it shipped direct to Bradford or does it go *viâ* Southampton?—Very little goes to Bradford I think, I think the bulk of it goes to Continental places *viâ* Southampton.

3543. Would there be any advantage to send it direct if it were possible to arrange—sending it to Hull, Liverpool, and places which communicate with the wool districts directly. Would there be any saving?—I do not think so. Very little wool is consigned to Liverpool.

3544. You sell to Bradford direct?—Yes.

3545. In shipping wool—do you find you can send as cheaply *viâ* Southampton as Hull?—Yes. There is no opportunity of sending *viâ* Hull. There are not sufficient steamers.

3546. You do not know of any being sent that way? You have not investigated the comparative freights?—No.

3547. Is dipping of sheep extensively practised?—Yes, and there is not nearly as much scab now as formerly.

3548. Is dipping compulsory under Government regulation?—Yes.

3549. How many times a year?—Once.

3550. Have you any regulations concerning the branding of cattle and horses?—I am not sure.

Mr. ALFRED H. OXENHAM, Wool Expert of Messrs. Ebel and Co., Ltd., Wool Merchants, called and examined.

3551. **(Chairman.)** You have heard the evidence of the previous witness—have you anything to add to it?—I am pleased to tell the Commission, in the first place, that this is the first year that the exports of wool from this country have exceeded 500,000 bales. One gentleman of the Commission wished to know why it was that, as far as sorting was concerned, the wool itself fetched such a small price. It is really the fault of the middleman, I may explain. The shopkeeper gives the farmer the same price for his clip whether it is good or bad; therefore, as far as he is concerned, he has no particular interest to improve the quality.

3552. There is no inducement to produce good wool?—No. In certain districts, about eight or nine years ago, we induced the farmers to come together and have sales, as in Caledon. They started the wool sales with about 150 or 200 bales. Last year it was 1,750 bales. There has been a marked increase in the production of wool in that district, and marked benefit to the quality, owing to the buyers from Cape Town going down there and buying for quality and general condition. We are not placed exactly in the same position as in Australia. There, I believe, the bulk of the wool comes into the centre and is put up for sale. It is not so here. The bulk of it is bought in the country here by the storekeepers and they send it to the port and the buyer gets it from him. It is the middleman who secures the wool for the buyer.

3553. The result of that system has diminished the inducement to produce good wool?—Yes.

3554. How could that be altered?—That could be very well altered by having large wool sales in the different centres. Take Worcester, for instance. They could have a sale there which would tap the Fraserburg, Sutherland, and Laingsburg Districts, and get about 1,500 bales. The buyers would proceed from here and buy the wool on the market. The man who had sorted his wool would then get the better price.

3555. Could that not be arranged without the intervention of the Government—by agreement between the buyers and the farmers?—We have tried it, but in only three centres, I think, have we succeeded in getting it done. That is Swellendam, Caledon, and Riversdale.

3556. Wherever it has been established it has succeeded?—Yes.

3557. And where you have not been able to establish that, what opposition has made it impossible?—I think principally it is the system under which the farmer has to buy his goods from the small storekeeper and he pledges his clip in payment for his goods, and is therefore tied.

3558. He is indebted to the storekeeper?—Yes.

3559. Even the storekeeper might prefer to sell by auction or at a large sale than send it here?—Yes, but that would, of course, be of no benefit to the farmer himself. Another question was this—whether it would be better for the farmer to ship his wool direct. Well, the farmer who ships to the London market is at a disadvantage, because the man who buys direct for the manufacturers saves all intermediate expenses, which the farmer, as shipper, has to pay on London sales. So the man who buys direct can afford to pay from ¾*d.* to ½*d* per lb. more for the wool than the farmer can get in London.

3560. **(Mr. Sinclair.)** Does he use the wool that he buys locally—I mean does he use it for manufacture locally?—There is only one manufactory here and that is the blanket factory of Harris Brothers. That takes principally bastard or coarse wool. The market for merino wool is not in this country, and that is the chief kind of wool grown here.

3561. **(Chairman.)** What other points are there?—As far as the mohair industry is concerned Port Elizabeth is the port for it. Cape Town last year only shipped 156 bales, as against 24,703 from Port Elizabeth.

3562. With regard to the establishment of these local sales, has the Government taken any action or has the matter been debated in Parliament?—No, it is simply a matter between the buyers and the farmers themselves.

3563. Are the buyers unanimous in desiring it?—Yes.

3564. How many firms are there interested?—Do you mean in the Union, or only in Cape Town?

3565. In the Union.—I suppose there must be about 40 or 50 firms altogether.

3566. All those would be in favour?—In Port Elizabeth, East London, or Durban the buyers are, because their wool goes direct to the port. You see, 90 per cent. of our wool goes to Germany.

3567. Why there, in preference to other markets?—Well, Germans, I think, prefer our wool to the Australian. The Bradford people only get the inferior or medium quality from here. The Germans take the best wools that are grown in this country, and the best wools come from the Kaffrarian districts and Mossel Bay. That wool fetched last year 12½*d.* per lb., and compares very favourably with some of the wools grown in Australia.

3568. Is there any special technical reason why the South African wools go to Germany in such large proportions?—A lot of South African wools are used for the purpose of making military cloth, and a lot of short wool is used for the fez caps which the Turks wear.

3569. Is the bulk of it made from your wool?—Yes.

3570. What is the characteristic of the South African wool compared with the Australian?—There is only one thing, I think, in favour of our wool, and that is its softer handling. The Australian wool makes a harsher top than the South African variety. Whether the reason is in the climate or not I do not know. It is exactly the same in regard to the ostrich feathers. This is the home of the ostrich, and the same kind of feather will never be produced in Australia.

3571. Do they get harsher feathers too?—They are very much inferior to ours.

3572. **(Sir Rider Haggard.)** You told us that there has been a considerable increase in your output of wool this last year?—Yes.

3573. Do you anticipate that that increase will continue progressively?—Yes, provided that we have good seasons. We have had the drought throughout the country this season, which is bound to affect the wool trade to a great extent. It means diminished quantity. But given ordinary seasons, our wool industry should gradually increase from year to year.

3574. Can you tell us at all to what extent it may increase?—Yes, but it would take a very long time.

3575. It is not from lack of land?—No—from lack of moisture. You see this is a very droughty country, and we have not many irrigation works.

3576. Supposing the irrigation policy of the Government is extended, would that affect the sheep industry?—To a tremendous extent.

3577. By growing lucerne?—Yes.

3578. There is a possibility, therefore, of a very large increase depending upon irrigation activities?—Yes.

3579. You spoke of a system of the storekeepers advancing money to the farmers, and thereby getting hold of the wool. Is that very common?—It is in

the Western Province. I do not know whether it is so much in the Eastern and Natal Districts. I do not think it is.

3580. I suppose I should not be far wrong if I described it as a thoroughly bad system?—Yes, bad for the farmer.

3581. The result of the system is, I presume, that the prime producer must sell his wool to that local storekeeper?—Yes, and must suffer.

3582. He must sell at the price fixed by the storekeeper?—Yes.

3583. Do you see any method by which the evils of that system can be mitigated or abrogated?—No, the only way is for the farmer to get wealthier, so that he does not need the credit.

3584. Would not co-operation be a remedy?—Yes.

3585. And credit banks?—Yes.

3586. Are there any steps being taken to establish the co-operative and credit banks among the farmers?—No.

3587. If such things could be established, would they not be a big factor in increasing the prosperity of the farming industry?—I think so.

3588. **(Mr. Campbell.)** When you speak of central markets for the wool, I presume you contemplate central markets at which the buyers would attend from here?—Yes. You see in this country we have buyers from all over the world. I mean, buyers here do not only buy for Bradford and Germany, but for France, Russia, and America as well.

3589. The local buyers buy for foreign firms?—Yes.

3590. But would not these central sales eventually have the result of attracting the direct representatives of Bradford and German firms to South Africa as buyers?—Yes, there are several of them here now as a matter of fact.

3591. And in that way the local buyer would probably lose some of his business?—Not necessarily. I take it the local buyer's knowledge is better than the imported article.

3592. But has not the result in Australia been to induce the firms to send out direct buyers who deal directly at the wool sales with the selling auctioneers?—Yes, but when you remember that Australia exports 2,000,000 bales against our 500,000, it makes some difference.

3593. But you are optimistic that the South African wool will some day successfully compete with that of Australia?—I should like to see it. I have been thirty-one years in this trade, however, and it has not come along yet.

3594. South Africa is a fair producer of fine wool. The class of wool that is very largely needed in Bradford is sold to Germany?—Yes.

3595. Do not you think the buyers would come here direct and deal straight with the wool producer through the auctioneer?—Yes.

3896. I suppose the result would possibly be that there would be an increased profit for the farmer? He would get a better price?—Yes, the more competitors the higher the price.

3597. Speaking now about the classing of the wools, you would support what Mr. van Breda said with regard to the need for better classing of the clips here on the farms and stations?—Yes. We have a Government expert here. The Government has gone to a lot of trouble to get experts from Australia and the old country, and sent them out to various districts, and the farmers have done it for one or two years, and they have then declared that it did not pay them. You can quite understand that if I am sending my wool classed and others are not, and I get the same price as they do, I am not going to do it. That is the fault of the wool being bought by the storekeeper.

3598. Does not the remedy lie rather in getting the young people in the technical schools and giving them instruction in wool classing?—Yes, that is what we are now doing in the colleges at Middelburg and Elsenburg.

3599. Are those colleges largely made use of?—Yes.

3600. And they are, generally speaking, successful, so far as the dealing with wool is concerned?—Yes.

3601. What would be the date of the wool sales here? Supposing these central sales were instituted, in what month of the year would they be held?—Our principal month for wool sales is October.

3602. You would get ahead of the Australian sales, and it would be a well-timed trip for wool buyers to go right round?—Yes.

3603. **(Mr. Garnett.)** You spoke about the great increase in wool. Is that increase due partly to numbers and partly to improvement in the weight of the fleeces?—Both.

3604. Could you say how much the weight of the fleece has increased in the last twenty years?—Well, ten years ago our sheep averaged, I think, 3½ lbs. weight of wool. And now they have gone up to 8 or 9 lbs. That is the improved breed.

3605. Your improvement in the weight of the fleece has kept pace with the improvement in other parts of the world?—Yes.

3606. You say nearly all your wool goes to Germany?—Yes.

3607. Bradford and the West Riding are perhaps the greatest consumers of wool in the whole world?—Yes.

3608. And they are on the look out for wool?—Yes.

3609. Would I be right, therefore, in drawing the conclusion that the style of wool you produce is not particularly suitable for use in the Bradford market?—Yes. I would say that would be a very fair conclusion to arrive at. As I said before, the best of our wool goes to Germany.

3610. But you would not impute it to neglect on the part of Bradford buyers altogether. You know they take what suits them best?—Yes, I suppose that would be so. But I see no earthly reason why Germany can use the wool and Bradford not.

3611. Of course, there is a difference in the fabrics, and a difference in the machinery?—Yes.

3612. **(Mr. Sinclair.)** Has the existence of the duty anything to do with the finer qualities of the wool growing?—No. To the best of my knowledge there is no duty in Germany on wool.

3613. Only the lighter wools went to the United States when there was duty?—Yes.

3614. I do not follow you in regard to the price that you thought the local buyers could give for the wool. I understood you to suggest that they could afford to give higher prices than would be obtained for the wool if the farmer shipped to London himself?—Yes.

3615. Would you mind developing that a little?—It would save all commissions, warehouse charges. In the first place, the broker on the other side charges 1 per cent. You have a slight expense also in other ways—that expense he would save.

3616. But is the wool you buy locally intended for local use?—No, for shipment.

3617. Have not those charges to be borne anyhow?—No, they are saved. No middleman comes between. It goes direct to the manufacturer.

3618. Is that wool bought locally, then, for speculation?—No. You are on the other side of the water. Take tops, 2*s*. 8½*d*. I have to guarantee to deliver those at that price. It does not matter to you what it costs on this side.

3619. If there is a difference, the local middleman gets it and not the grower?—Yes. But we were speaking of farmers shipping direct to the London sales.

3620. But in the absence of the sales that have been spoken of, the grower must either take the price that is offered by the storekeeper or take the risk of shipment with the knowledge that shipping small quantities is to his disadvantage?—Or he can forward it to the seaport towns, where it would meet with genuine competition.

3621. They have sales at the seaport towns?—Yes, every week.

3622. **(Sir Jan Langerman.)** Supposing that on the London market Australian and South African wool of equal value are placed, is there not a tendency in the market there to give a lower price for our wool simply because it is South African?—So we have heard. But I think it is all a question of yield. Australian wool is a better yielder than ours. Of course, there are some Australian wools which yield equally as bad as ours.

3623. There is an unexplained prejudice against our wool?—Yes.

3624. That can only be met by proper classing?—Yes.

3625. You may have heard of a case where South African wool was withdrawn from the London market and sold as Australian wool and fetched a higher price?—I have heard of such cases, but I do not place much confidence in that. I have heard three years ago that some man here sent his wool to Australia and it was sold in England as Australian wool.

3626. I know it was true in the Transvaal. How would you recommend that this prejudice be overcome?—Getting the wool up better. But we have small farms here as compared with Australia, and it does not pay a man to turn eight or nine bales into four or five different sorts of wool.

3627. Is it your opinion that South Africa can grow equally as good wool as Australia?—No.

3628. Whatever they may do in selection and in better classing?—Well, they may ultimately, but I do not think I shall ever live to see it.

3629. Why is it—is it climatic conditions?—Yes, and the general get-up of the wool itself. Our farmers do not take the trouble.

3630. That is not the point. The quality of the wool itself—and not the classification. Do you think we can produce as good a quality of wool as Australia?—Yes, but I do not think you will produce as good a length of wool as they do. I think the climatic conditions are against you, because any farmer will tell you that in this country, after the sheep has been shorn for a certain time, the wool commences to fall off, and that it starts falling off before it has attained the length of the Australian clip.

3631. That is why you always import new rams to keep up the length of the staple?—Yes.

3632. **(Mr. Tatlow.)** This system of the small woolgrower having to dispose of his wool to the shopkeeper—does it largely prevail?—Well, largely in the Western Province.

3633. What sort of shopkeepers are they—I mean what are the goods they deal in?—General merchandise—groceries and so on.

3634. All that the ordinary man and his household requires?—Yes.

3635. Does it mean that the man is usually in debt to the shopkeeper? Is he obliged to sell in order to liquidate his debts?—No, I would not say usually, but it is the custom or habit.

3636. It might be broken though without any great difficulty?—Yes.

3637. Are there no agricultural societies or farmers' associations that can come to the rescue of the farmer by co-operation?—Well, we have our agricultural societies, but they do very little in that direction.

3638. There are other countries where the farmer has liberated himself from the influence of the shopkeeper in that way—by spontaneous effort and in establishing such associations?—Yes.

3639. Have you any hope of that here?—No. I cannot say we have.

3640. Is it a thing that presses very heavily upon the grower of the wool? Does he sell at an unduly low price?—He does not seem to mind.

3641. Regarding the export of wool to Germany: I think you said the bulk of the wool goes there?—90 per cent.

3642. That is scarcely borne out by the figures for 1911: It shows about half and half to the United Kingdom and Germany?—Well, the wool goes to the Port of London, and the London statistics take it that this wool is for England. That is not so—it is in transit.

3643. Then the English figures include sales to Germany?—Yes.

3644. Are you sure of your statement?—Yes.

3645. These figures certainly require some explanation?—Yes.

3646. Because the actual figures for 1911 are:—United Kingdom, 130,000; Germany, 146,000.

3647. **(Mr. Garnett.)** Can you give us the highest price that has been realised for any lot of wool during this last season?—One lot I bought in Caledon at 12½*d.*—that was the highest. In Mossel Bay it was 12⅝, and at East London 12½ was the top.

3648. That is the highest class?—Yes.

3649. Scoured?—That has gone up to 2*s.* 0¼*d.* (since 2*s.* 1*d.*).

3650. That is the highest price for scoured?—Yes.

3651. **(Sir Alfred Bateman.)** What was the price in London? How would it compare with the other figure?—I suppose 12½ would mean 13½ or 14 in London.

3652. As compared with wool from Australia at the same time. At that time was wool dear or cheap?—It was dear.

3653. So that really does not represent a very high price?—We reckon it is high. We reckon wool is dear to the buyer.

3654. You cannot quote the price at the same time? There is no standard?—No.

3655. Do these storekeepers supply alcoholic drinks, too?—I do not think so. No, they are outlying stations.

3656. They are small people?—Yes.

3657. Not branches of large stores as in Australia?—No. Nor like Mosenthal's in the Eastern Province. They are chiefly Jewish storekeepers; they own most of the shops.

3658. The farmers have to deal with them really?—The distances are so great and it is the most convenient way, I suppose.

3659. Would not land banks advance the money?—There is one—the Government Land Bank, but I do not think the small farmer can go to them.

3660. Are the farmers tempted to begin an account with these storekeepers for the year with credits and debits—getting all their stores for the year, and then the wool goes as the credit?—No, I think it is a case of necessity. The storekeeper happens to be the nearest man.

3661. The farmers are not making so much money that they can afford to act independently?—No.

3662. The farmer is a small man here?—Yes.

Cape Town, Monday, 2nd March 1914.

Professor H. H. W. Pearson, M.A., Sc.D. (South African College, and Honorary Director of the National Botanic Gardens, Kirstenbosch), called and examined.

3663. **(Sir Alfred Bateman.)** You are "Harry Bolus" Professor of Botany at the South African College and Honorary Director of the experimental botanical station at Kirstenbosch?—Yes.

3664. And you have prepared and sent in to the Commission a memorandum on the subject of medicinal plants and drugs, &c. Will you please go through it and give us the chief points?

The following is the memorandum submitted by the witness:—

At the request of the South African Officer of the Dominions Royal Commission, I propose to give evidence on the subject of the experimental cultivation in South Africa of certain economic plants, especially those yielding drugs, perfumes, and dyes. I also add notes on the cultivation and improvement of South African garden plants and on the functions of the recently-established National Botanic Gardens.

At the outset I wish to make it clear that I am treating the subject from the botanical and horticultural standpoint only. I possess no special knowledge of drugs, perfumes, or dyes as such. Information has already been furnished to the Commission by experts in the production and use of these products, viz., Messrs. J. C. Umney, J. H. E. Evans, K. C. Allen, E. M. Holmes, E. V. Barrett, and Professor Greenish. I have read the evidence given by these gentlemen, and have considered the possibility of establishing in remunerative cultivation here the economic plants mentioned by them as worthy of attention in the Colonies. I have also referred to some others which have not previously been mentioned in evidence.

All the plants named in the lists given below, or in a few cases native species which may prove to be adequate substitutes for them, will as soon as possible be under experimental study in the National Botanic Gardens at Kirstenbosch. A few are there now, others are expected immediately, the remainder will be obtained as opportunity offers.

The climatic conditions of Kirstenbosch are, in essentials, those of the coast belt lying between Port Elizabeth and the mouth of the Oliphants river. They reappear on the extensive range of the Kamiesberg (mostly a native reserve), in Little Namaqualand, and in some other localities. It is this region which I have kept particularly in mind in considering the question of cultivation of exotic economic plants.

The conditions of plant life in the great inland plateau are different in many important respects from those prevailing here. The south-west coast belt, as defined above, offers the most promising field in South Africa for the economic cultivation of the plants yielding the drugs and perfumes which have been particularly instanced by previous witnesses. Among the native plants of possible economic value a large proportion are more likely to succeed in the conditions of the plateau than in those of the coast belt.

It will be convenient to consider the subject in four divisions, viz.:—

(1) Plants of exotic origin yielding drugs, perfumes, dyes, &c.
(2) Plants of native origin yielding drugs, perfumes, dyes, &c.
(3) South African garden plants.
(4) Economic functions of the National Botanic Gardens.

I.—*Plants of Exotic Origin yielding Drugs, Perfumes, Dyes, &c.*

It is a well-known fact that a considerable number, probably the majority, of these plants are either native of the countries bordering the Mediterranean or have been in cultivation there, mostly for very long periods.

The south-west coast belt of South Africa enjoys a climate which in its main characteristics resembles that of the Mediterranean, *i.e.*, the rainfall occurs mostly during the winter months, and the mean, maximum, and minimum temperatures have similar ranges in different parts of the two regions. Since these two climatic factors have a profound influence upon vegetation, the plants of the one region may be transferred to the other with a considerable probability of success. Economic plants established in the Mediterranean region are therefore eminently suitable for experimental cultivation in the south-western coast belt of South Africa. The truth of this hypothesis is sufficiently supported by the success which has attended the introduction of the grape, the citrus fruits, the olive, and the mulberry into South Africa.

The native vegetation of this south-west coast belt, in common with that of some other parts of South Africa, resembles that of the Mediterranean in two characters, which are of great importance in connection with many of the plants now under consideration. These are the abundant production of flowers and of essential oils. We have, therefore, reason to expect that economic plants whose value depends upon their yield of flowers, fruits, seeds, or essential oils, if they can adapt themselves to South African conditions, will give a large return.

The following list of exotic economic plants recommended as suitable for trial here makes no pretence to be complete. It is based mainly upon the information furnished by previous witnesses. It indicates the nature of the experimental work already commenced or in immediate prospect in the National Botanic Gardens.

List of Plants, yielding Drugs, Perfumes, Dyes, &c., suitable for Experimental Cultivation in the National Botanic Gardens.

(The extended cultivation in the Colonies of those marked with * has been recommended by previous witnesses.)

Name.	Use.	Origin.
*Convolvulus scammonia (scammony)	Drug	Levant.
*Urginea maritima (squills)	,,	Mediterranean.
*Astragalus spp. (Tragacanth)	Gum	Levant.
*Chrysanthemum coccineum	Insect powders	Levant.
*Chrysanthemum cinerarifolium	Insect powders	Caucasus.
Coriandrum sativum (coriander)	Drug and condiment	Mediterranean.
*Iris germanica, florida (orris root)	Perfume	North Italy.
*Papaver somniferum (opium)	Drug	Levant, Turkey.
*Olea Europea	Oil	Mediterranean.
*Foeniculum vulgare (fennel)	Drug	,,
*Quillaja saponaria	Drug, soap, &c.	Chili, Peru.
Lavandula vera (lavender)	Perfume	Mediterranean.
*Artemisia maritima (santonin)	Drug	,,
*Hydrastis canadensis	,,	North America.
*Ipomoea purga (jalap)	,,	Mexico.
*Laurus sassafras (sassafras)	Drug, flavour, perfume†	Florida (northwards).
*‡Polygala senega (senega root)	Drug	United States of America.

† "Might have large industrial uses if produced cheaply" (H. E. Evans). *See* note on native plants.
‡ *See* note on native plants.

Name.	Use.	Origin.
(1)*Hæmatoxylon campechianum (hæmotoxylon)	Dye	Central America.
*Carum carui	Spice, drug	Europe and Asia—Cult. Holland.
(2) Madia sativa	Oil	California.
*Krameria triandra (rhutany root)	Astringent	Peru.
*Cascara sagrada	Drug	California.
Capparis spinosa	Condiment	Mediterranean.
Glycyrrhiza glabra (liquorice)	Flavour, tobacco manufacturing.	,,
(1)*Prunus Amygdalus (almond)		Persia, North Africa.
1. var. Amara	Oil, drug	Mediterranean.
2. var. Dulcis	Flavour	,,
*Alkanna tinctoria	Dye	Levant.
*Rosa damascena (attar of roses)	Perfume	Bulgaria.
(3)*Citrus bergamia (bergamot)	Essential oil	Calabria.
*C. vulgaris, risso (bitter orange), oil of Neroli	Perfume, flavour	Mediterranean.
*C. limonum, risso, oil of lemon		,,
*C. vulgaris, risso (sweet orange), oil of orange	Essence de Portugal	,,
*Rosmarinus officinalis (rosemary)	Perfume, drug	,,
Pistacia lentiscus	Resin (mastic)	,,
(4) Rhus coriaria (sumach)	Tanning, dyeing	,,
*Aloe Perryi (socotrine aloes)	Socotrine aloes	Socotra.
(5)*Styrax officinale	Incense	Levant.
*Liquidambar orientalis	Chiefly perfumery	S.W. Asia Minor (India, China, principal markets).
*Hyoscymus niger (henbane)	Drug	Mediterranean.

(1) "Thrives where the olive grows" (Haldane).
(2) Recommended by Haldane for cultivation at the Cape.
(3) "There will be a fortune for anyone who is successful in producing it for use in the Colonies" (E. V. Barrett, p. 25).
(4) *See* note on native plants under Rhus.
(5) Now disappeared from commerce owing to destruction of trees, which, by continued topping, have been reduced to small bushes (Fluckiger, Kew).

II.—*Native Plants yielding Drugs and Perfumes, Dyes, &c.*

A great many native plants are reputed to be of medicinal value. As stated above, the number of plants producing essential oils is remarkable. Andrew Smith in "A Contribution to South African Materia Medica" (published 1888), gives a list of about 200 species which are used by natives and others for medicinal purposes. A number of these are undoubtedly of negligible value; others which possess valuable properties are doubtless omitted from Smith's list. But there are very many which are worthy of careful study. Both their behaviour under cultivation and the nature and action of their products call for investigation.

A few of these plants are already well known, *e.g.*:—

(i) Buchu.—Three species have been in commerce for a long period, viz., *Barosma betulina, B. serratifolia, B. crenulata.* Of these, only one, *B. betulina*, is now in the Pharmacopœia. The market is supplied mainly from wild plants, which are said to be much rarer than formerly, many having been destroyed by collectors as well as by veld fires. Owing to these causes the price has greatly increased.† I am informed (Messrs. Evans, Sons, Lescher and Webb) that the supply in the London market is sufficient in quantity and quality. In America, however, the demand is not satisfied, and there are complaints as to quality. There is, therefore, good reason for getting the plant into cultivation. Experiments conducted by the Forest Department in the Cedarberg Mountains have not yet proved successful. The export in 1912 was 223,021 lbs. of dried leaves, valued at 38,264*l.*

(ii) Berry wax (*Myrica cordifolia*). — Vegetable "wax," resembling in its properties the product of the candleberry myrtle of the U.S.A. Mixed with tallow it makes good candles. Also used locally in soap-making and manufacture of polishes. Some of the South African species grow commonly in loose sand near the sea. Worth investigation.

(iii) *Monsenia ovata.*—Astringent, specific for dysentery. Enquiries for this frequently received from the U.S.A.

In addition there are many plants less well known, which should be investigated. These include:—

(i) Hæmatoxylon (Logwood).—At present the whole supply is yielded by a single species (*Hæmatoxylon campechianum*), a native of Central America, introduced to Jamaica in 1715, and now naturalised there; used by dyers and printers, yielding only the best deep red and black dyes. Also medicinally in use as a mild astringent. Mr. Evans stated in evidence before the Commission (Minutes, p. 315): "At present our supplies come from restricted "areas, and there is a possibility of the tree "being stamped out. It would take many "years to replace."

Hitherto the species named above was the only one of the genus known to exist. A second species is now known to occur in South Africa. This is a bush, growing in very dry places. Its wood yields a dye, which is now being investigated by an expert in England, whose report has not yet been received. Should this be satisfactory, and if the plant responds to cultivation, it may very well give rise to the establishment here of an industry of some importance.

(ii) Rhus.—Various species. *R. lucida, R. tomentora*, and other species locally used for tanning, (*cf.* Mediterranean sumach (*R. coriaria*)).

(iii) *Leonotis Leonurus* and *L. ovata.*—Wild dagga. Reputed to be a remedy for snake-bite.

(iv) *Acocanthera venenata.*—Yields "Brucine," a drug resembling strychnine in many of its properties.

It is hoped shortly to have a large number of these plants, and many others yielding drugs, resins,

† A royalty of 3*s.* per lb. of dried leaves, of *Barosma betulina*, is charged to collectors on Crown lands. (E. V. Holmes, p. 20.)

caoutchous, fibres, dyes, and perfumes, established at Kirstenbosch. In the case of those which yield drugs, their experimental cultivation must be supplemented by pharmacological investigation. This will be rendered possible by the appointment of a pharmacologist on the staff of the local medical school.

III.—*Native Flowering Plants.*

The South African flora, particularly that of the western province, is notable throughout the civilised world for the large proportion of ornamental species which it contains. In the early part of last century these were in great demand in Europe, and a considerable number have since been established as common greenhouse plants. But most of the handsomest of the Cape species are still unknown in cultivation.

The local demand for cut flowers is very large, and has hitherto been very incompletely satisfied by the promiscuous gathering of wild flowers—which has become so extensive that the existence of many of the more attractive species is endangered. There is in South Africa, at present, very little attempt to cultivate the native ornamental plants except in the form in which they have been re-introduced from European nurseries.

There can be no doubt that the application of refined methods of horticulture to the native species in the country of their origin will lead to the rapid improvement of many of the established garden plants, and to the introduction of a great many which are so far known only in the wild state.

IV.—*The Functions of the National Botanic Gardens.*

The recently established National Botanic Gardens have for their main object the experimental study of the native vegetation, including their economic possibilities. Also they will deal with the acclimatisation of a number of exotic economic plants, whose behaviour under South African conditions has not yet been investigated. When properly equipped, they will perform an economic function which has hitherto received comparatively little attention in South Africa. The acclimatisation of exotic plants has been carried on by both the Agricultural and the Forestry Departments as well as by private individuals. Their legitimate efforts in this direction have, however, left a great deal which can only be done effectively by the organisation of a botanic garden. In the circumstances of South Africa the economic investigation of the native flora is certainly of at least equal importance with the acclimatisation of exotic plants. To this practically no attention has yet been given.

The National Botanic Garden was established eight months ago; its objects were numerous. One of the most important of these was the economic work under two heads, namely, the study of South African economic plants which have been very little attended to, and secondly, the investigation of a number of exotic economic plants which have not been seriously tried, most of them not tried at all, in South Africa. I therefore went carefully through the list of plants given you by your first witnesses on drugs and perfumes. I took from this a number of plants, most of which are cultivated in the Mediterranean region, and some in California and in other places in which the climatic conditions are very similar to those which we have here, and I have no doubt that these plants can be established here. I can give you no results at this stage, but I can give you an outline of the experiments which are now being commenced at Kirstenbosch. In the course of the evidence one or two members of the Commission asked the question in regard to the object of botanic gardens, and I added a very brief note on the functions of the South African Botanic Garden.

3665. **(Sir Alfred Bateman.)** Were you ever connected with Kew?—Yes, I was on the staff for four years.

3666. By the way, I see Buchu leaves is a considerable item on this list?—Yes, the purpose of these is medicinal. I am afraid I have not sufficient medical knowledge to say exactly what they are good for. But I believe they are principally used as a diuretic, diaphoretic, and stomachic. They are very much in demand in foreign countries as a medicine. So far as I can tell from my correspondence the demand for this substance is growing very rapidly in North America. The London market is said to be sufficiently stocked, but we are constantly receiving inquiries from America.

3667. Are you in touch with Kew Gardens?—Yes.

3668. Do you ever want the help of the Imperial Institute in London?—I can do very little with these plants here except cultivate them and study their yield. The next step will be to get the assistance of the Imperial Institute to carry on their further examination.

3669. That is quite a new work?—Yes.

3670. **(Mr. Lorimer.)** You have read the evidence given in London as to the desirability of increasing the supply of medicinal plants?—Yes.

3671. Are you making any experiments to test these plants as regards suitability, so far as they are not indigenous to South Africa?—Yes.

3672. Who pays the expense? Do you get a Treasury grant?—Yes. We are just beginning our second year. Our Government grant at present is only 1,000*l.* a year. I can make it up to 2,000*l.* from other sources. But increased grants will be necessary in the near future.

3673. Supposing you could cultivate these plants here, what would you do?—When I get them established and I can show that I can get a sufficient yield and sufficiently good quality I shall take steps to get them taken up privately or hand them over to the experimental farms in the Agricultural Department.

3674. Suppose you found you could cultivate them to good purpose, I suppose you would have no difficulty about labour?—That is one point on which I am not quite sure. I am certain that in some parts of the country there would be no difficulty, but other parts I do not know so well. I have attempted to get information from people who do know and it is rather contradictory.

3675. Much of the labour, I suppose, will be coloured?—All my labour at the Botanical Gardens is coloured.

3676. Supposing you were establishing these cultivations on farms coloured labour would be available, I suppose?—Yes.

3677. There is no limitation to the amount of coloured labour which is available for such purposes, is there?—In some parts of the country there is undoubtedly a limited supply, but in other districts, where the climate is similar to that of Kirstenbosch, there is, as a rule, sufficient labour, I think.

3678. This cultivation could be largely undertaken by women and children, I suppose?—Yes.

3679. And you would probably get sufficient numbers of these?—Yes.

3680. Because we found in Australia, where the climate and soil were both very suitable for the cultivation of many of these plants, the labour was unattainable. It would be too costly, but here, I understand, it would be quite different?—Yes.

3681. I have no doubt that your department would let the London people who require these things know that they were available here?—Yes.

3682. Do you expect to give them definite information on the point before long?—Yes.

Cape Town, Tuesday, 3rd March 1914.

Mr. ALWYN IGNATIUS VINTCENT, J.P., M.L.A., representing the Mossel Bay Chamber of Commerce, called and examined.

(*For the evidence of this witness on "Freights," see p.* 59.)

3683. **(Chairman.)** You represent the Chamber of Commerce at Mossel Bay?—Yes.

3684. The subject on which you are to give evidence, I believe, is the ostrich feather industry?—Yes. The feather industry in the south-western districts is a most important one, and I think the value of feathers shipped through Mossel Bay last year was very nearly 1¼ millions, and the total exports of feathers from South Africa was very nearly 3 millions. At present, unfortunately, the market is very depressed, and I think values to-day, in comparison with what obtained about a year ago, show a reduction of an average of 40 per cent.

3685. Can you give the quotations last year and now?—I have not got those with me. I have no doubt that that information could be obtained from some of the feather buyers here. Personally, I do not buy feathers.

3686. What has been the recent development of the ostrich feather industry?—The quantity is increasing during the last few years throughout South Africa, and a good many irrigation schemes have been undertaken, and, wherever the farmers can go in for it, and wherever the soil was suitable, they grew lucerne and ran ostriches. It has been a very profitable method of farming in the past, and the industry has done a great deal for the development of the country. It has brought in capital. Nothing has contributed towards the development of the country more than the ostrich feather industry. It has sent up the value of land, on the other hand, in some cases to a fictitious figure. Undoubtedly one of the results of this checking of the enterprise will be a considerable reduction in the value of land.

3687. Do you foresee a large extension of the production of feathers in South Africa?—Of course, it all depends on the future prices of feathers. I do not think the increased quantity of birds is so much a factor in the recent slump as the change in fashion. The prime feathers are not worn now as much as formerly, and some of the cheaper stuff has improved in value while there has been a drop in the better class of feather

3688 Is there not a large increase of land devoted to ostrich feather farming, and is the slump not due to that?—The area is being increased by irrigation in the south-western districts, where you have rich alluvial land. The values of land have gone as high as 200*l.* an acre. Of course, at those prices, farming could only be remunerative as long as the feathers maintained a fair value, but if a man had a farm to-day on land for which he paid 100*l.* a morgen, at present prices it would not be a paying proposition. The profitable nature of the farming has induced the farmers to give their whole attention to ostriches. They have put all their eggs into one basket, so to speak, and I think if there were a permanent slump, the farmers would devote attention to other systems of farming, and the lucerne land would do for dairy farming and the fattening of cattle, &c.

3689. The land which fetches such high prices for ostrich-farming has peculiar characteristics?—Yes; it is a great depth, and, in a district like Oudtshoorn, if they irrigate the land three times a year, they find it suffices.

3690. Does the depth of the soil affect the quality of the feather?—No; the depth of soil retains the moisture, and lucerne grows much better. In the case of winter feed they give harder food, such as maize.

3691. If you have poor land—or rather less good land—irrigated, is that better than good land not irrigated?—Yes.

3692. With regard to irrigation and the extension of it, as applied to ostrich-farming, is there a great future for it?—I think so. Hitherto, of course, in the south-western districts most of the schemes have been private schemes undertaken privately by farmers. In the Oudtshoorn District a considerable scheme is being undertaken by an irrigation board. Farmers combine and borrow money from the Government at 3¾ per cent., and then they pay interest plus sinking fund, and it is redeemed in thirty to forty years, so the farmer contributes to the cost of the supply of water in proportion to the area irrigated.

3693. Do these schemes work well?—Yes. They form a board and pay towards the interest and sinking fund.

3694. Supposing that an adequate market and adequate prices existed, there is no reason why the ostrich-farming industry should not extend very rapidly and largely?—It is extending throughout the Union at the present time. There was a time when the Cape ostriches had practically a monopoly, but now Natal is running birds with success, and I understand the Transvaal and the Free State also.

3695. What constitutes the advantage of South Africa in regard to ostriches compared with other countries?—Well, South Africa was the home of the bird, and we have a law prohibiting the export of ostriches.

3696. Do other countries compete at all with you?—Not materially. Egypt ships feathers, but they are of poor quality, and I think in California they have some birds, but not on a very large scale.

3697. What is the price of birds?—They vary. You can get some rubbish for 2*l.* or 3*l.* The price of the birds naturally fluctuates with the price of the feathers.

3698. The best birds are worth what?—I have not heard of recent sales, but there was a time when they paid as much as 500*l.* for a pair of breeding ostriches. You can obtain very good birds now for 100*l.* the pair. Even in the last few years farmers who had good breeding birds sold their chicks at 5*l.* a week old.

3699. **(Mr. Campbell.)** There has been a considerable decline in the market value of feathers during the last two or three years?—Yes: this last year very considerably. Up to this last year the farmers were getting very remunerative prices. As regards the price to-day, compared to a year ago, I am informed by those in the business that it amounts to an average decline of 40 per cent. In other words, supposing that a year ago the value of feathers exported was, say, 2½ millions, it would mean a decline of 1 million on to-day's prices.

3700. Is that decline due to fashion or to the increasing supply of feathers?—I think more to the change in fashion than to the increasing quantity.

3701. Do you think the increase in the production of South Africa has had a serious effect on the market?—I do not think the increase has been very serious but I think it is due more to the change in fashion.

3702. Is there any prospect that there will be serious over-production if the industry is extended in this country?—Of course, if feathers are not fashionable then, naturally, the increase in quantity would tend to further depress the market. That, of course, applies to all articles of commerce.

3703. Looking at it from that point of view—supply and demand—is there room for a very great extension of the industry?—I do not think so. I do not think it would be wise for farmers to rely too much on ostrich feathers. I think the time has arrived when the farmers should seriously consider the question of

going in for mixed farming instead of depending on ostriches entirely.

3704. Is ostrich-farming mixed with other classes of agriculture?—Yes, in some cases. Of course, in Oudtshoorn the land is so dear and so high in value, and most of the land is situated in valleys which are narrow, and wherever they have been able to irrigate no other class of farming has really paid.

3705. What would be the price of land in Oudtshoorn that is used for ostrich-farming—100*l.* an acre?—Well, I should say within the last few years the average value of good irrigable land sold there has been 250*l.* a morgen—that is a little over two acres. And some pieces—more particularly small lots contiguous to large holders and wealthy men—have been sold at prices as high as 500*l.* a morgen. You see you have some wealthy farmers there who show a big surplus every year, and their hobby is the acquisition of land, and they have been known to pay occasionally as much as 500*l.* a morgen for a bit of land adjoining their own which they were determined to have.

3706. What number of ostriches would be kept on land of that value?—I think they estimate about six ostriches to a morgen.

3707. And the birds return now about 3*l.* a plucking, do they not?—I suppose at the present time that would be about the average, say, about 4*l.* 10*s.* a year, because they pluck every eight months.

3708. Are the feathers all prepared here before sending away, or are they shipped in a raw condition?—They are simply bundled together and not dressed.

3709. Is there any possibility of acclimatising an industry for the dressing of ostrich feathers?—I do not think there is any idea of doing so. I believe in America, for instance, where a lot of the feathers go, there is a higher duty on dressed feathers than on undressed, so you would be penalised in the market.

3710. Is the industry one that is subject to serious changes in fashion?—Yes. The feather has been in fashion now for a good many years, but it is an article on which the price has fluctuated a good deal.

3711. Ladies do not regard ostrich feathers as they do diamonds—a joy for ever?—Well, you see, diamonds last longer. Feathers wear out, and that is a good thing for the feather-grower.

3712. **(Mr. Sinclair.)** I suppose that the margin of profit which the farmer has been getting during recent years has been so large that there has been room for a considerable fall in price and yet to leave him a fair result?—Yes; twenty years ago the prices were also very low, but land was cheap.

3713. I suppose the profitable nature of ostrich-farming has had some effect on the price of land, like the dairying industry in other countries?—Yes.

3714. And as the value of feathers comes to be permanently reduced, so land will undergo a depression in value?—Yes.

3715. Unless the land is of sufficient richness to produce other equally profitable crops?—Yes.

3716. And I take it that land used in ostrich-farming is capable of producing anything?—Yes. I have heard from practical farmers whose opinions are of value that unless there is a very serious slump, affecting the stability of the country generally, that irrigable land in Oudtshoorn will never go below 200*l.* a morgen.

3717. It is intrinsically valuable and productive?—Yes.

3718. I suppose that there is little doubt that the farmer himself will change his crops as he finds there is a demand?—Yes.

3719. Do I understand from you that it is your opinion that other countries where ostrich-farming can be carried on would not be able to produce as good a feather as is produced here, by reason of the fact that those comtries are not the home of the ostrich?—I do not see why they should not produce a good feather in Australia.

3720. We had an opinion the other day from a witness that, even given your bird in Australia, he did not think that the same feather could be looked for?—I am not sufficiently expert, I am afraid, to express an opinion on that. I do not know Australia at all or the conditions there. My opinion on that question would not be a very valuable one, I am afraid.

3721. **(Sir Jan Langerman.)** You spoke of mixed farming. Taking the average value of land, you think it is about 100*l.* an acre?—Yes.

3722. In Oudtshoorn particularly, supposing they went in for mixed farming, what other class of farming could they carry on with land at 100*l.* an acre?—Suppose they grew lucerne, I am told that if they could get 2*l.* 10*s.* a ton it would pay them well.

3723. Do you mean for export?—Yes, and for use in the country.

3724. And what about tobacco?—That is a valuable crop, of course, provided they grow the right quality, it pays very well.

3725. And Oudtshoorn is also good for fruit?—Yes, but since they have applied themselves almost exclusively to ostrich-farming they have neglected the small details, such as dairying and fruit.

3726. So the average value of land, 100*l.* an acre, where there are ostriches and lucerne, you would not consider too high?—I would not consider it to be a dangerous level.

3727. **(Mr. Tatlow.)** How long have you been interested in ostrich-farming?—I am not directly interested personally.

3728. You have taken an interest in the industry?—Yes. I have been in business myself for thirty years in Mossel Bay. Of course, thirty years ago the value of exports was much smaller.

3729. In that period of time have you ever known ostrich feathers to go out of fashion?—They have never been unsaleable.

3730. Has there ever been a serious slump owing to change of fashion?—Yes, twenty years ago they were quite as low as they are to-day, and then at the lower prices the farmers made money.

3731. At present prices ostrich-farming is profitable?—Yes.

3732. You said about four years ago the price was considerably higher?—Up to July last year prices were good, and then the market sagged. I take it you have the statistics of shipments during 1913?

3733. No, not yet.—Take 1913. Very heavy losses must have been sustained by shippers on parcels from September onwards for the December and February sales.

3734. Is there a greater demand for the inferior feathers than formerly?—Yes. Recently, the commoner stuff in proportion has sold very much better than the primes.

3735. Because the lower classes are dressing better?—Yes, one has to remember that.

3736. You are rather looking towards that as a permanent demand, I suppose?—Yes, I do not think it will ever go entirely out of fashion. You see a great number of people are employed and interested in the industry in Europe and elsewhere, and a lot of money is invested in it, and these classes are not going to let the thing lapse.

3737. On this good land how many crops of lucerne can be grown?—About five a year.

3738. **(Sir Alfred Bateman.)** I suppose at Port Elizabeth we shall get returns of prices?—Yes, you have some large dealers there. At Mossel Bay there are very few dealers.

3739. The sales are mostly made in the ostrich feather market at Port Elizabeth, are they not?—Yes. At Oudtshoorn they have no public market. They have private buyers there who visit the farms or get the farmer to bring in his plucking and invite tenders for the feathers.

3740. At Port Elizabeth they have sales almost every day?—I think, weekly.

3741. And the feathers are sorted there?—Yes.

3742. But not dressed?—No.

3743. I think that you told us that the United States tariff gave considerable advantage to the undressed feather?—Yes.

3744. And I think it is the same in other countries—notably in Germany?—Yes.

3745. Can you tell us whether you consider the soil or climate here has any effect on the feathers as well

as the lucerne. Has it an effect on the ostrich?—I think the ostrich likes a dry heat, and that is what he gets on the Karroo.

3746. What you say gives us the idea that for the future the market will be larger for the rather inferior feather—there will be more market among the working classes?—Well, if the upper classes resume wearing the plumes it will naturally affect the price.

3747. Is there much demand from the coloured classes in this country for the decoration of themselves and their women?—Not to a large extent. As you will see, if you walk about Capetown, many of the coloured women wear feathers. It does not affect the market much. Natives, of course, do not wear them, but the Cape coloured people do. The coloured classes here get good wages—practically the same as your white people in England, and they devote a large percentage of their wages to dress.

Cape Town, Thursday, 5th March 1914.

Mr. FRANK BRAYBROOKE SMITH, Secretary of the Department of Agriculture for the Union of South Africa, called and examined.

(*For the evidence of this witness on "Land Settlement," "Cotton," and "Fruit," see pp.* 9, 274, *and* 318.)

3748. **(Chairman.)** How long have you occupied your present post?—I was appointed Director of Agriculture in the Transvaal in 1902 and at Union was made Secretary of Agriculture for the Union.

3749. You have been good enough to furnish the Commission with a letter on the subject of the working of your department. (*Letter put in as follows :—*)

Department of Agriculture,
Capetown.

SIR,

IN accordance with the promise I made to you I have the honour to furnish the following brief notes on the points mentioned by you :—

The Union Department of Agriculture.—The duties of the Department of Agriculture are confined to the assistance of the agricultural industry, and its chief functions are—

(1) To protect the live stock and crops of the farmers from diseases.
(2) To conduct research with a view to devise methods of reducing the risks and expenses of farming and increasing the returns from it.
(3) To educate the farmers.
(4) To organise the farmers and assist them in obtaining markets for their produce.

The Forestry Department, which is included in the portfolio of the Minister of Agriculture, deals with forestry and the fixing of drift sands.

The Lands Department has charge of the Crown lands, and deals with land settlement; and the Irrigation Department, which is included in the portfolio of the Minister of Land, has charge of irrigation and the obtaining and conservation of water generally, and of meteorology.

The Land Bank grants loans to co-operative societies and to farmers, both voluntary and involuntary, *i.e.*, loans applied for by the farmers on their own initiative and loans on account of expenditure necessitated by the obligatory erection of dipping tanks for cattle or sheep, or of fencing, under the Stock Diseases or Fencing Acts. As was the old Transvaal Department, the Union Department has been framed on much the same lines as the U.S.A. Department at Washington, and I should here like to acknowledge our very great obligation to that department for advice, for obtaining officials for us from time to time, and for their publications.

In organising the Department of Agriculture the aim has been to entrust each branch of its work to specialists, and to allow them to concentrate their whole attention thereon. The divisions of the department and of the expenditure thereon last year were as follows :—

	£
Administration, including grants in aid to agricultural societies.	49,599
Veterinary (control of contagious diseases).	117,982
Veterinary research	57,593
Sheep—eradication of scab and improvement of sheep and wool.	101,314
Dairying	6,554
Botany	7,076
Tobacco and cotton	14,820
Horticulture (including inspection of fruit).	4,348
Viticulture	4,309
Entomology	17,620
Chemistry (partly undertaken by the laboratories of the Department of Interior).	1,641
Publications	4,173
Co-operation	3,439
Dry farming	5,036
Guano Islands	5,036
Grain inspection	3,777
Field cornets (shortly to be transferred to Department of Justice).	24,755
	£478,566

Services rendered by other departments, such as Public Works, Printing, Post Office, &c., are not included in the above, nor has the revenue, which in some cases, such as the Guano Islands, is considerable, been deducted. Full details of the receipt and expenditure and personnel of the department are given in the estimates of expenditure and in the report of the Department of Agriculture and of Agricultural Education and at the end of the "Agricultural Journal."

Agricultural education, though an integral portion of the Agricultural Department, is provided for in a separate vote. There are four large and well equipped agricultural schools or colleges and experiment stations, and a fifth is in progress of establishment. The fees charged at the schools are 50*l.* per annum and a number of bursaries are given for students in poor circumstances. There are at present 215 students at the schools. In addition to complete courses the schools held short courses for farmers, and the staffs of the schools and of the department deliver lectures at farmers' meetings, act as judges at agricultural shows, and visit farmers on their farms in order to advise them. The vote for Agricultural Education this year is 115,357*l.*, and the amount of travelling undertaken by the itinerant instructors and inspectors of the department may be gauged by the fact that no less than 45,000*l.* was spent on travelling last year.

The provision for scientific research and itinerant instruction is still insufficient and will have to be increased.

The obtaining of officers for the department has been a great difficulty, and without the assistance we have obtained from U.S.A. and Canada, I do not know what we should have done. I am glad to say Great Britain is now waking up, and more attention is being devoted to the training of men for agricultural education and research. At the present time scholarships have been granted to about 30 young men for four years to study different branches of the science and art of agriculture in England, America, and elsewhere.

In addition to the assistance rendered to farmers by the Agricultural Department, the Lands Department disposes of Crown lands at reasonable rates and on easy terms and it also advances up to four-fifths of the value of farms bought by farmers under certain conditions.

The Land Bank advances money to farmers at a reasonable rate of interest, and where farmers are compelled by law to erect dipping tanks for cattle and sheep on farms the law provides that the cost of the same shall be advanced by the bank and be a first charge on the holding until paid off.

The Irrigation Department advises farmers in the obtaining, conservation, and utilisation of water and how to bore for water at reasonable rates.

The Forestry Department advises farmers in the planting of trees and sells trees to them at low rates.

The railway rates are very favourable to farmers: for instance, there is a flat rate of 10s. per ton for mealies all over the Union and rates for South African produce, fruit, and artificial manures are correspondingly low.

The agricultural parcel post is very reasonable, parcels not exceeding 11 lbs. in weight being carried for 1s.

Under the new mail contract pure-bred stock for breeding purposes, with the exception of rare horse mares, are carried free from Europe. Since the date on which the contract came into operation (October 1912) 300 horses, 1,390 cattle, 100 pigs, and 250 sheep have been imported under it; the reason why the sheep are so few is that the majority of the sheep imported into South Africa are merino sheep from Australia.

Under the mail contract the following rates are charged from any port in South Africa to London and certain other British and Continental ports:—Maize, 10s. per ton; fruit, 40s. per ton in cold storage if passed by Government grader and 50s. per ton if not graded; citrus fruit and pine apples in ventilated hold 25s. per ton; though there is no export of butter and meat at present, provision has been made in the contract for the same.

The Custom tariff is also favourable to the farmers; livestock for breeding purposes, artificial manures, grain bags and seeds (with the exception of potatoes) are admitted free, and agricultural machinery and implements and fencing material are charged a duty of 3 per cent.

The following figures extracted from the last census report may be of interest to the Commission:—

Population of Union.	European.	Other.
1904 - - -	1,116,806	4,059,018
1911 - - -	1,276,242	4,697,152

Number of European Farmers.

1904 - - -	77,926
1911 - - -	97,381

Livestock.

——	Cattle.	Horses.	Mules.	Asses.	Sheep.		Goats.		Pigs.	Ostriches.
					(Woolled).	Other.	(Angora).	Other.		
1904 - -	3,500,453	119,539	134,734	141,930	11,820,635	4,501,868	9,770,545		679,084	360,830
1911 - -	5,796,949	719,411	93,931	336,710	21,842,215	8,814,444	4,275,335	7,487,644	1,081,600	746,736

The following figures are taken from the Customs Statistical Register:—

——	1907.	1912.
Value of Importations into the Union.		
	£	£
Butter - - - - - -	404,730	318,530
Corn and grain (including malt).	998,453	560,409
Flour and meal - - -	610,343	498,717
Eggs - - - - - -	70,243	67,753
Dried fruit and dates - -	76,104	76,034
Fruit, fresh (including nuts) -	60,648	74,829
Bacon and ham and salted meats.	224,256	225,775
Milk and cream - - -	422,266	424,460
Value of Exports from the Union.		
Wool - - - - - -	3,128,957	4,780,594
Angora hair - - - -	965,687	967,286
Hides and skins - - -	947,649	1,691,014
Ostrich feathers - - -	1,814,232	2,609,638
Maize - - - - -	184,346	443,492
Fruit, fresh - - - -	23,812	54,735
Total produce of land -	7,363,322	11,163,506

Unfortunately, there are no figures to show the increase in land under cultivation, but it is evidently considerable.

South Africa has an unenviable, but, unfortunately, justly deserved, notoriety for the variety and virulence of its diseases of animals and plants, for it is probable there is no country in the world more afflicted with the ordinary contagious diseases and with obscure epizootic diseases than it. The common contagious diseases of live-stock are rapidly being exterminated or got under control, and preventives or remedies are being discovered for many of the epizootic diseases. The Veterinary Research Station, Pretoria, is one of the best of its kind in the world, and the Plant Pathological and Entomological Laboratory are also good, and thanks to the more effective control of disease, to the discoveries that have been made, and to the introduction of the dipping of cattle and the increase in fencing, farming has already become a much less risky occupation than formerly.

The losses from drought and hail, to which the greater portion of the country is very liable, are considerable, but by the conservation of water, improved methods of cultivation, and the distribution of crops they can be greatly reduced. Though the risks of farming are considerable, the returns on the average are good and in some cases high, and during the last few years the farmers have prospered and land has increased rapidly in value.

You specially asked for information respecting co-operation and the export of maize, and for my remarks on the evidence given in London on the Plant Disease Regulations. There is no co-operative Act for the Union, but there are Acts in the Transvaal and in the Orange Free State. Full particulars of the work will be found on pages 22 and 317 of the report of the department for last year, and particulars of the export of maize will be found on pages 26 and 259 of the same report. The membership of the 20 co-operative societies in the Transvaal last year was 11,558 and their turnover 794,921*l*. With respect to the Plant Disease Regulations I think it will not

be possible to substitute inspection in another country for inspection here, nor do I think it would be possible for all the British Colonies to formulate regulations identical in every particular, as their circumstances differ, but as our knowledge of plant diseases increases the tendency is for regulations to become more uniform and stricter. It is recognised that inspection is only a partial safeguard, and in respect of plants—a portion of plants—that are particularly liable to convey dangerous diseases, the tendency is to exclude them altogether; for instance, the United States of America has recently prohibited the importation of potatoes from Great Britain and for some time Great Britain has prohibited the importation of live-stock from any country. It should be remembered that diseases which may not be very troublesome in a temperate country like Great Britain may be very dangerous in a very warm country like this. There is one point I should like to make in connection with quarantine stations, and that is that the English Board of Agriculture should hurry up with the quarantine station for the testing of cattle for tuberculosis prior to export. This would be a great boon and is badly required. The chief agricultural produce we have to dispose of at the present time are wool, mohair, ostrich feathers, fruit, maize, tobacco, wattle bark, possibly wine, and any assistance which the Commission could give us to obtain good markets for them would be greatly appreciated.

I have not discussed land settlement, as that subject is dealt with by the Lands Department.

I have, &c.,

F. B. Smith.

Secretary for Agriculture.

The Secretary,

Dominions Royal Commission.

3749A. **(Chairman.)** Perhaps you would like to supplement that statement, or would you prefer to answer questions?—I have one or two remarks I would like to make. I did not make myself quite clear with regard to the regulations for the export of plants and so on from Great Britain to the Colonies. I want the Commission to understand that uniform regulations would necessitate uniform legislation in the whole of the Colonies. I gather that the Commission are in favour of regulations being drafted by the English Board of Agriculture in the first instance and submitted to the Colonies, but I would like to point out that that would not meet the case because legislation is also involved, and one would have to have uniform legislation in order to pass uniform regulations, and then, again, I notice there was a long discussion between Mr. Rodgers, I think it was, and one of the Commissioners, the late Sir Richard Solomon, about the regulations in the Colonies and about not being advised of alterations to these regulations. As a matter of fact in the first instance the regulations appear in the Government Gazette invariably some time before they are put into force, and the Gazettes are sent to the High Commissioner's office in London and probably to the Colonial Office, so there should be ample time to gather any changes in the regulations from the Government Gazettes. In the discussions they seem to have overlooked this point entirely.

3750. Is there anything else which you desire to add?—No.

3751. I will ask you a few questions based on your letter. You say the duties of the Department of Agriculture are confined to the assistance of the agricultural industry, and the first of its chief functions is to protect live-stock and crops of farmers from disease?—Yes.

3752. We all know that South Africa is particularly liable to severe pests. What progress has been made in protecting the country?—We have made excellent progress in protecting the country from what may be termed the ordinary contagious diseases. In the first instance we inspect all animals coming into the country and in that way we have managed to keep out any fresh contagious diseases. We have also controlled the ordinary contagious diseases in the country and by quarantine and slaughtering of the animals we have stamped out most of these diseases. There is no foot and mouth disease, there is no rinderpest, and hardly any lymphangitis and very little lung sickness, which used to be a great curse to the country. All these have been practically eradicated and we are in a fair way to eradicating glanders and all the ordinary contagious diseases with the exception of scab and tuberculosis, which are still giving us trouble. In regard to epizootic diseases of animals, with which, I suppose, we have been scourged more than any other country in the world, we have also made great progress. We had first of all to investigate those diseases to determine what they were and then to devise methods of dealing with them. At Pretoria we have a first class laboratory for dealing with stock diseases common in warm countries, under Sir Arnold Theiler. It costs us about 40,000*l.* to 50,000*l.* a year to maintain, and it is probably the best and most complete of its kind in the world. One by one we are discovering the nature of the various diseases and getting remedies or preventives for them, so that we are rendering it possible for farmers to keep their cattle alive and to protect themselves from losses under this head which they have hitherto sustained. We have not overcome these difficulties entirely, but in regard to disease generally we are on a very different footing to Canada, Australia, and most of the other Colonies, which have few, if any, enzoic diseases. We are connected with the Old World, and our diseases have come mainly from the hot-bed of diseases, Asia, and worked down through Egypt to the southern part of the Continent. This is an unfortunate country in that respect, because these diseases seem to have become concentrated here. Still, the position is very different to what it was some few years ago, and the future is full of hope.

3753. Now, eliminating the extra risk of diseases or these pests to which you refer, is the country highly suitable for rearing cattle?—The country is a good cattle country; given water the stock do well.

3754. Then, with a suitable climate and suitable soil and with freedom from these pests and diseases, you think there is great hope for the future?—Yes.

3755. Do you find farmers and the population generally ready to adopt scientific ideas and to follow out scientific regulations?—We find the farmers in South Africa are less conservative than farmers in Europe. The farmer here has not got into settled ways. His practice is not developed to the same extent as in Europe. In Europe, practice has developed so well through long centuries that it takes a great deal to get the farmer to alter his ways, and as a matter of fact he often knows more than his advisers can tell him, because his practice, based upon centuries of experience, is worth a great deal of theory; but here farmers have not had all those centuries of practical experience in tilling the soil that farmers in Europe have had. The population here, so far, with the exception of the Western Province, has been a shifting one, and, therefore, they have not that intimate acquaintance with the different soils and the different conditions which is possessed by the farmer in Europe, and they are more inclined to listen to advice than the farmer over there. It is easier to lecture to them.

3756. You find them amenable to the Agricultural Department?—Yes, on the whole. Of course, you have the Kaffirs to consider, they want a lot of watching. If you have a strong body of officers to watch them they are all right, but they do not understand the reason for the regulations for the control of disease unless those reasons are brought home to them by very painful experience. When they have lost half their cattle by East Coast fever and they see that dipping will save them, they will obey our instructions, but in the first instance, when the disease is beginning to spread, which is, of course, the most critical time, you have great difficulty in dealing with them.

3757. The second of your functions is to conduct research with a view to devising methods of increasing the returns of farm produce?—Yes.

3758. I understand you have a large research department at Pretoria?—Yes.

3759. Is that in close touch with similar institutions in the Mother Country and in the Colonies?—We get all their literature, we are in close touch with the Agricultural Department at Washington; we have had far and away more assistance from the people at Washington, I think, as regards experience and information than from anywhere else. From Canada we have had a great amount of help also, and we have sent many of our young men as students to Guelph, and they have come back to this country and have been a great help; we have also had several Canadians in the agricultural service here.

3760. Have you had much help from the Mother Country?—In the first instance practically none, but during the last few years they have roused themselves more in England and we have had some assistance of late from Cambridge and elsewhere, but we do not get the same class of assistance as from the United States. We have sent some of our students also to Australia and they have gained a great deal of valuable knowledge, particularly from the Hawkesbury College and the Sydney Technical Institute.

3761. Is the inferiority of the assistance you gain from England due to inherent conditions or to bad organisation or lack of co-ordination?—It was partly due, undoubtedly, to different conditions, it was more largely due to the fact that in England the Board of Agriculture until recently was practically an executive body. It was staffed largely by laymen, its different divisions were controlled by laymen, and they did not set out to help farmers or to conduct research in the same way as they do in Canada and the United States; but lately they have roused themselves a very great deal and are taking a very great interest. Our Chief Veterinary Surgeon went to England to become Chief Veterinary Surgeon there, and he has done a great deal to bring about a better state of affairs.

3762. Are you in close correspondence with the Imperial Institute?—Yes, I know Professor Dunstan well and I am in correspondence with him.

3763. Are they able to give you any assistance?—Yes, in this way, for instance, if we want a good account of cotton, or wattle bark as a tanning material, they help us a good deal and furnish most valuable reports.

3764. And Kew Gardens?—They have not been able to do much because they do not quite take up the lines of economic botany that we want.

3765. Can you suggest any means by which the assistance rendered by the Imperial Institute could be developed?—I do not know that I could, I think they do as much for us as they can; I do not think they can do more.

3766. Your third function is to educate farmers?—Yes.

3767. How do you do that?—We have in various parts of the Union five agricultural colleges, the most complete is at Potchefstroom, where we have a farm of 2,500 acres. There we have large quantities of first class stock and large quantities of land under cultivation. We give the student a first class training in practical agriculture and a fairly good training in the science of agriculture. At the college they also conduct experiments and farmers can go there and see the experiments for themselves. Besides that there are itinerant inspectors who travel through different areas and lecture to the farmers.

3768. Where are those colleges?—There is one at Potchefstroom, about three hours' journey from Johannesburg, which I sincerely hope the Commission will be able to visit. In addition to showing what we have in the way of a first-class college it also shows what the country can produce, because the college was established on a bare piece of land less than eleven years ago and now you will see a flourishing farm of about 2,500 acres with splendid crops and stock.

3769. What is the duration of the course at that college?—Two years.

3770. In Australia we found that there was a growing demand for men who have gone through a short agricultural course as opposed to an extended one?—We are just establishing short courses here; we had about 70 students last year at Potchefstroom for two months. They were highly technical courses. We dealt with the "how" rather than the "why."

3771. Shall we say that they were more practical?—Yes.

3772. Do you think you will be able to develop that system?—Yes, and to develop the system of itinerant inspection.

3773. Your itinerant inspectors exercise their functions in what way?—They travel amongst the farmers. For instance, we have wool and sheep experts who lecture on the preparation of wool for market, the grading and sorting of sheep, and judge at agricultural shows. They visit farmers, advising them as to the suitability of their farms for sheep and how to manage them, and what type of sheep would best suit the farm. The dairy expert does much the same kind of work in regard to milk, butter, and cheese, and the horticulturist goes round advising as to the suitability of trees and about the packing of fruit.

3774. What about instruction for new arrivals in the country. Do they have any special course?—We always advise them to go to one of the colleges for a couple of years; it takes fully that time for a man to get acquainted with the country, and we keep them there for the mere cost of their board. We only charge 50*l.*, and they cannot live cheaper. After a man has been there for a month or two, unfortunately, he wants to start farming for himself, and we have great difficulty in persuading young men to obtain practical experience before commencing to farm on their own account. They usually lose money and become disheartened.

3775. If two years is too long is there any possibility of a shorter course?—Well, it is a short apprenticeship for an occupation like farming. In England, we are told, it takes twelve years to make a competent agricultural labourer. If that is so, these men who have to do all the work themselves, and also to teach the Kaffir, cannot very well get much benefit in less than two years. If I had a son I should not like him to commence farming with 1,000*l.* or 2,000*l.* after only two years' experience.

3776. Now, your fourth function is to organise the farmers and assist them in obtaining markets for their produce. In what way do you do that?—In the Transvaal and the Free State we have good co-operative Acts, we have organised there co-operative societies. Before Union the Free State did a great deal in organising co-operative dairies, and we are continually in touch with them, giving them advice and assistance, also with the co-operative tobacco societies, and through the Trades Commissioner in London we keep a close watch on the markets in England and Europe, and publish accounts of the prices which are being realised for fruit and other produce. The Trades Commissioner sends an annual report and also a weekly report, which gives information on the condition of the produce which we send home, and the price it realises, &c.

3777. Do you find the farming community ready to adopt co-operation?—There is no trouble in getting them to adopt it, the trouble is to keep the societies up to the mark. When societies have been established it often happens that all goes well for a time, but then the directors begin to get slack and the secretary is left to manage the thing himself. Of course, if he is a good man all goes well, but if he is the reverse there is trouble. Under the Act every individual member is liable for the whole liability of the society, but even that does not make them careful at times.

3778. The Government, I think, have had great success in organising irrigation works on co-operative lines?—Yes, and also for fencing and dairying, and the export of mealies. Our co-operative societies in the Transvaal had a turnover last year of about three-quarters of a million, which, for societies only formed a few years ago, is a good beginning.

3779. Are they developing?—Slowly. We do not want them to go too fast or they may go wrong.

3780. What can you say with regard to the cultivation of tobacco. I think some attempt has been made to introduce Turkish tobacco?—Yes, that has been

tried in the Western Province, and I think tobacco and citrus fruit will do particularly well in South Africa.

3781. You consider those two of the most promising crops?—Yes, next to mealies and the ordinary farm crops.

3782. Is your soil suitable for the production of high-quality tobacco?—Yes. It is good for Virginian tobacco, and in the lower-lying and warmer valleys it is good for Turkish tobacco.

3783. You state in your memorandum that railway rates are very favourable to farmers. There is a flat rate of 10*s.* a ton for mealies all over the Union?—Yes.

3784. What do you say regarding the possibilities of mealie cultivation?—Very good. Mealies is the chief crop.

3785. Do you see a large increase in this direction?—There will be a large increase. I am not prepared to say there will be a large export, because I think the tendency will be to consume it in the country in feeding the stock.

3786. Taking the whole question of agriculture and South African exports at the present time, the major portion of South African exports, I understand, are mining products?—Yes.

3787. Now in the event of that falling off, in what direction do you say that South Africa can supply its place from agriculture?—We shall develop along the lines on which we are going. Our exports are certainly not very much at present; I think about twelve million pounds of agricultural produce.

3788. As compared with fifty million pounds of minerals?—Yes, roughly. But at any rate in the last five years our exports have doubled, and you will see from the census figures that the stock in the country is increasing enormously, so that we shall soon, I hope, be able to improve our export figures very much.

3789. Therefore, your reply is that you see no special development in any one direction, but you hope for general development?—Yes.

3790. Now you have been good enough to give us a comparison of the live-stock, sheep, pigs, and so forth, in 1904 and 1911. 1904 was perhaps rather a low level to start from?—Yes, because in 1902 there was no stock in the Free State or the Transvaal, practically nothing. There were a few old and diseased horses left over from the war, and that was about all.

3791. How would these figures for 1911 compare with a normal year before the war, say, 1898 and 1899?—I should doubt whether we have got back to the quantity of stock that we had in the Transvaal before the war.

3792. And in the Cape?—I should say we have just about reached that level.

3793. Can you give the Commission any figures?—There were none for the Transvaal or Free State before the war, and I doubt whether there were any for the Cape.

3794. You have not got back to the number of live stock that you had before the war?—No, not quite.

3795. And when you reach that level do you anticipate a very considerable and rapid progress?—Yes, I think so, because the land to-day is being farmed so much better, and the tendency is to paddock farms off and to supplement the natural veldt by silage and different foods from the arable land, so the amount of stock should be much greater.

3796. You consider that, unfortunately, there are no figures to show the increase of land under cultivation, but that this increase is evidently considerable. In future will you have such figures?—Yes, at the last census they took account of the area of land under cultivation, but at the census of 1904 this was not done; from now on we shall have figures.

3797. Are those figures accurate?—I should say moderately accurate, because the farms are so large, and the areas cultivated are so very irregular in shape, that the farmer can only give a rough guess of their extent.

3798. You give the total produce in 1907 as seven millions, and in 1912 eleven millions. What do you mean by the total produce of the land?—I mean the total produce exported.

3799. I see the amount of mealies has decreased?—Yes, but that, to a certain extent, is a good sign, because it shows they were used locally for fattening the stock.

3800. Has the special rate for the export of maize both on the railways and oversea proved of very great value to the country?—Yes. When the maize export was begun, arrangements were made whereby a farmer could take his maize to the station and get it sent straight away to London, and, if necessary, sold by the High Commissioner for 2*s.* 6*d.* a bag. That was a very reasonable rate, the sea rate was 10*s.* and the railway rate was 10*s.* and incidentals 5*s.* per ton; the effect of that was that the farmers at once realised there was no chance of a glut in mealies; before that enough mealies were never grown in the country because the farmers were afraid that the mines could not take them all, but after they had this channel open to them, so had no such fear. Further, they dealt straight at the railway station, or with the merchant at the port, or with the co-operative society inland, instead of with the local storekeeper.

3801. Well, that has been curtailed by the exceptionally bad seasons during the last three or four years, I understand?—The decrease in the export of maize is due partly to bad seasons, but also to the increased consumption in feeding stock. In the old days farmers never dreamed of feeding stock with maize, now they are doing it very largely.

3802. Is that desirable?—Yes, it helps the animals in times of drought, and helps in the production of milk.

3803. So the decrease in the export of maize is not entirely due to drought?—No, I think it is a good sign in one sense, because it shows better farming.

3804. **(Mr. Campbell.)** With regard to the export of maize and the apparent decrease, is it not due to the fact that in the years 1909 and 1910 there was a very large over-export of maize from this country, and a large amount of it had to be re-imported?—No, very little, I think; about from 40,000 to 50,000 bags had to come back.

3805. Well, there was an over-export?—Yes, but if maize makes a very high price in one part of the year, farmers are tempted to sell.

3806. One witness said that maize was sold in England or some other country at a cheaper rate than in South Africa. Is that so? He suggested that there was some combination of sellers here which kept the price up?—No, I do not think so; the only combination of sellers that I know of is the Central Co-operative Agency in the Transvaal. There is a central agency in Johannesburg which focuses all the maize belonging to the affiliated societies, and enters into contracts with the mines. Probably this year they will make contracts for 200,000 or 300,000 bags at a fixed price, but I do not think there is any other big combine.

3807. Is the Transvaal the greatest producer of maize?—It depends on the season. It may be the Transvaal or it may be the Free State, it depends which gets the best season.

3808. I suppose there is still a fairly large export of maize?—About 400,000*l.* last year, I think. At present quite a lot of mealies are going away.

3809. So that these concessions given by the railways and the shipping company have been of great assistance?—Yes.

3810. With regard to the agricultural schools and their work. Do you find that the students settle on the land when they have left the schools?—Yes, the majority.

3811. There is no tendency for them to become experts and float off to some other country?—No.

3812. Do you destroy animals under your Stock Diseases Prevention Act, and do you pay compensation?—Yes, not full compensation, but a portion of their value.

3813. What proportion?—It is according to the different diseases. It varies from one-quarter to one-third.

3814. In the matter of dealing with these diseases, do you find that any serious difficulty occurs in the native States such as Basutoland and Swaziland?—We

have a ring round them, and no animal is allowed to come from them without being inspected.

3815. Has the prevention been as effective in these two States as in the rest of South Africa?—Yes, I think so. They have veterinary surgeons in these territories, and the Administrators of the two Protectorates you have mentioned have done uncommonly well.

3816. In speaking of co-operation with the United States Department of Agriculture, you seem to have, generally speaking, co-operated with the United States authorities in all classes of work which you have undertaken. I think you referred to the Agricultural Land Bank as being largely borrowed from the United States?—No, I do not think I said that, I do not think they have a Land Bank in the United States, as a matter of fact, neither have they got an agricultural parcels post; that was one of the things which the United States Commission, which recently visited England, particularly inquired into.

3817. You have received information from the United States Agricultural Department as to dealing with pests?—Yes.

3818-19. Now, in your inquiries into certain diseases peculiar to South Africa you have had assistance, I believe, from the Imperial Institute in your investigations, have you not?—In regard to what disease?

3820-21. I forget the name of the disease?—Would it be bitter pit in apples, because that is a thing which has been bothering us.

3822. No, it is a disease in animals?—No. With regard to animals we write to the Royal Veterinary College in London. I may mention that we gave 500*l.* to Professor Nuttall, of Cambridge, in connection with his investigations into ticks. If we have had to make special investigations we have generally obtained the services of some expert authority. For instance, Professor Theobald, of Wye College, has named all our mosquitoes. On the other hand, we sometimes go to Berlin or elsewhere in connection with some veterinary trouble. We have recently got out the chief veterinary pathologist in Zurich to inquire into a particular cattle disease.

3823. Do you not think yourself that provided the technical and scientific departments in the Dominions were co-ordinated with some institution like the Imperial Institute or the Department of Agriculture you would cover a very much larger field, and that the result would tend towards greater efficiency and greater completeness, and that you would gain better results, so far as this country is concerned, rather than by going to an institution like the United States Agricultural Department, which is only, after all, dealing with a fairly limited area?—We got chiefly from the United States the idea of our organisation, and we have had many officers of the department from the States. We have followed their experiments in many directions, and we have kept in close touch with them all along, but when we have had special problems to investigate we have gone to a world-renowned man to deal with them. For instance, the Chartered Company had Professor Koch to deal with certain diseases, and I am hoping that we may succeed in getting Sir David Bruce to clear up some of the matters he was dealing with some years ago before he was switched off on to sleeping sickness. I do not think you can confine yourself to any particular institution. You must pick your man. Your specialist must come out and see the natural conditions of the country just the same as Pasteur, when he investigated the silkworm disease, lived for many years in the silkworm districts, and, when he inquired into the subject of fermentation, lived in the wine-growing districts of France.

3824. Do you not think that much help could be obtained by co-ordination by experts with a view to obtaining the necessary information?—Yes, but in the meantime that work is beginning to be done by the Agricultural Institute at Rome.

3825. What do you suggest? — Where Great Britain could help us more than anything else is to train men as experts. For instance, I have had just recently to send for three entomologists to America. From the Board of Agriculture I could not get a single man when we started the Agricultural Department. I could get dozens from America. When the U.S.A. took over the Philippine Islands, they immediately started an Agricultural Department there, and found men for it from the department. But the Board of Agriculture in England could not have started an Agricultural Department here.

3826. Did the Union take its idea of the Agricultural Department from the Transvaal institution, which had been founded by Lord Milner?—Mainly.

3827. Now, in regard to these co-operative societies, what ground do they work over? You form them for irrigation purposes, I understand; do they go in for the business of supplying and importing farm produce?—They may buy and sell agricultural implements and supplies for their members, but their functions are strictly regulated by Act of Parliament and regulations.

3828. Are they co-operative societies in the scientific sense of the word or joint stock companies?—Yes. Each member is severally and collectively liable for the debts of the association. They cannot trade outside the societies. They can only sell the produce of their members and buy stores for the members.

3829. **(Mr. Tatlow.)** Is it obligatory on the part of stock owners to report at once the outbreak of disease among their stock?—Yes.

3830. Is that enjoined by Act of Parliament?—Yes.

3831. Is a penalty attached?—Yes, a heavy one.

3832. In the case of compensation to owners for slaughtering, if the animal is discovered to be free from disease, what is done?—Then we pay.

3833. When an outbreak of disease occurs on a farm, do you slaughter wholesale or only the animals affected?—It depends on the nature of the disease, and whether quarantining would meet the case or slaughtering would be necessary.

3834. Are any records kept of the mortality by disease?—Yes, we have details in regard to ordinary contagious diseases but not in regard to ordinary local diseases.

3835. Now, in regard to these co-operative societies; you say that after they have been established for a time interest begins to flag: is not that rather unusual in regard to co-operative societies? Does the Government take any particular charge of these societies?—We have inspectors—one inspector to every four or five societies. We have to pay the closest attention to them. Perhaps some of them borrow 100,000*l.* from the Land Bank.

3836. They have to submit their accounts to the Government, I suppose?—Yes, they have their books audited by auditors approved by the Government.

3837. Does the Government assist by any money contributions?—No, only by loans from the Land Bank.

3838. Are these co-operative societies being formed more in connection with the fruit-growing industries than in other directions?—I do not know. There are one or two co-operative societies in the fruit-growing industry here which are really joint stock societies, and one or two genuine co-operative societies in the Transvaal for the disposal of citrus fruits.

3839. Has it given an incentive to the dairying industry?—Yes, in the Free State it helps very much and in Natal.

3840. With regard to the rate for mealies, which you say has been very beneficial—does that rate apply only to mealies for export?—No, to mealies in the Union too. At first it was only for export, and then the farmers in one part of the Cape Colony, where they could not grow mealies and wanted them to feed ostriches, complained to the Government and got a flat rate for the whole Union.

3841. I see the General Manager of Railways, in his report for 1912, refers to the quantity of maize exported to oversea markets as being less than in the previous year owing to increasing local consumption, consequent on the adoption of an internal maximum local rate of 20*s.*?—I think it has been reduced to 10*s.* since, but I am not sure.

3842. Do the stock owners report promptly the outbreak of disease? Have you any complaints?—No. Of course, you sometimes get delay in reporting. You occasionally get lazy men who think the animal died from snake bite, but on the whole we have good reports.

3843. Have you inspectors about the country discovering these diseases?—We have about 50 veterinary surgeons all over the country—each one travels through his own district—and a number of stock inspectors. We are able to diagnose most of our diseases by an examination of the blood of the diseased animal. We distribute to farmers and policemen glass slides, and the farmer smears blood on the slide and sends it to Pretoria, where it is examined, and we can generally tell what was the matter with the animal. The police and field cornets are of great assistance in this direction.

3844. Does your department make any arrangements in connection with the transit of livestock by rail?—No, the Railway Department.

3845. **(Mr. Sinclair.)** Have you co-operative dairy societies?—Yes.

3846. With factories?—Yes, in the Free State.

3847. And are the settlers who supply milk to the factories shareholders?—Yes, they divide the profit. They get an advance on their cream or milk, and after the balance sheet is made up any balance is distributed.

3848. And I gather they are working with satisfactory results?—Yes.

3849. Have they had the effect of getting a better price for the settler?—I do not think you can say that. But they have had the effect of providing a market. Because before there was no market.

3850. You told us that stock was increasing, although you had not yet reached the numbers that existed before the war. Is the tendency for stock to improve?—Greatly. You can tell that by the agricultural shows, and the farmers have taken a great interest in it. We have had a number of energetic men who have settled in the Union and have brought with them a knowledge and love of good cattle, which has had a great influence.

3851. Is there a tendency on the part of sheep to go back?—That is a debatable point, whether if you get an animal from Australia it maintains its quality or not. Much depends on the district. There are some districts in South Africa where shorthorn cattle would grow as well as in England, and there are other districts where they would become rats.

3852. It is a matter of feeding?—To a great extent. In many parts of the Transvaal a Hereford would thrive and a Shorthorn would starve.

3853. The settlers are alive to the necessity of importing strains from time to time to keep up the quality of their stock?—Yes, and in some cases they have gone to excess, and money has been wasted on fancy stock.

3854. Some evidence was given by Mr. Rodgers, of the Board of Agriculture and Fisheries in England, on the subject of the regulations. I think you have referred to that. What have you to tell us about it? You have some cases that you can give us, have you not?—I said in my letter I did not think it would be practicable to draw up absolutely uniform regulations for the whole of the Colonies, because the conditions differ, and the Colonies have to be careful, especially the warmer ones, like this, because a disease which may not be much of a nuisance in England may develop to an incredible extent under different conditions.

3855. This was the evidence given in England. The Transvaal Government informed the Colonial Office that they proposed to prohibit the importation of potatoes on the ground of danger from disease. The Colonial Office replied that there had been some misconception about the disease and suggested a certificate of freedom of the locality from the disease?—We wanted to make quite sure that there was no disease within five miles of the place where the potatoes were grown, and also that there had not been any disease for a certain number of years. We feared that the spores might still linger in the ground and affect the succeeding crop. Mr. Rodgers said that they inspected the nurseries, and suggested that their inspection of the nurseries ought to be sufficient. But my argument was that many seedsmen in England do not grow their potatoes in their nurseries, but on farms belonging to farmers, because they have not sufficient land themselves. Therefore, the fact that the nursery was inspected was not sufficient.

3856. But were they not prepared to give a wider certificate than that which was covered by inspection of the nurseries? They were prepared, were they not, to give a certificate covering the locality, but you suggested that the certificate should cover the district?—I think we said within a radius of five miles.

3857. Do you not think that the locality would be quite enough?—We do not know what locality might mean. It must represent some area. We said, "What do you mean by locality?"

3858. But district is also indefinite?—I think we said five miles.

3859. There was no intimation conveyed to the Mother Country of the introduction of regulations forbidding the entry of potatoes into the country, so it was said. Do you know anything about that?—I am not quite clear about it. I saw the evidence, but I would like to point out that we always notify the High Commissioner in London directly of any change or alteration in our regulations ; and, as I remarked at the beginning, whenever we alter our regulations, considerable notice is always given in the Government Gazette. So that the information should be available through that source.

3860. What is done now?—We immediately notify the High Commissioner, and he notifies the Colonial Office and the Board of Agriculture.

3861. Do you still adhere to the five-mile limit?—Yes.

3862. What was objected to in England apparently was the need for giving the name not only of the locality, but of the whole county?—I think myself that county is a bad term.

3863. **(Chairman.)** You would reduce what was called county here to a five-mile limit?—Yes.

3864. Perhaps you will communicate that to the authorities in England?—Yes, I had a letter by last mail on the subject.

3865. You will take action?—Yes.

3866. **(Sir Jan Langerman.)** About the diseases—you have shown what progress has been made in stamping out disease in the country. Take horse sickness. Five years ago what was the rate of mortality among horses and mules?—The mortality among mules was such that practically the whole of the mules that were kept in the open in certain districts died of horse-sickness, and now they can be turned out at night with impunity.

3867. Mules more so than horses?—Yes, we have got on better with mules than with horses.

3868. What about East Coast fever?—What strides have you made in dealing with that?—The Transvaal is practically free.

3869. What about Natal?—We are improving considerably. In the Transkei the disease is bad.

3870. But originally did it not practically sweep the country?—Yes, so far as the low and middle veldt was concerned, but now it is well in hand.

3871. You told us that scab was also being dealt with. Is it on the decrease?—I think that tide is just turning. Certainly our organisation is good, and I am convinced that scab will decrease.

3872. So that in connection with new settlers there need be no fear of horse-sickness or East Coast fever among their cattle?—No. The settler is in a very different position to-day from what he was ten years ago.

3873. To show how the farmers themselves have progressed compared with five years ago, the carrying capacity per acre is now much larger than it was before scientific methods were adopted?—Yes.

3874. In regard to mealies, last year there was a short-fall in the exports, which you have explained by saying that it was due to home consumption partly.

How does the quality of our mealies compare with South American or North American mealies?—Oh, they are better.

3875. They command a higher price than any other?—Yes, they fetch a shilling or two a quarter more.

3876. Do you look forward to a bigger trade in future?—Yes, but I think that the home consumption will also greatly increase.

3877. Is there a greater acreage of mealies under cultivation every year?—Yes.

3878. I hear that in Natal they have erected machinery to extract vegetable wax from the stalk of the mealie. Have you heard about that?—No. I have heard of so many things being made from mealies that I should rather doubt it myself.

3879. **(Mr. Lorimer.)** In speaking about your land bank, I understand that the bank grants loans which you call involuntary, and then you explain these are loans in connection with the erection of fencing under the Fencing Act, and so on. In your memorandum there is an expenditure in connection with scab and the improvement of sheep and wool of 101,000*l.* Is that in addition to the expenditure under these loans?—Yes, this is entirely for inspectors, instruction, and administration.

3880. Does this amount include the money expended by the farmers themselves?—No, under our Stock Diseases Acts we have the power to compel any farmer who has cattle or sheep on his farm to erect dipping tanks. If we compel him to do so we also say, "You can borrow the money from the Government."

3881. Are you spending money on dipping tanks which you compel the farmers to erect and pay for, and are you spending in a similar way through the department money to the extent of 101,000*l.*? I mean to say are these sums cumulative—are they both spent?—Yes, this is purely administration.

3882. Now what are the Guano Islands?—They are some islands round the coast of South Africa from which we obtain our supply of guano for the farmers.

3883. Are they extensive?—They are small but numerous.

3884. Are they like the Peruvian deposits in South America?—No. This is fresh guano which is deposited each year by penguins and other sea birds.

3885. Is the expenditure 5,000*l.*?—No, that is a mistake; it should be 25,000*l.* The guano is sold to the farmers at cost price. As a matter of fact guano in London is worth about 11*l.* or 12*l.* a ton, so the farmers get the benefit of 5*l.* or 6*l.* a ton on every ton of guano we distribute.

Senator the Hon. Marshall Campbell, called and examined.

(*For the evidence of this witness on "Mail Service and Freights" and "Forests" see pp.* 75 *and* 289.)

3886. **(Chairman.)** I think you have some evidence to give regarding the sugar industry in Natal?—Yes.

3887. What is the present position?—Last year we produced 92,000 tons.

3888. What are the figures for recent years, are they increasing?—Since Mr. Chamberlain was here the industry has gone up by leaps and bounds.

3889. What is the possible or probable extension?—I think there will be about 50 per cent. more than we have now under normal conditions and circumstances.

3890. Is that due to extension of area or more intensive cultivation?—To the limitation of suitable areas.

3891. What market does it go to?—Our market is in South Africa. We did send some sugar to England about three years ago, but we were penalised under the conference about 2*s.* a ton.

3892. On what account?—They said we received a bonus on our railway preferential rates to Johannesburg; I think that was only on about 25 per cent. of our sugar, but we were penalised to the full extent.

3893. That is under international agreement?—Yes.

3894. What proportion of the total consumption of the Union do you supply?—About 92,000 tons last year out of 120,000 consumed.

3895. So you supply, roughly, three-quarters?—Yes.

3896. You can increase your production by 30,000 tons a year without having to seek over-sea markets?—Yes.

3897. Where does the principal competition come from?—From Mauritius.

3898. Under what terms do you meet that competition?—The great disadvantage, so far as Mauritius is concerned, is in regard to the labour question, because our labour is engaged in India nominally at the same figure as theirs, namely, 5 rupees per month; but we have to pay in shillings, whereas Mauritius pays their labour in rupees. 5 rupees are equivalent to 6*s.* 9*d.* in our money. The rupee is not legal tender in this country.

3899. Is practically the whole of the labour in the sugar industry Indian?—About 92 per cent. on our place.

3900. Is that Indian labour under white supervision?—Yes.

3901. What about competition from Portuguese East Africa?—That is a very serious competition, they compete with us very seriously in the Transvaal, they are allowed to come in duty free, and if we send sugar into the same country we are charged 24*l.* a ton duty.

3902. I suppose they come in free under some convention?—Yes, it was a convention made by Lord Milner.

3903. That convention was made for the purpose of getting native labour, was it not?—Yes.

3904. What is the duration of that convention?—ten years. I think about five or six years have still to run.

3905. Are there any other points connected with the sugar industry which you would like to bring to our notice?—Not specially. I should have liked to mention one matter, but it affects the fiscal question.

3906. Well, that is outside our competence. Are there any other non-fiscal points?—There is nothing more about sugar.

3907. Outside sugar are there any other crops on which you would like to speak?—No, not specially. We have fibre. We have just started the fibre machinery, and we do not know yet how it will turn out.

3908. What is the fibre produced from?—It is produced from the aloe.

3909. Is that an industry with a considerable future?—Yes, a very big future.

3910. **(Mr. Sinclair.)** Does the sugar still get preferential treatment on your railways?—Yes, to Johannesburg.

3911. I observe that in the statement of exports of South African produce to countries over-sea in 1909 the exports of sugar and sugar products were 16,116*l.*; in 1910 there is an enormous jump to 47,513*l.*, and then there is a fall in 1911 or 1912 to approximately what the figures were in 1909. What accounts for the enormous jump in 1910?—That was a bumper crop.

3912. Was that due to the exceptionally favourable season?—Yes.

3913. Did that mean rain?—Rain and sunshine at suitable times.

3914. **(Mr. Campbell.)** Is the production of sugar irregular? Are the seasons irregular?—Yes. It is only a semi-tropical climate. We reap every two years.

3915. You speak of the Sugar Convention limiting your export, but so far as Great Britain is concerned the Sugar Convention does not exist, does it?—I think it finishes this year.

3916. After this year you will be able to export without any countervailing duty to Great Britain?—Yes.

3917. Would you be able to send sugar from here to Great Britain profitably ?—I do not think so.

3918. What is the reason ?—It is a question of labour, just in the same way as it is in Australia.

3919. Is not the labour cheap ?—Yes, but it is a vanishing quantity.

3920. You do not expect to get any further labour from India ?—No, it has been stopped.

3921. Cannot you adapt the indigenous coloured labour to this work ?—The Zulu looks upon this work as *infra dig.*, he thinks it beneath him to take a hoe in his hand.

3922. Why is that ? Sugar cultivation is not very different from mealie cultivation ?—The Zulu does not take a hoe.

3923. Well, his wife does ?—Yes.

3924. Will not they do the work ?—No.

3925. Is not the supply of labour in Natal sufficient to meet your demand ?—No. We have to compete against the goldfields for the labour.

3926. But the goldfields only require men, and you could make use of the women ?—But the women would not go to work.

3927. How do the yields of sugar per acre compare with other countries, say Java ?—Ours correspond more with Queensland.

3928. They are not so high as the Java yield ?—No, and not so high as Honoluln and Cuba. I would like to say that about five or six years ago Australian sugar was dumped into this country about 12*s.* 6*d.* a cwt., and it was being sold in Melbourne at the same time at 19*s.* 6*d.* to 21*s.* 6*d.* a cwt. Every now and then that happens to us. They make big contracts with Java, and they have to dump the surplus sugar into South Africa or somewhere else. It would pay them better to throw it into the sea. We cabled to Australia and we found out the price sugar was being sold in that city on the same day as it was sold here at 12*s.* 6*d.*

3929. You have an import duty on sugar, except in the case of the Portuguese territories ?—Yes.

3930. What is the duty ?—3*l.* 10*s.*

3931. Is there any excess of sugar here ?—No.

3932. **(Mr. Lorimer.)** Is refining as well as cane-crushing done in Natal ?—Yes.

3933. Then everything that is consumed in Natal is prepared for use in the market here ?—Yes.

3934. Is the cane sent to factories ?—Some of it.

3935. The bulk of it ?—No.

3936. And some growers have their own factories, I presume ?—Yes. We have 15 growers who supply our mill with cane, and the balance is our own cane. We buy about 7 per cent. from farmers round about.

3937. Do you do the crushing and refining for the smaller growers ?—Yes, but not altogether.

3938. Do you buy the cane right out from them ?—Yes.

3939. With a firm like yours to deal with, these growers can always find a market ?—Yes.

3940. Is the small grower increasing in number ?—Very much so in Zululand.

3941 So that a man can work a few acres of sugar along with other crops ?—Yes.

3942. And that cane is sent in to you ?—Yes, and to the other mills also.

3943. And what size of farm or estate would be considered necessary to justify a factory ?—About 10,000 to 15,000 acres.

3944. Are there many of these in the Colony ?—About eight of that size and a lot of smaller ones.

3945. Is every factory provided also with a refinery ?—No.

3946. How many refiners have you ?—We are making white sugar from the cane juice direct. That is not like the old times, when, as a rule, they sent it in barrels to the refiners. On the estates now they make a semi-refined sugar; it is not so pure as the refined sugar, but they make it so well now that it is very hard to distinguish one from the other.

3947. Is there any difference in your production or extraction as compared with the West Indies ?—No, we do the work equally well.

3948. You are satisfied with what you get ?—Yes. We have just introduced about 100,000*l.* worth of sugar machinery within the last five years, and we are keeping abreast of the times now. Up to six years ago we were very behind.

3949. You have renewed your plant ?—We have scrapped the old plant.

3950. What percentage of recovery do you get ?—As near the world's record as possible. We have brought the figure down from 20 tons of cane to 9½ tons last year, and the year before last it was 8½ tons of cane to 1 ton of sugar.

3951. So there is not very much left in the megass ?—No.

3952. And do you use the megass as fuel ?—Yes, it is practically perpetual motion when once you get started.

3953. But you have not got to the length of exporting ?—No.

3954. Are you within sight of supplying the Union ?—I think so in the next five or six years.

3955. And after that you will expect to export sugar ?—I think we will hardly be able to produce enough for the needs of this country.

3956. Will you kindly tell us the comparison of your prices here with the prices in the world markets, say, in London ? What do you sell your sugar at ?—We are guided by the London prices, which we get every week.

3957. What is the relation between the London prices and your local prices ?—It is the difference of freight and duty.

3958. You keep at a level which is just sufficient to keep the market ?—Yes, we have to keep under.

3959. You have freight insurance and duty in your favour ?—Yes.

3960. And you keep to that level ?—Yes.

3961. Suppose your production went up beyond the requirements of the Union, could you sell in London in present circumstances at a profit or not ?—There would not be much profit, because ours is a semi-tropical climate, and we reap our cane every two years, other countries cut it every year.

3962. So you could only use London as a market for your surplus produce ?—Yes.

3963. And you would almost dump ?—Yes.

Cape Town, Friday, March 6, 1914.

Mr. J. M. STEPHEN, Managing Director of the South African Milling Company, called and examined.

3964. **(Chairman.)** I understand you will give us information regarding the possibilities of wheat cultivation in the north-western district of this Province ?—Yes.

3965. First of all, what are the limits of the north-western district ?—That is rather difficult to say, but where the development is now taking place is on the Zak and Great Fish Rivers. In regard to our own requirements in the way of wheat and flour, if it would be of interest to you, I have here a statement showing the quantities produced in this country. In 1911 we grew six million bushels of wheat. I have put it in bushels because I think that is the custom in most parts of the world It is exceedingly difficult to get anything in the way of reliable statistics in South Africa; that has been my trouble in obtaining any

figures that I can submit to you with any degree of certainty, but I think these figures are fairly accurate. In 1911 we grew 6,034,000 bushels of wheat, sufficient for about six months' consumption. In 1912 our production was 7,705,000 bushels, nearly equal to 7½ months' requirements. In 1913, owing to severe drought in the Orange Free State and the northern parts of the Union, there was a considerable setback, necessitating importation on a rather high scale, but granted normal conditions in this country we might expect to balance production with consumption in about six or seven years, if our policy of steady expansion of railways is not arrested. The development of the Zak and Great Fish Rivers is due to the extension of the Carnarvon Railway, and would probably supply sufficient wheat to cover one-third of our deficiency; the remaining two-thirds may be looked for from increased production in the cereal districts of the Cape, the Transvaal, and from wheat lands in the Free State and Basutoland. If we grow enough to supply our own requirements it is as much as we can hope to do. I do not anticipate that we shall ever be in a position to export wheat; if we do it will only be in very moderate quantities. The increase of our production of wheat is something that deserves more attention from our governing bodies than it has hitherto received. Apart from economic considerations, I am of opinion that one of the greatest services that we can render to the Mother Country is to make South Africa absolutely self-reliant in the matter of primary foodstuffs, so as to free the authorities in Great Britain from the anxiety and cost necessary under present conditions to protect our foodstuffs in transit by sea in the event of serious European complications. That has been my view for many years, and it influenced me in taking up the Zak River scheme in connection with the company of which I am the Managing Director.

3966. I understand the consumption of wheat in the Union of South Africa is about 12 million bushels a year?—Yes.

3967. Is that increasing or decreasing or does the figure remain fairly constant?—I think it is slightly increasing, not so much on account of the increase of the white population, but rather of the fact that our natives are acquiring a taste for bread. When they come down to work at our ports they seem to get away from their native maize and acquire a liking for wheaten bread, so possibly the consumption is increasing.

3968. What is the price of wheat compared with the price of mealies?—There is a considerable difference; we are paying the farmer to-day for bags of 200 lbs. of wheat delivered at the nearest railway station, 19*s*. In regard to maize, we can get it down here just now for about 11*s*. per bag of 200 lbs., good quality. Comparatively little maize enters into consumption here; the native uses a certain amount, a limited amount is used by the white people, the larger portion is used for feeding cattle.

3969. Is it the case that it might suit the farmer better to grow mealies and export them, bringing in exchange the required amount of wheat?—No, because I think that our wheat lands would not grow maize so well. Take, for instance, the north-west district to which I have referred, and where we have tried maize. I do not know exactly, because we have only been there a couple of years, but I believe the results were not satisfactory; on the other hand, we can grow magnificent wheat and probably cheaper than in any other place in the world.

3970. Is that dry farming?—No.

3971. What about the influence of railway development in the extension of the wheat area?—I am hoping that there will be a considerable extension following railway development.

3972. Is railway extension going on at an adequate rate?—Not to please me individually, for we really have to depend on agriculture in South Africa to a great extent. We know that the mines, valuable as they are to-day, are a diminishing factor; we have to look to the future, and we need railways for the development of the country in the direction of agriculture. Take, for instance, this north-west district, it is one of the richest parts of the country; it is at present about 130 miles away from the nearest rail-head. The Government last session passed an Act to take the railway there. The Zak River Estates, which is practically a branch of the South African Milling Company, need about a quarter of a million of money putting into it before we have finished developing that proposition, and I am hoping that we shall go on modern methods right through and make use of mechanical power to a great extent, and I am also hoping that it will be a practical lesson to the agriculturists round about and induce them to adopt better methods.

3973. Is a new railway line contemplated?—Yes, they commenced the earthwork last week.

3974. When will that be finished?—In from two to two and a half years.

3975. Will that railway pay from the first?—No, I do not think so, but I look to development in other directions. We shall not confine ourselves to wheat; it is a great district for cattle; cattle disease is unknown up there; we shall have a number of side lines, and we are hoping that what we are doing will encourage others to develop. I hope it will pay the railway, as unquestionably it will pay the country.

3976. Have you an adequate labour supply?—No. That is a difficulty there, and that is why I feel it is absolutely necessary to go in for mechanical ploughing and power generally. We have now a farm tractor which we imported recently; the tests so far have not been altogether satisfactory, but in course of time we shall hit on the best method and we shall have to have several tractors.

3977. Will you have to rely on coloured labour?—We shall have a certain amount of both; we shall have to use the educated white man; in fact, we are gradually getting young South Africans there, because when the railway comes we shall have to go ahead at full speed, and as far as possible we are confining our selection to men who have passed through agricultural colleges.

3978. What does your land cost you?—Roughly, from 3*l*. to 4*l*. a morgen for irrigable land.

3979. Have you to pay for your water?—No, the water comes down the Zak river, which is an intermittent stream which depends upon rainfalls in the mountains in the districts of Prince Albert, Frazerburg, and Beaufort West. The river has been known to run for 60 days at a stretch; we can usually depend on its coming down twice a year, and then we dam it up and use it that way. We do not count upon more than five inches of rain.

3980. Is it a good ranching country?—That is another thing. We want to get the farmers round there to grow lucerne, because at times it is very dry, and the farmers have to send their cattle a long distance to Bushmanland. The district used to be splendid for wool. Calvinia, I believe, took the first prize at the first London Colonial Exhibition many years ago.

3981. Why has it gone back?—I think then they must have farmed on a very small scale, and they have not made the most of the rivers coming down, perhaps from want of capital. That is another thing; we have bought a good many of these farms from them, and I am hoping that the money that they have got from these farms they will use for developing other areas. I think it is from want of capital to develop their stock and make the most of the water which has prevented this district from coming to the front long ago, and besides that they had two or three years of drought, which killed off an enormous amount of stock.

3982. **(Mr. Sinclair.)** I gather that the wheat lands which this projected railway will tap are State lands?—No, not altogether; but there is still a fair quantity of land held by the Government, and close to us. The Government is establishing what one may call a closer settlement scheme, and they have made arrangements in connection with bringing water over our farms.

3983. Can you give us, roughly, the areas of land which will grow wheat and which are in the hands of the State and those which are in the hands of private

individuals, which will be tapped by this projected railway line?—I am afraid I cannot.

3984. Is most of it State land?—No, the irrigable land is more in the hands of the private people, I think.

3985. Then these railways will tend naturally to increase gradually the values of lands that are now held by private people?—Yes, of course.

3986. In view of that fact, has any movement been made by the State to resume the land before adding that value?—No.

3987. The settler who has been fortunate enough to acquire this land will therefore benefit by this capital expenditure of the State?—Yes.

3988. Is there any imposition by way of a rate or charge on these lands to help towards the cost of railways?—No, the cost of the railways will be borne by the State, but I suppose it is looked upon in this way: that there are so many indirect advantages that will accrue to the general community that it is the duty of the State to undertake this work. I expect that is taken into consideration, and then besides that we have to consider these people. We have been enjoying our railways close by for years, and when there has been a deficiency in the railways it has been met out of the general revenue, to which these people have contributed in the past.

3989 What is the area of the lands of which you have been speaking? What area of these wheat-growing lands would be sufficient for the new settler when they become available?—You mean the Government lands?

3990. You might give us them separately. Give the Government land first which is suitable for wheat-bearing. What area would be required to maintain an intending settler and his family?—It is difficult to say. I could not give it, but I think the Government are letting it out to these people down there at the rate of about 16 morgen of land to each family. I am not quite sure about these figures.

3991. Is it the intention to try to develop the new wheat-growing areas that may be made available in such a small way as by farming 16 morgen?—Yes. They are giving these pieces of land out to what they call down there indigent families: they are somewhat different from the class of people we know in South Africa as poor whites, they are rather a superior class, but they have no capital of their own.

3992. What capital would be required to take up such a farm?—As a first start, I should imagine if a man had about 100*l.* outside of his house and furniture, that would be enough. I think that would be sufficient to start on a very moderate scale. I am supposing that he is a man of thrift and energy, and if so, this would gradually help him on.

3993. Will the areas of which you have been speaking that will become available be absorbed by white people that are already in the country?—Yes, to a great extent.

3994. What room is there for intending settlement from outside?—Well, I do not know that there is very much there because land in that part is after all only very limited for wheat-growing on account of the fact that you can only successfully cultivate close to the rivers, so I do not think that one can say that the North-West district would offer for some time to come any very great inducement for people over the water.

3995. Generally speaking, and putting it broadly, the outsider who comes to this country to take up land must have a certain amount of capital?—Yes.

3996. If he comes here with capital he can get land and he can get cheap labour?—Yes.

3997. So that if a man has a reasonable amount of capital there would be a prospect of a comfortable livelihood?—Well, I should be inclined to say more. I do not know, and I cannot think of any country in the world that would offer better conditions to an agriculturist, provided he has a certain amount of capital, than South Africa, and provided there is a steady expansion of the railways. Much as I would like to see the white population of this country increased, especially by the up-to-date agriculturist, I am a little bit afraid that we are not justified in encouraging anything of that kind at the present time because the land in touch with the markets is now held so firmly and at such high rates. Outside you can get land that would encourage a man to farm, but where would he find a market? He is so far away from the railway that I am afraid there would be a danger not only of loss of all his capital, but also in an increase in the number of our poor whites; but I think that with the extension of our railways we can offer inducements to the pushing agriculturist.

3998. Are you in reasonable sight of being in a position to provide the bulk of your own food supplies?—Yes, but it depends on the extension of the railways. I really think we are going to equal our consumption in six or seven years.

3999. **(Sir Jan Langerman.)** Can you tell us what is the consumption of wheat and flour in the Union and what is the production in this country?—Yes, roughly about 12,000,000 bushels a year.

4000. What do we produce ourselves of that 12,000,000?—We grew in 1911 about half of our consumption and in 1912 rather more; we grew about sufficient for about 7½ months' supply. Last year, as you know, there was a tremendous drought throughout the Free State and Transvaal and northern districts of the Cape Province that brought down our production tremendously.

4001. I see you imported last year nine million bushels of wheat and flour?—Yes.

4002. Of course, the wheat area in the Union is very limited?—Yes.

4003. We have wheat in the Western Province and on the Basutoland border of the Free State?—Yes.

4004. With dependable wheat supplies?—We are doing more in the Transvaal now. I do not know whether we are going to be as successful as the Agricultural Department hopes, but we are not doing badly.

4005. But in the Transvaal the rainy season is at the wrong time of the year?—Yes, there is some danger of that.

4006. If we want to supply our requirements we have to look to the scheme you speak of in the North-West district?—Yes.

4007. Do you think you can grow sufficient wheat in the North-West district to supply our wants?—No. I am looking for increased production in our own districts. In the Transvaal I am inclined to agree with you that there will not be so very much, but there will be a certain amount. There is plenty of scope in Basutoland and the Free State and in our own Province. There will not only be this development in the North-West district, but considerable development in other parts, for instance, in the district of Caledon and in Bredasdorp. There we are steadily advancing.

4008. But granted that we have those areas for wheat-growing, we must assume that the farmers are not growing wheat because they can grow something else more profitably?—No, I would not say that; it is because they are not in touch with the market.

4009. What has developed Caledon?—Development during the last three or four years has been wonderful. It has simply been due to railways. You passed a Bill last session extending the railway in the direction of Bredasdorp, and next year you will see a still further development.

4010. As we have made a railway to Bredasdorp, have any new wheat lands followed that railway?—Yes.

4011. As railway extension grows there will be an extension of wheat land in the Union, that is your opinion?—Yes.

4012. In the area you have been speaking of, that is the North-West district, the cultivation of wheat would be entirely dependent on the rainfall?—No, we do not get much rain there. We depend on the rivers.

4013. Well, that also means rainfall?—I thought you meant in the district. We depend on rainfall in our cereal districts in the Western Province where we have no rivers.

4014. In the Western Province, where they have no regular rainfall in the winter, you can depend on the crop?—Yes.

4015. But in the North-West district you cannot depend on a regular rainfall?—No.

4016. You must cultivate by means of irrigation?—Yes.

4017. You build a dam for water which has fallen higher up the river?—Yes.

4018. Then if there is no rainfall in one year you cannot grow wheat?—No.

4019. So it would be a very precarious thing for a settler to go there and take up land for wheat-growing if he could not depend on a regular rainfall?—He must not count on the rainfall, in that district it cannot be depended on, it is sometimes as low as 5 inches, but the rivers come down; in the case of the Zak River it comes down right away from Prince Albert, Beaufort, and Frazerburg. There is a catchment area about as large as the whole of Scotland. All that water gets into the Zak River and down it comes. You tap this water, which in the past has been allowed to lose itself. These people would have to dam the rivers as they come down. In this country our company have made over 50 miles of dams already, and these men would have to do it on a small scale; I took that into account when I gave the amount of capital necessary. The cost would be small; they would make these dams of mud and earth.

4020. Has it not been known in this district that for two or three years at a time no rain has fallen at all?—Not for two or three years. The river has failed to come down, so far as we can gather, about three times in twenty years, but the ground is very rich; the rivers have been bringing down the rich soil for centuries. These people would not require any fertilisers and one good crop would perhaps tide them over one bad year at least.

4021. It is not very desirable for settlers to go there and wait until they get that good crop?—They would not have to wait more than one year.

4022. You believe that that area itself will supply a large proportion of our requirements in wheat when the railway line has been extended into the district and from that source and other sources we shall be able to feed ourselves ultimately?—Yes.

4023. And be able to export?—No, I do not expect that, because of the limited amount of land in the country which is suitable for wheat-growing.

4024. **(Sir Alfred Bateman.)** Those bushels that you refer to are 60 lbs. I suppose?—Yes.

4025. Is that about the natural weight of your wheat?—No, ours exceeds that.

4026. By how much?—I should think down there in the North West we might safely say anything between 65 and 70 lbs. to the bushel.

4027. As regards the yield, we are informed that in Australia it is from 9 to 20 bushels per acre. In your country I suppose it is more?—I have taken an average which is in excess of any wheat land about here, which I do not think would give more than 10 bushels per acre in, say, the Koeberg and Malmesbury district, but at the Zak I have taken the moderate figure of 17 bushels to the acre.

4028. That is very rich soil?—Yes. I might explain that some of the stools of the wheat grown down there contain as many as over 200 shoots. We cannot trace anything like that in the world.

4029. But 17 is not large?—No; sometimes it is as much as 30.

4030. We can grow that in the Old Country?—Yes, but that is with your fertilisers and heavy rain-fall.

4031. Can you grow wheat every year on this soil without the fertilisers?—Yes.

4032. You have a very cheap rate for carrying wheat on your railways?—Yes.

4033. I see it is only 19*s.* for 2,000 lbs. for a distance of about 500 miles?—Yes.

4034. That is about one-third or less than what the railways charge on imported grain?—Yes, about that.

4035. That is a very valuable help?—Yes, and that goes to the farmer, not to the consumer.

4036. How far from the railway can you grow wheat as a rule?—I should not like to grow it beyond 20 or 30 miles.

4037. And you say you give about 19*s.* for 200 lbs., that is about 5*s.* 6*d.* a bushel?—Yes.

4038. And you say the demand is increasing and that the coloured races are inclined to eat more wheat?—Yes, it is slowly increasing irrespective of the increase in the white population—that is not increasing to the extent that we would like to see—but the native is acquiring a taste for bread. I think the same thing is happening in Japan, where the people are giving up rice to a certain extent.

4039. But if wheat is dear, I suppose he goes back to his native mealies?—Yes.

4040. **(Mr. Campbell.)** I take it from your evidence that it is the rainfall that limits the wheat area; the quality of the land is good enough but the absence of rain is the limiting factor?—Not merely that; there are certain lands which are good for wheat and certain other lands that would be far better for, say, vines, but, generally speaking, I think you may say it is the uncertainty of the rainfall.

4041. There is a large area of land that would be suitable for wheat-growing if the rainfall were sufficient?—Yes.

4042. What would you say would be the average cost of growing a bushel of wheat. What would be the price below which wheat cannot be grown here at a profit?—I have never found a farmer yet, although I have urged upon dozens of them the importance of it, who would keep proper accounts. Of the money he puts into the ground and the crops which he produces he does not know, but he will tell you that unless he can get 16*s.* or 17*s.* a bag of 200 lbs., which is about 5*s.* a bushel, it does not pay him; he says he needs that amount to bring him back his outlay, but he does not keep accounts. We are doing it in a proper manner at the Zak River and we calculate that wheat there will not cost us more than, say, about 1*s.* 6*d.* per bushel.

4043. But you would not pay anything like that price for wheat in South Africa, would you. The average price of wheat would not be more than 4*s.* a bushel, would it?—6*s.* would be an extreme price; I think the average would be about 5*s.* to 5*s.* 6*d.*

4044. What is the average price of wheat in South Africa during the last three or four years?—I should say, taking the last three years, it would not be less than 5*s.* 6*d.* or 5*s.* 9*d.*

4045. What is the duty on wheat in South Africa?—1*s.* per 100 lbs.

4046. What would be the average price you would pay for this land which you will irrigate for wheat-growing; I think you told us that the average return of that land would be about 15 bushels?—It would be rather more than 15 bushels, but I am taking a very moderate average on good and bad land about 17 bushels.

4047. How much would it cost?—Between 3*l.* and 4*l.* a morgen.

4048. And for the construction of irrigation works how much?—I should have to separate the small farmer and the big man who wants to go in for it extensively. The big man would go in for earthworks and block dams which would, of course, cost him more, but the small man would be satisfied with earthen dams for his small plot, which would not be very expensive; I should think perhaps 1*l.* or 30*s* per acre.

4049. Would you say that 4*l.* an acre with the irrigation works would be the average price of land that would grow 17 bushels?—Yes, about that.

4050. Is there any room for the extension of that irrigation business?—No, I do not think that there is, on account of the water coming down in limited supplies. If it comes down about 60 days in the year that is considered good.

4051. In reply to the Chairman I think you said that the average consumption of wheat in South Africa was 12 million bushels a year. The consumption of wheat, I suppose, is now restricted to the white population?—The white and coloured population as apart from the raw native.

4052. That would be about half the total population of South Africa using the wheat?—No, hardly that.

4053. Is there any evidence of a change on the part of the natives from maize to wheat?—Yes, when the native comes down to the port or works on the farms about here he gets a taste for bread and he goes off his mealie porridge.

4054. That change is likely to increase?—I think so.

4055. So the future consumption of South Africa will be considerably more?—The great bulk of our natives are in the Transkei and other districts and you must remember that they still probably continue their mealie-growing and they are not able to grow wheat very well. It would only be those natives who come to the towns.

4056. Does the native prefer wheat foods if he can get them in preference to mealies?—Yes, once he acquires the taste.

4057. Do you fix a wheat standard for buying wheat?—No, it is according to the sample, there is so much variation.

4058. I understood you to say that the average weight of wheat was 65 to 70 lbs. per bushel?—Yes, on the Great Fish and Zak rivers.

4059. The average would be 67½?—Yes.

4060. You deal very largely with Australia for wheat?—Yes.

4061. Have you anything to say to the Commission or any comments to make on any difficulties that occur in connection with the trade?—I was going to ask permission to make some remarks on this subject. We have to import wheat and flour very considerably from Australia; Canada supplies a fair quantity, while the imports from South America have fallen off a good deal; New Zealand used to send a share but owing to various causes not now. A very grave complaint has been made by the South African importers of wheat as to the serious shortages in the consignments delivered from Australia, the instances being rare indeed that the delivery and invoice weights approach one another. The certificates both as to quantity and quality apparently afford but little protection to the South African miller, who is thus seriously handicapped in his competition against imported flour. Australia is the worst offender in this respect. Canada is rather better, while New Zealand weights may be relied upon. The attention of the Australian authorities ought to be drawn to this subject, because the present methods occasion much loss to some of the customers of the Commonwealth and lend themselves to considerable improvement.

4062. What steps did you take to remedy that?—We try to get a guarantee, but sometimes we cannot get that. We take the weights as delivered here and I may say that the grain is very carefully weighed at the docks, where they have splendid scales. I will just give you an instance. Last December we got one vessel and the value of the wheat short was no less than 482*l.*; we tried to get it back, or rather, we are trying to get it back but do not think we will. There is one vessel in the dock now, I do not know how it will turn out, she has brought us 81,000 bags; there is always a tremendous shortage which we have to pay for; we send our letters of credit but we cannot enter into a law suit over there; we sometimes just pocket the loss. There was another case about eighteen months or two years ago where the loss was over 1,000*l.* The matter was arbitrated on in London and a man was sent from Australia to look into the Harbour Board methods and to look into our books. We were successful in that action and we got the whole of that amount. There is scarcely a shipment that does not leave us with a tremendous shortage.

4063. Is there anything you can suggest to remedy this trouble?—Yes, I am hoping that this Commission will be able to see its way to move the Commonwealth Government to take this matter up.

4064. From what part of Australia does the wheat usually come?—Pretty well all round. We do not get so much from New South Wales because the quality is not so good.

4065. There is this fact to bear in mind, that wheat gains on a long sea voyage; is it the custom, do you think, to make allowance for this? Is there any general rule?—Yes. I think it is done this way, I think they average; I think they just take occasional bags and weigh them, but here at the Harbour Board they weigh every bag; of course, we have to pay them for that, and that is an additional loss. But the Australian shipper gets his average—I am not assuming this, because it came out in a Parliamentary Commission—I think that the shipper gets his average weight, and then he assumes that on the voyage the wheat will absorb a certain percentage of moisture and he claps that on his invoice.

4066. **(Mr. Campbell.)** I suppose it is borne in mind that he did not clap anything on to the buying price when he bought the wheat from the farmer in the original case?—Very likely.

4067. Do you suggest that the net weight at the port of shipment should be the net weight checked by the Commonwealth?—Yes, and the man buying it should pay for what he gets.

4068. He takes the benefit that comes from the moisture absorbed on the voyage?—Yes. Climatic influences also are at work in this connection. If the wheat were shipped in a very dry state in Australia it would absorb more moisture than if it were shipped in a damp condition.

4069. **(Chairman.)** Would handling the grain in bulk by elevators avoid that difficulty?—Yes, because it would be weighed by the Government scales under Government inspection and we would simply pay 20*s.* for the sovereign's worth of grain.

4070. Would that be the preferable system in your judgment?—Yes.

4071. Is there any idea of introducing it here?—No, because we do not export, but it has been considered in connection with the export of maize. It is proposed to have elevators and if they did that system of weighing would come into use.

4072. So far as your arrangements with Australia are concerned the adoption of bulk handling would avoid this inconvenience?—Yes.

4073. What ships does the grain come in, in liners or tramps?—In liners as well as tramps, but we prefer tramps because we prefer whole cargoes. With the regular liners their time is limited and they have to bundle the stuff in and out. There is always a loss because the Australian bags are not of the best quality and they break and a good deal of the wheat falls into the hold amongst other cargo and we do not get it.

4074. What is the ruling rate of freight on wheat from Australia to this country?—Roughly, in the neighbourhood of 27*s.* 6*d.* The "Clan MacWilliam," now in dock, was chartered at 26*s.* 6*d.*, 27*s.* 6*d.*, and 28*s.* 9*d.* for three ports.

4075. Do you know what the rate would be on a similar cargo from Australia to England?—No, but probably about the same.

4076. I suppose England would be about the same rate, say 27*s.*?—I could not say exactly.

4077. You cannot give us a general comparison of the freights from Australia to the Cape and the freights from Australia to England?—There is very little difference. There is the advantage to vessels in England in getting coal and in the matter of cargo. Here we can now give them fairly cheap coal but we cannot give them cargo.

4078. As a matter of fact, what do tramps do when they come here with grain? Do they take coal to India and then take wheat home?—Yes, that is often so. There is a vessel now in port, she is going to India from here *viâ* Natal and will very probably take coal there.

4079. Is any large amount of goods sent from the Cape to Australia?—No, the balance of trade is all in favour of Australia.

Oudtshoorn, Tuesday, 10th March 1914.

Mr. John Leroux, Ostrich Farmer, of the farm "Baakenskraal."

The Commission visited Mr. Leroux's farm, and witness made the following statement:—

I am an ostrich farmer, and I have 500 birds on this farm. They are fed mainly on lucerne. I run about five or six to the morgen. It is true feathers have dropped in price, but as long as the farmer in the district can get 3*l.* per bird he can keep them profitably. At present we get 3*l.* 15*s.*, 4*l.*, and sometimes 5*l.* I should say the average for some years past has been 8*l.* —those who kept a good stock. The price dropped in June last year. I think it will be some time before feathers recover to their former price. It is just a matter of fashion. There were nearly 120,000 ostriches in the district last census The district is, roughly, 60 miles by 30. The stock is increasing. For a good pair of breeding birds the price is anything from 100*l.* or 150*l.* upwards. There are some birds that could not be bought for 1,000*l.* As regards the length of time an ostrich remains in profit. I have an old cock now about 30 years old and he is still all right. We have no data regarding the age to which they live, but we know of birds 30 and 35 years of age. We are now only starting to collect data. I do not think we have any of the original wild birds now; ours are all domesticated. I think it is the climate and the soil that make this district so suitable for ostriches. The farms differ as regards soil. Most of my soil is alluvial deposit from the river. The soil is soft and dry. Consequently, the feathers do not get injured or soiled to such an extent as they would on hard, gritty soil, or where water accumulates. We do not get much rain here, only about 10 inches. If you have too much rain it is bad for the feathers, but you require rain in the mountains so as to bring the rivers down for irrigation. The price of feathers varies a great deal. It is anything up to 30*l.* a lb. It is largely a matter of fashion and taste. As regards breeding, we generally put two hens to one cock, and the hens lay up to 24 eggs. Regarding the health of the birds in captivity, it is seldom that a full-grown ostrich dies off. The adult birds are quite hardy, but there is a high percentage of losses among the chickens. The ostriches suffer from parasites, chiefly worms. We only expect to rear one-third of the chicks that are hatched. I have hatched 22 chicks from 22 eggs, but I was very lucky to get that result. It was a good strain. We can have as many as four hatchings in a year, but usually we get two or three.

Regarding the value of my land, it used to sell for 300*l.*; it is difficult to say now.

I have also some 20 head of Friesland dairy cattle grazing on the farm. They are kept chiefly for the butter, which I can sell at 1*s.* 3*d.* and 1*s.* 6*d.* a pound.

Oudtshoorn, Wednesday, 11th March 1914.

Mr. E. T. L. Edmeades, representing the Oudtshoorn Farmers' and Fruit Growers' Association, called and examined.

4080. **(Sir Rider Haggard.)** We understand that you wish to give certain evidence on the subject of ostriches and tobacco?—Yes. I wish to put in a Memorandum, prepared for the information of the Dominions Royal Commission, framed by a committee consisting of Messrs. J. Matare, A. E. Martin, and F. Muller Rex representing the Oudtshoorn Chamber of Commerce, myself, A. H. Mulder, and C. J. Serfonteyn, representing the Oudtshoorn Farmers' and Fruit Growers' Association, and Councillors A. Jacobsohn (Mayor), K. Schenck, and R. F. Chambers, representing the Town Council of Oudtshoorn.

Memorandum put in as follows:—

On the 21st January 1914, Mr. Frank Robb, who had been appointed by the Government of the Union to organise the tour in South Africa of the Dominions Royal Commission, had an interview with the Oudtshoorn Chamber of Commerce, in which he explained the constitution and objects of the Commission, and suggested that a Memorandum should be drawn up and evidence offered when the Commission arrived here on the 10th or 11th March. The Chamber of Commerce invited co-operation and the above joint committee resulted.

This committee decided to confine their attention to the two largest industries of the district, namely, ostrich feathers and tobacco, but at the same time wish to express the opinion that the Commission should obtain from other sources information and statistics with regard to dried fruits, wine and brandy, buchu, and bush tea. All these are produced here, but it is admitted that there are other districts in the Cape Province where they form a more important asset than in the district of Oudtshoorn. A very large quantity of lucerne is also produced in this district, but as the whole of the output is consumed locally or within the Union the committee merely mentions it, because it is owing to the exceptional advantages we possess in the production of the fodder plant that we hold the position of being the chief ostrich feather-producing district in the world. The census returns of 1911 gave the production of lucerne hay in the Union of South Africa as 122,919 tons, and of this amount Oudtshoorn district produced 19,199 tons, or nearly one-sixth. These figures naturally do not include the vast amount of lucerne consumed on the lands and that stored for winter use.

Ostrich Feathers.—The following table will show the great strides the ostrich feather industry has made in this country, and the important position it now holds in our commercial assets:—

Year.	Export.	Value.
	lbs.	£
1870	28,785	91,229
1880	163,065	883,632
1890	212,276	517,009
1900	412,832	879,751
1905	471,024	1,081,187
1907	598,358	1,814,232
1908	637,815	1,738,392
1909	788,262	2,091,280
1910	741,078	2,272,846
1911	826,992	2,253,140
1912	999,704	2,609,638

The returns for 1913 are not yet available.

The increase in the number of domesticated birds may be noted as follows:—In 1865 there were only 80 in the Cape Colony. In 1875 there were 32,247, while the census of 1904 showed 360,830 domesticated ostriches in the whole Union, of which 79,670 were in the Oudtshoorn district, and the census of 1911 showed 746,736 birds, of which 110,578 were in the Oudtshoorn district. These figures show that Oudtshoorn justly claims to be the premier producing district in the country.

The domestic ostrich of to-day produces very far superior plumes than were obtained from the wild bird half a century ago. The reasons for this are not far to seek. The bird is by no means fastidious as regards the nature of its food, but the character of its plumage

is highly responsive. Instead of simply letting their feathered stock pick up a precarious existence on the veld, the enlightened farmers now cultivate as much land as can be brought under irrigation by gravitation and pumping, put it under lucerne and divide it into paddocks for the grazing of their birds, giving them at intervals "hard food" in the shape of maize and mealies, and also perhaps, if they have the means of so doing, giving them a spell of veld feeding. Large areas of fertile land are still awaiting cultivation, it is only a question of the future conservation of water. In England lately, an agitation arose in which South African ostrich farmers were charged with cruelty to the birds in the plucking of the feathers. With even more justice, cruelty might be urged against the sheep farmer in the shearing of his sheep. The fact is that the South African farmer knows that the ostrich is the goose that lays the golden eggs, and the bird is consequently more pampered than perhaps any domesticated animal.

Besides providing for careful feeding, the farmer has also applied himself to careful selective breeding. In our district, in natural response to the lucrativeness of feather production, the value of fertile irrigable lands has risen enormously, so much as 200*l.* per acre being not uncommon, and consequently the farmer finds that only birds of superior strain are remunerative.

Although undoubtedly ostrich-farming under favourable circumstances is a very lucrative business, the farmer of to-day has an uphill fight in coping with numerous diseases that have followed the domestication and breeding from finely selected stock. Undoubtedly the birds have lost that stamina for which they were so noted in the wild state, and being confined in large numbers in limited spaces, instead of roaming over the free veld, must tend to the fouling of the land and the propagation of bacterial germs. Domestic ostriches are particularly liable to a number of diseases, a large percentage being parasitic in their nature, and they take a heavy death toll. We estimate that only little over a third of the birds hatched reach maturity. Although no reliable data is available as to the longevity of ostriches, we know of instances in our district where birds of 30 and 35 years of age are still producing good feathers and still breeding. Birds through their reckless stupidity are very prone to meet with fatal accidents. Then there are plagues of caterpillars and eel-worm which attack the lucerne, and the parasitic fodder which is equally destructive, not to mention seasons of drought when expensive mealie feeding has frequently to be resorted to.

What Oudtshoorn produces.—Oudtshoorn feathers are mostly shipped over-sea through Mossel Bay. A quantity goes *viâ* Port Elizabeth and to other parts of the Union, and this quantity is about equivalent to the quantity shipped by neighbouring districts through Mossel Bay, so that the shipping returns at Mossel Bay practically show the quantity and declared value of feathers grown in Oudtshoorn. The following return has been supplied to us by the Mossel Bay Chamber of Commerce.

Year.	Weight.	Value.
	Lbs.	£
1911 - - - -	362,007	981,387
1912 - - - -	455,744	1,100,843
1913 - - - -	535,952	1,248,108

Markets.—The principal ostrich feather market is, of course, London, but it is not exclusively so. The following table shows the quantities and values exported to different countries.

	1907.		1908.		1909.		1910.		1911.	
	Lbs.	£	Lbs.	£	Lbs.	£	Lbs.	£	Lbs.	£
United Kingdom -	574,331	1,728,370	599,327	1,531,067	715,691	1,724,529	678,165	1,931,573	721,610	1,850,195
Other British Possessions.	1,039	4,698	1,133	4,115	1,999	9,321	1,724	8,335	3,896	21,697
France - - -	55	220	49	633	609	4,331	1,580	20,503	1,888	8,042
Germany - - -	8,892	10,525	7,370	5,189	10,867	15,201	9,717	22,289	20,870	42,639
United States - -	14,027	70,377	29,930	197,266	58,941	337,813	46,347	288,806	77,869	327,899
Other Countries -	14	45	6	122	155	85	515	1,338	859	2,668
Totals - -	598,358	1,814,232	637,815	1,738,392	788,262	2,091,280	741,078	2,272,846	826,992	2,253,140

The detailed figures for 1912 and 1913 are not yet available, but the total export for 1912 was 999,704 lbs. valued at 2,609,638*l.*

The Committee would be pleased to obtain an expression of opinion from the Commission as to whether anything can be done by the exhibition of feathers, or by other advertisement in the cities of the Dominions with a view to advertising the product of this district, considering that the danger of overproduction so frequently asserted should at least receive some forethought, and every possible endeavour made to extend the markets for the consumption of the supply of feathers.

The following table shows the total quantity of feathers offered for sale at public auctions on the London market during the past seven years, up to the end of 1912 (last year's figures not yet being available) : the total prices realised ; and the average price per lb. for each of the given years :—

Years.	Quantities.	Total Prices realised.	Average per lb.
	Lbs.	£	£ s. d.
1906 - - -	495,400	1,054,000	2 2 6½
1907 - - -	493,164	1,118,000	2 5 4
1908 - - -	581,000	1,225,000	2 2 2
1909 - - -	635,413	1,430,000	2 5 0
1910 - - -	663,000	1,679,000	2 10 8
1911 - - -	666,400	1,465,000	2 4 0
1912 - - -	690,000	1,625,000	2 7 1

There are, of course, considerable fluctuations in the market, according to the demands and changes of fashions, and these affect both buyers and producers on this side. At the present time the market is suffering a severe decline.

The Commission is asked to take note that this district has been singularly favoured by nature, both as regards climatic conditions and the great fertility of its soil, which allows of luxuriant lucerne growing wherever the surface can be irrigated, for the breeding of ostriches of the finest strains and the production of feathers of excellent quality.

Tobacco.—The subject of tobacco is approached with an appreciation of the fact that we are on entirely different ground from that covered in our remarks on ostrich feathers. There has practically been no oversea export of tobacco from South Africa up to the present time, and even were this not so there are no recognised public auction sales of the product in the United Kingdom, the practice being for tobacco to be sold by brokers in private treaty. Experiments have been made on a small scale but the results have not been encouraging. Nevertheless, considering how enormously the production of tobacco in the Union could be increased, it would be folly not to anticipate future more successful developments.

Confining ourselves for the present to the district of Oudtshoorn, we find that the census enumerators table in 1891, 34,186 lbs. ; in 1904, 1,214,324 lbs. ; and

in 1911, 1,085,928 lbs. These figures must be taken to represent what was in stock with the tobacco farmers and the tobacco merchants in the district on the dates upon which the census was taken, and do not, in our opinion, represent the annual output. We consider that the present annual output could be set down at 2,500,000 lbs., in spite of the fact that lucerne has to a considerable extent usurped tobacco lands.

The census of 1911 set down the total tobacco production of the Union at 14,961,199 lbs., Oudtshoorn being far away the largest producing district in the Cape Province, which showed a total of 3,767,179 lbs. Transvaal Province totalled 7,701,774 lbs.; Natal, 2,685,037 lbs.; and Orange Free State, 807,209 lbs. The largest producing district in the Transvaal was Rustenberg with 4,241,395 lbs., and the next Krugersdorp with 1,039,505 lbs.

There were 9,149 morgen of ground in the Union under tobacco cultivation (a morgen is roughly equal to 2 acres), the distribution being: Transvaal, 5,431 morgen; Cape, 2,084 morgen; Orange Free State, 1,132 morgen; and Natal, 502 morgen. This district had 584 morgen under such cultivation. Rustenberg, 3,152 morgen; and Krugersdorp 609 morgen.

Imports and Exports.—The imports of tobacco during 1912 were:—Cigars, 134,962 lbs., valued at 54,479*l.*; and cigarettes, 246,685 lbs., valued at 76,414*l.*

The exports were:—48,051 lbs. of unmanufactured, and 92,978 lbs. of manufactured goods, besides cigars and cigarettes, bringing up the total exported tobacco to 153,475 lbs, valued at 12,361*l.* The South African cigarette is a product which has only during late years become an article of marketable importance.

Experiments with Turkish tobacco have been made in the Cape, Stellenbosch, Paarl, and Tulbagh districts, but we are not prepared with any evidence on this branch of the subject. The locally-grown tobacco is used for fillers of cigars, cut (for pipe smoking), and roll tobacco, the latter being a staple article in the tobacco trade all over South Africa, and especially on the mines, where, perhaps, an even greater quantity is used for chewing than for smoking purposes.

A large percentage of the tobacco grown is used in the form of "dip" for the treatment of "scab" in sheep and goats. The essential ingredient in tobacco dip is the nicotine, the Department of Agriculture holding that to be thoroughly efficient the dip should contain not less than 8 per cent. nicotine. Oudtshoorn tobacco, or rather that grown in some parts of the district, contains a higher percentage of nicotine than that grown in any other part of the Union, the analysis over a large number of samples showing an average of about 4 per cent. nicotine. Dr. P. Daniel Hahn, of the Chemical and Metallurgical Department of the South African College, says: "Such tobacco is simply "too strong for smoking, and also unfit to be used "for making snuff, mouth-snuff, or roll-tobacco. One "cannot help thinking that nature has evidently "destined such tobacco to be used for producing a "most effective sheep dip or insecticide."

A considerable quantity of nicotine for sheep dip is imported from Austria and elsewhere, and the establishment of manufactories in the Union would obviate this, keep the money in the country, and help the labour market. We understand that it is contemplated to establish such a factory as we have alluded to here in Oudtshoorn. The aim of this factory will be not only to supply the whole of the Union with tobacco dip, but also to export nicotine to other countries where there is a keen demand for the commodity, not only as a sheep dip but for the spraying of vines and fruit trees, nicotine being one of the most effective insecticides known.

The committee offers to the Commission the oral evidence on ostrich feathers of Mr. E. T. L. Edmeades, one of our leading ostrich farmers, and Mr. A. E. Martin, of the firm of Sciama & Co., one of the largest local buyers, a gentleman of eighteen years' local experience; and on tobacco, that of Mr. R. F. Chambers, who is both a grower and manufacturer, and Mr. Karl Schenck, formerly the Cape Government tobacco expert, a large purchaser and manufacturer.

The committee will also have much pleasure in conducting the members of the Commission over ostrich and tobacco farms and through feather rooms and tobacco factories.

4081. **(Sir Rider Haggard.)** Will you please tell us what is your experience about ostriches. Are you an ostrich farmer yourself?—Yes, close on thirty years.

4082. We have read with great interest this very excellent memorandum which has been furnished to us and I think the best thing I can do is just to go through the main points. It seems from what you say here that lucerne is one of the great ostrich foods?—Yes, it is the chief food.

4083. You grow a large proportion of lucerne in this district?—We grow more lucerne in this district than in any other part of South Africa.

4084. How long do you keep your lucerne plant?—The plant will stand for a hundred years, it has been known to do so in other countries. I have a couple of fields which have been down twenty-five years, but it is not advisable to keep it for so long a time because other plants, such as Bermuda grass, known as quick grass, grow up, so that it is not advisable to let it grow longer than six, eight or ten years without ploughing.

4085. You mean that quick grass ultimately kills it?—Yes, but if you continually crop lucerne I think it would overmaster the quick grass, but we graze in this district, almost all our lands are pastoral lands, we only cut the surplus, we make lucerne hay to store for winter food and when we have a surplus we sell it, but most of the stuff grown in this district is consumed in Oudtshoorn.

4086. What does your lucerne hay sell for?—From 3*s.* 6*d.* to 4*s.* per 100 lbs.

4087. Is the soil deep?—Yes. Most of the valleys here are suitable for lucerne, because they contain the quantity of lime and potash which is necessary. Taking the soil along the Oliphants River Valley you have more than 20 feet of alluvial soil, the accumulation of millions of years washed from the Karroo.

4088. How would you describe your soil, is it a mixed soil?—Yes, decomposed stone. I do not think there is much granite in it.

4089. I suppose it is largely composed of boggeveld from the Karroo. Do you require to manure it?—We rarely manure it in this district except for tobacco.

4090. Is your land very valuable?—Very valuable indeed, and 200*l.* an acre or 400*l.* a morgen is very often paid for it, that is land along the river banks.

4091. Is that suitable for ostriches?—Well the richer lands on the river banks are all suitable. The land out on the flats is of a more shallow nature and would not command that price.

4092. Are those figures being maintained?—Yes, in fact there is no land on the market and there has not been any for a long time, every bit of land is snapped up.

4093. And there are many and eager buyers?—Yes.

4094. That is because of the value of ostrich farming as an industry?—Yes.

4095. Now about feathers. It appears that there has been a continuous growth in the weight of feathers exported, which in 1912 amounted to 999,704 lbs. Has that growth been maintained in 1913?—Yes, and more so. I think there has been a bigger growth and that we are gradually increasing.

4096. But there is a slump in the price to-day, is there not?—Yes, the last three markets in London have not been so good.

4097. What percentage of slump?—I should say now, judging by the market, that the price has gone down fully 50 per cent.

4098. Has that ever happened before in the history of the ostrich feather industry?—Yes, two or three times before, in 1885 and 1886 it was bad, and I think also in 1890 and 1896.

4099. And, therefore, you are not inclined perhaps to attach too much importance to it?—No. Of course, we do attach a certain amount of importance to it because we are producing more feathers, but on the other hand merchants are trying to find more markets. You will see a gradual rise in the number of birds and

the output, and still the stuff maintained its price in 1912, which was higher than was obtained years ago.

4100. Did it maintain that price?—Yes up to within the last three markets. I hope that this slump is only temporary. It may pass over in six months or within a year.

4101. But I presume that this increase of output is likely to continue?—Yes, so long as the ostrich feathers remain so remunerative and retain their price. It is the natural tendency for farmers to increase the number of birds and consequently the output.

4102. Is there no practical limit?—Yes, it depends on fickle fashion, there must be a limit some time or other.

4103. I think this might be a convenient place to ask you what is the limit of payability. At what return per bird does ostrich-growing cease to be payable?—I maintain that ostrich farming pays better at 1*l.* per plucking than wheat-growing in this district would pay.

4104. Then if it failed to return 1*l.* per plucking it would not pay?—No. I think not, as land is too high.

4105. You think it would still pay the farmer better than wheat-growing?—Yes, provided it does not fall below 1*l.* per plucking.

4106. The number of your birds is increasing very largely?—Yes.

4107. I see you give the total as 110,578 in 1911, and since then has there been a further increase?—There may have been, but I do not think very materially, because we have come to the limit of our land, the limit under cultivation at present. There is a large quantity of land waiting irrigation, but we are waiting for the conservation of the water. We have practically come to the extent of our irrigable lands in this district at present unless we go in for large storage reservoirs.

4108. Most of the land in this district upon which ostriches are reared is irrigated?—Absolutely.

4109. How many irrigations a year?—That varies. Along the Oliphants River in some parts you can get two cuttings of lucerne with one irrigation; it only takes from four to five weeks to get a crop and you can get two crops in some parts of the Oliphants River. Other parts will want watering for every crop, and in some parts where the land is very shallow as much as two waterings per crop, but taking the average run of land in this district giving four waterings of 4 inches each, it would be ample for the district taken as a whole.

4110. Where does the water come from?—From the mountains surrounding us.

4111. Is it stored?—No, all our farms are irrigated by gravitation and in few instances by pumping. I may tell you that the rainfall in the town itself is approximately 9 inches, but on the mountain tops which feed our rivers the rainfall is anything from 16 inches to 25 inches, and may be as high as 30 inches per annum, and for eight months in the year we have a fairly good supply of water. About four months in the year we are rather dry. Suppose a thunderstorm was passing in the Zwaartberg Mountains, the rivers in that area would flow down and most of the water would be probably absorbed in that area, and unless the flow was large very little would reach the Oliphants River.

4112. But if you irrigate simply by means of furrows it must mean an enormous amount of water running to waste?—Yes, that is just what we have been trying to impress upon the Government for years past, the importance of the conservation of water. Many people unfortunately rather mix up irrigation with conservation of water. Irrigation only follows after conservation. In this district we have done practically everything that we can from natural sources, but what we do want now is large storage works. I may tell you that the Government has surveyed three large dams, the smaller one is being constructed near Calitzdorp at the present time, and of the other two large storage sites one of them is at Tooverwaterspoort and the other is on the Kamnatie River. The one at Tooverwaterspoort could bring 9,000 morgen under cultivation. At the present time the Government is taking readings by means of the gauge weir and examining the deposits of silt and other things. Then the other site on the Kamnatie River when built would contain sufficient water for 7,500 morgen, giving that 7,500 morgen four waterings a year of 4 ins., but these are large works.

4113. Have you estimated the cost?—I think the one could be built for 150,000*l.*

4114. And the other two would probably cost half a million?—I think less.

4115. Do you propose that the Government should do this?—That is an open question. Myself and others think the larger works should be undertaken by the Government.

4116. Now, how do you propose to repay the Government?—By charging for the water which is used by the individual irrigator. This country being under Roman-Dutch law, only that land abutting on rivers is allowed the use of the water, but under the new Irrigation Act, which was passed three years ago, the Government have now the right to take the storm-water or surplus water over and above what the present irrigators are using, and storing that water, and may use it on other than riparian land. Now the Government at present do not feel disposed to undertake these works themselves, they are trying to force it on the people of the country to do it themselves, but where you have complications, such as you have in this district, and where it is not clearly proved in regard to one tributary having its source in the mountain and falling into the main artery, in how far the owners of land on that main artery have a right to participate in the water from one of these tributaries, it is a most difficult question. All these things would have to be inquired into. I think myself that the larger reservoirs should be constructed in this district by the Government. If the Government of the country can build railways and harbours, I do not think there is anything to prevent them from building irrigation works on a large scale, but they do not seem inclined to do so. They want to shift the responsibility on to the people, but where you have such large irrigation works, and where so many conflicting interests are bound up, and where the farmer on the tributary would not care to become joint security for the farmers three or four or five miles down the main artery, I think it is a matter for the Government to take up. Provision has been made in the Irrigation Act for forming water boards. The whole question, however, is one of the most difficult problems in a district like ours, and I am afraid it will not be easy to get the people in this district to be willing to pass mortgage bonds to the Government for the security of the capital.

4117. That is a matter for you to settle with the Government?—Yes.

4118. Am I right in understanding that the present position is this. An enormous amount of water is running to waste which might be conserved?—Yes.

4119. And that all the land which can be brought under irrigation under your present system is already under irrigation?—Practically all.

4120. Therefore the industry is now limited by these conditions?—The Outshoorn District is practically limited by these conditions.

4121. But if some system could be devised by means of which the water could be conserved and stored up in dams, the amount of land which would be irrigable would be largely increased?—Yes.

4122. Could you say to what percentage?—It is difficult to estimate that without surveys, but, as I said, the Tooverwaterspoort scheme would bring 9,000 morgen under irrigation and the Kamnatie River 7,500 morgen.

4123. How many morgen have you now under lucerne in the Oudtshoorn District?—I cannot answer that question without statistics, but there are about 20,000 morgen on the Oliphants River.

4124. Have you anything further to say about the food of the ostrich?—The food of the ostrich in this district consists almost solely of lucerne, and for our breeding birds we feed them on grain, mealies, barley, oats, &c., &c.

4125. Is that their natural food?—No. Their natural food is the ordinary bush and shrub of the veld.

4126. Which do they do best on?—On the lucerne and grain.

4127. I see here in your memorandum you mention that the ostrich farmers like to run the birds on the veld if they can?—Yes, for a change, and to pick up stone and lime, and so on. We also supply them largely with bone.

4128. I gather from what you say that your ostriches are doing well?—Yes.

4129. I observe further that you have a certain amount of disease?—Yes. That is owing to keeping such a large number of birds in a limited space. For the last fifteen or twenty years we have found it more difficult to rear the young birds. We have parasitic diseases such as the ordinary known worm, one in particular which is similar but smaller than the wire worm in sheep. They carry off quite a number of birds. In fact we estimate that only about a third of the birds which are hatched come to maturity. When once the bird is over the eighteen months or two years' stage they are very hardy, and they live to any length of time.

4130. Then it is owing to infantile mortality that you generally suffer?—Yes.

4131. Do you think you will be able to devise means by which this high death-rate can be lessened?—That is one of the things again that the agricultural unions in this country have been repeatedly impressing on the Government, the necessity of putting a man specially on one side to study the diseases of ostriches. We have one man in Grahamstown who has tackled the question in a way, but the loss is very severe, and I do not think they have struck the proper way to cure this mortality in young ostriches.

4132. To what age do these ostriches live?—We have no data on that point. Formerly an ostrich was simply an ostrich, but these last fifteen or twenty years we have bred them by selection so as to be able to obtain the finest strain, the same as with cattle and horses. That has been done to improve the quality of the feather. Years ago we did away with the old ostriches, but now, when we are quite sure that we have good blood in our stock, we keep them as long as they will breed. We know of birds which are capable of being used for breeding purposes up to thirty years of age, and we shall be able to find out in time how long such birds will live.

4133. They have a very long life?—Yes.

4134. You consider that you can produce as good or better feathers in this district as are produced in any other part of the Union?—I am of the opinion that this district produces the best feathers in the world. There are two reasons. In the first place we have the soil, and we have been longer in the business than other people. I do not put it down entirely to the soil, but we have had a long start in this district, and we have devoted a good deal of attention to selection and breeding. The soil and the climate here are all that can be desired. The soil in the Oliphants River Valley is a very soft kind of soil and does not contain that hard grit that some of the red soils contain, and the consequence is that when the feathers come into contact with the soil they are not injured to the same extent as they are in the case of a hard gritty soil. Besides that the drainage in this district is excellent. When water is put on the land it simply sinks away through the soil, and does not lie on the surface very long. Birds are kept away from water as much as possible.

4135. You have a small rainfall here?—Yes. You do not require a big rainfall, especially when feathers are full grown. The rainfall would naturally deteriorate the feathers, and as we only have a rainfall of 9 inches that tends to improve the lustre of the feathers.

4136. So every condition which the ostrich requires is present here?—Yes.

4137. And that has made it so successful?—Yes.

4138. What is your chief market?—London.

4139. I see the average price per lb. of feathers in London is 2*l.* 7*s.* 1*d.*, or was in 1912. Is that mixed?—Yes, that is taking the whole lot for the year in the Union.

4140. But that has been largely decreased in the last few markets?—Yes.

4141. We have heard it said sometimes that this plucking of ostriches is a cruel business. Is that so?—No, that is an absolute fallacy which we have tried to dispel from the minds of people in Europe.

4142. What is the exact process of plucking and how often does it occur?—After the chicken is hatched it takes about nine months before the first feathers are ripe and fit for plucking, or otherwise you clip at seven months and extract quills two months later, thereafter every eight months. The process of plucking is as follows: The bird is caught round the neck by a kind of shepherd's crook; as soon as he is caught one man takes hold of him at the tail, and one at each wing. He is then led into a triangular arrangement and the feathers are then removed, the wing or white feathers being clipped and the rest extracted by hand.

4143. Do you cut the feathers and let the stumps fall out?—No, we only cut the wing feathers, and pull out the stumps two months later when they are ripe. We use a pair of pliers to draw them. It is practically painless just the same as cutting your nails. The reason why we cut the white or wing feathers two or three months before they are ripe is to preserve the points. If you allowed the feather to remain on the bird for eight months, by the time those eight months were over the points would be completely spoiled.

4144. Do you take any steps to advertise your business?—No, not the farmers.

4145. Are you contemplating any such step?—There is some talk of doing it. As a matter of fact I had a circular sent to me the other day. To my mind it is questionable whether it is the farmer's duty to advertise his feathers seeing that the sale of them is spread over such a large area. You would find so much difficulty in combining to pay the expenses of advertising. We take it to be a part of the duty of the large manufacturer and buyers on the other side to advertise the feathers. They buy and manufacture the feathers, and as business men they have agents and travellers in all parts of the world, and therefore, for their own sakes, they would naturally advertise if they considered it necessary. They are the right people to advertise. Nevertheless it is a matter to be considered whether it would be advisable for growers to take up this question or leave it in the hands of the manufacturer.

4146. Have you any co-operative association for selling the feathers?—No.

4147. What happens with the feathers? Do you send them to the market yourself?—No. I myself do not send them to the London market. Feathers are sold here by different systems. One is on the basis of tenders. That is you get a dozen or more buyers to come together and they each put in a tender in the same way as sugar is sold in Natal, and these tenders are opened and the highest tenderer gets the parcel. On the other hand, some men have special buyers to whom they sell all their feathers, and, again, others sell feathers as a speculative business, receiving so much per bird.

4148. Are you satisfied with your present system?—We have been satisfied. There have been one or two objections, but seeing that some of the largest buyers have closed down for the present there is now a move on foot to form a society to ship our own feathers direct.

4149. Do you contemplate co-operative action?—Yes.

4150. Is there any other point you desire to lay before us?—No, unless there is anything you wish to ask.

4151. **(Sir Jan Langerman.)** Talking about the value of land, which you say has been sold at 400*l.* a morgen, what would be the average value of your irrigable land?—It is so difficult to say at present. There is no land on the market. If there was a great slump we do not know what would happen, but at present there is no land on offer whatever. Any small pieces of land which have been put on the market have

been snapped up by the people owning adjoining properties. The farmers who have money, instead of putting it into investments or mortgages prefer to put it into land, and so they do not care what they pay—within reason.

4152. You say land has been bought at 400*l.* a morgen; assuming this to be the average value of the land, and eliminating ostriches, would the land be worth that figure for tobacco or fruit?—Yes, for tobacco certainly. In fact, leaf tobacco at from 6*d.* to 8*d.* per lb. would be almost as remunerative as ostriches. I have made as much as 135*l.* out of a morgen of tobacco, including what is known as the "na-twak" or second crop.

4153. There is no question, then, that if ostriches should fail you could make a good living out of tobacco and fruit?—Certainly. You could grow fruit for export. Our grapes, I believe, are superior to anything in the Cape Province. I do not think there need be any anxiety. We have the lucerne to feed the cattle and keep sheep. We could keep tens of thousands of sheep with small quantities of lucerne. Even if ostriches became absolutely unsaleable, I believe that the best part of this district would still be good.

4154. Taking it that all the land you could irrigate yourselves is already taken up, at what price could the Government buy land to-day which cannot be brought into cultivation by natural sources of water supply, but which might be brought into cultivation by the Government if they went in for a large settlement scheme?—I may say they have tried it several times, but it has never been carried out, nor can it ever be. The idea of the Government in regard to future schemes, I think, is not to buy the land, but to charge the people for the water. I do not think there would be any chance of buying up the land, because they would find the people unwilling to sell.

4155. There is no opportunity then here for newcomers to secure small holdings at a reasonable figure?—No, the land is too expensive. In fact, my opinion is that irrigable land in this district would be far too expensive for the Government to place immigrants upon it. There are so many more suitable places along the coastal belt where the rainfall is ample without irrigation.

4156. You have a close corporation among yourselves?—Yes, and there is no room.

4157. You said that the Government should undertake large schemes; do you know what the people in Robertson have done lately?—Yes.

4158. What have they done?—They have combined and made the Robertson Canal, which, after all, is what we have done here for years past. They have now undertaken the Breede River scheme, and there the Government has offered to assist by building a reservoir.

4158A. They have guaranteed them something like 400,000*l.*?—I believe so. The difficulty here is the existing rights. Wherever you start new irrigation works you are able to do it. But here you have the existing rights which you would find it difficult to upset. Our people are very conservative, and they know what they have. The existing rights are the difficulty, which you have not to contend with in Robertson. We stand unique as a district.

4159. **(Mr. Garnett.)** How many birds do you yourself have?—Just over 1,000.

4160. On how many acres are those run?—I reckon about six birds to a morgen—or three to the acre. But when I say six to the morgen I should point out that for every 100 birds you keep you can also keep ten or twelve head of cattle, and a couple of horses to graze on the stubble and grasses in the fields. The birds only take the leaves and the tender tops, so you have an enormous quantity of food left for stock, and also sufficient to make hay for the winter feeding of the 100 birds.

4161. How many cuttings of lucerne can you get?—In this district our water supply is erratic, but you can from one field have five cuttings. Your first cutting in October would be rather mixed with grasses, but after that you could have a cutting every six weeks. Some years ago the Government wanted information on the subject, and I irrigated a field of seven morgen and put on it 490,000 gallons of water per morgen. I irrigated on the 1st November, and on the 30th November I cropped it, and after two weeks, when the lucerne was dry and ready for storage, I got 35,000 lbs., that is, about 18 tons of 2,000 lbs., or 5,000 lbs. per morgen. That is 2½ tons to the morgen.

4162. What is the average price for good ostriches?—You can buy a full-grown ostrich for 1*l.*, and there are birds you could not buy at 500*l.*, according to quality and blood, and if you wanted a pair of fairly good birds I am safe, I think, in saying you could not get them under 100*l.*, and, to prove that, there was a sale here about one month ago at which 26 pairs of ostriches realised over 3,000*l.*, an average of over 100*l.* a pair; in fact, I bought one pair at 70*l.* odd, and another pair at 90*l.*, and one pair was sold for 290*l.*

4163. Those are current prices?—That happened a month ago, even with this drop. No owner of good birds will sell for much less than 100*l.* a pair.

4164. I suppose, in order to avoid fouling the ground, it is necessary to give constant change?—Yes, if you can. It is difficult to do it, our land being so limited. That is the reason why some of our farmers have gone to other parts of the country to practically new lands, where they hope to be able to breed and rear a larger percentage of ostriches than we can here on our limited area.

4165. Given a certain amount of land, is it better for the birds that that land should be divided into large enclosures or small enclosures, so that the birds may have more frequent changes?—The more changes they can have the better. The farms here are all divided into 5, 10, 15, or 20 morgen paddocks. You irrigate your one field, and three weeks after you have irrigated you put your birds into it, and the birds graze until you consider the food is all finished, and then you shift them into the next camp, and so on in rotation, following up with cattle and horses and sheep and other stock.

4166. We find in England that in regard to poultry, for instance, constant change is better and more beneficial than extensive range?—Yes, you see all our land is divided into paddocks.

4167. You mentioned a great many alternative crops other than lucerne that might be grown—fruit and tobacco, and food for cattle. All this is dependent on irrigation?—Yes.

4168. Have you trouble with your water rights?—Yes, sometimes. But the water rights in this district are practically all settled by arbitration and by judgments of the Supreme Court, and by understandings.

4169. In the case of an irrigation scheme abstracting water from the tributary of the main stream, are the riparian owners on the main stream entitled to compensation?—No.

4170. Cannot you impound the head waters of any tributaries?—Yes, provided you do not injure your lower neighbour. But if you do that, of course, you are running up against a stone wall, so to speak.

4171. **(Mr. Campbell.)** This drop in ostrich feathers, do you consider it is due in any sense to over-production, as far as you know?—You can see from the returns how the production has been going on, and how the merchants on the other side have been finding new markets and outlets for the production. We have had one or two drops before, but I daresay the business is rather dependent on fashion. You know there was a great agitation some time ago in regard to cruelty to animals, and that may have affected the trade to some extent. Then we think, also, that the manufacturers of ribbons and other hat decorations are probably pushing their trade as far as they can to the detriment of ostrich feathers. So it is fickle fashion we have to depend on. I have no doubt, however, that the day is not far hence when the ostrich feather will again be largely worn, and you must not forget that the hats now worn by ladies are not so large as formerly, and a small hat will take no feathers. When the large hat again comes into fashion, I think we shall be practically the same as before. Another thing is that boas have not been worn for some years.

4172. You do not think that the over production of feathers during the last few years has had any effect?—No, not a serious effect, because up to the last three markets the feathers have always sold well. What has affected the market very largely, in my opinion, is that some sellers have held back their supplies, and these supplies have been accumulating rather heavily on the other side, and this naturally tends to reduce the price.

4173. In the marketing of the feathers, do you know of, or have you heard, any suggestions that the feather market is controlled by any combination of feather dealers?—No, I think the feather market in London is in fair competition with the world's buyers. I do not think there is a possible chance of a combination. There may, of course, be one or two large buyers who may say, "We are not going to buy to-day," and that will, of course, affect prices for that day, but seeing that you get buyers from France and America, and all over Europe, and elsewhere, I do not see that it is possible for there to be anything in the nature of a combine to rule the prices obtaining in the London feather market to-day.

4174. Does the price you receive as growers correspond fairly regularly to the retail prices of feathers in the retail markets of the world, as far as you know?—We cannot say.

4175. There should be some ratio?—No, unfortunately there is not. I have never met the man yet who could tell me the actual value of a prime ostrich feather. They vary so much, and opinions are so different. It is just as a man's eye strikes the feather that he estimates its value. Even the expert cannot say.

4176. Is the grower at the mercy of the man who is buying as an expert?—No, I do not say so.

4177. The farmers themselves surely have some expert knowledge?—I do not think anybody knows. I do not think even the man who supplies the market knows.

4178. Not even as a rough generalisation?—There is no standard of value for an ostrich feather. It is merely the value which the individual buyer places upon it.

4179. But in breeding ostriches for the production of feathers, surely you try to aim at some specific ideal?—Yes, we all aim at a long broad thick flue and a glossy feather. This ideal is not always attained, but that is our aim. We aim at a fine large feather, running evenly up—a thick feather, with heavy flues, and with a sort of silver gloss shining on it. That would be an ideal feather.

4180. Well, now, looking at that standard, you could not give any general idea as to whether the average price of a standard feather of that type bears a constant relation to the average price at which it is sold in the markets of the world, so as to find whether the price which you get is a genuine price or is controlled by somebody else?—Naturally, we know that some of our farmers have sold feathers at ten and twenty shillings apiece, but those would be picked feathers, and, of course, the man on the other side would sell them in ratio.

4181. But you have no reason to suppose that there is any combination, like there is, for instance, with diamonds?—No, I do not think so. There may be combination here and there, but I think, speaking generally, the farmers in South Africa have been very satisfied with their returns and their treatment at the hands of the buyers. Both farmer and buyers have made money, and if the farmer gets a good price, he is willing for the next man to get some return. After all, even the middleman has to live. The farmer has to produce, the middleman has to find the merchant, and the merchant the market. If you do not leave a margin for the merchant he cannot speculate. I think up to now we have been fairly satisfied.

4182. In reply to Mr. Garnett, you gave the average number of birds per morgen as six?—Yes.

4183. Does that apply to these very high values of land, or is it greater there?—That is the average for the Oudtshoorn District. In some places you cannot get that number of birds, and some of our farmers do not keep that number on a morgen of ground, but taking the ordinary average farm, you could comfortably keep six birds on a morgen, and have sufficient food-stuff for winter food.

4184. Speaking as a practical farmer, would you buy land at 200*l.* an acre for ostrich-farming?—Well, I prefer to sell it.

4185. I suppose the high price of birds, and the capital needed for the business is so great that the small holder would not have much chance?—No, it is almost out of the question, although we do have small owners with 15 and 20 birds, but then they have had the land. I do not think it would be a wise policy for any small holder to buy land at the prices prevailing here.

4186. Could you say roughly what is the average number of birds kept by individual holders in this district?—It would be hard to say. We have five-morgen lots, and ten-morgen lots, and 20-morgen lots. The size of the holdings varies so much.

4187. What would be the average number of birds an ordinary farmer would keep?—According to his land. As I said before, six to the morgen.

4188. You could not say whether the average farmer would keep 100, 200, or 300?—The whole district is devoted to ostriches.

4189. But there must be some general average number of birds that each farmer runs?—It all depends on how many morgen of land he has.

4190. There must be some means of striking an average?—We estimate that there are 110,000 birds in the district, but I do not know how many farmers. One firm of farmers runs 7,000 birds.

4191. You could not say generally whether the ordinary farmer's average would run to 200, 300, or 400?—There are many with 500.

4192. Would you say 500 was the average?—No, that is too large.

4193. Well, 400?—That would be too large. It is most difficult to strike an average, but reckoning so many birds to the morgen would give you the best idea. I would not like to answer that question.

4194. Is not dairying one of the possibilities of the district?—Yes, a very great possibility.

4195. Would it be profitable?—Yes, a dairy business in this district would be quite profitable.

4196. And that business could, as a general thing, be carried on fairly well by small-holders?—Yes.

4197. Is there any possibilty, by means of irrigation of extending the dairying business?—There is a small amount of dairying carried on. The farmer makes his own butter here and sells a little. But ostrich-farming has paid so well that the farmers have devoted their attention to nothing else, except tobacco.

4198. But is it not a fact that dairying is one of the great needs of South Africa to-day, and is it not one of the industries that could be carried on here?—Certainly. But we are not philanthropists. A man produces the thing that pays him best.

4199. But I am merely questioning you as to whether there is any possibility of making use of additional land, by co-operative action or Government assistance, or other organisation, for carrying on dairying, which is such a necessary business in this country, judging by the imports of dairy produce from oversea?—If prices of feathers went down very much more, I am sure that dairying would take a place here. I make quite a lot of butter myself, but we have no co-operative dairies.

4200. Dairying not being subject to fashion, would it not be more reliable?—No doubt it is reliable, but as I have said before, in the past the ostrich industry has paid so well that farmers have found it better to devote their whole time to it.

4201. I am not speaking of the individual farmer. I am considering the matter from the standpoint of the Government carrying out these large irrigation schemes and forming settlements in the future, whether it would be a better policy to enter on ostrich-farming or dairying, having regard to the future outlook and the economic needs of the country?—Dairying unquestionably would be good, and I hope the day is not far distant when we shall make sufficient dairy pro-

ducts to supply the needs of this country. But when you have an article that brings in a bigger return you are not going to make butter for the sake of the country when it may mean a loss of 500*l.* a year. I do not think it is possible for the Government to carry out these small settlements in this district.

4202. You have possible irrigation schemes in this District?—Yes.

4203. Looking at the matter from the point of view of the economic needs of the country and the profit from the industry would it not be better in commencing these schemes to go in for dairying?—While ostriches pay well, dairying would not be carried on on a large scale.

4204. You do not think that dairying could compete with ostriches at the present time?—No.

4205. Is there any great margin of difference between the two?—When ostrich feathers come down very low we might consider dairying.

4206. With regard to riparian rights. Could you say whether under Roman-Dutch Law the riparian rights of the owner extend to irrigation?—Yes. The riparian rights are first for domestic purposes and then for stock and then for irrigation in equal divisions.

4207. Could a man take a supply for irrigation purposes so as to disturb the flow down below?—As long as he does not interfere with the supply for domestic and stock purposes.

4208. What about the lower owners' riparian rights in regard to irrigation?—In this district I may tell you that all these questions have been settled by judgment of the Supreme Court and arbitration.

4209. And the judgment has decided that the owner has irrigation rights?—Yes, but he cannot deprive his neighbour lower down who has his rights too. Where there are, say, ten or fifteen holdings on the river all entitled to water, the water would be divided in proportion to the land each one held in rotation.

4210. **(Mr. Sinclair.)** Is the Commission to understand that apart from a system of Government conservation of water you are about at the limit of your feather production in this district?—Yes, I think we have brought practically all the land under irrigation that can be irrigated by means of gravitation. There is a little that could be brought into use by pumping, but the water supply is so erratic. We have come to the limit, practically speaking, without the conservation of water.

4211. So that if the industry is to extend you must look for a Government system?—Yes, or help in some direction. It might be done by private enterprise, but it is a big scheme and there are many complications.

4212. You think it is too large a scheme for private enterprise?—Yes.

4213. You have told us the position as between yourselves and the Government. Is the suggestion that, owing to the high cost which is necessary, the undertaking is prohibitive?—I do not think they have made any suggestion. I may tell you the Government has not yet finished the whole of the surveys. The survey is still going on. They are going up the Oliphants River Valley. When once they have surveyed the whole of the irrigable land that is under water at present and which can come under water, I believe it would be the object then of the Irrigation Department to lay before the people for them to discuss some scheme for constructing large irrigation works, and to find ways and means of bringing all the available land under water.

4214. Then this survey is the first step?—Yes, I may tell you also that they have gauge weirs on the rivers at present and I do not think that it would have been advisable for the Government to take any action in the direction of these big schemes without sufficient data.

4215. One result of this preliminary inquiry will be to show whether the work is of such magnitude that it calls for Government assistance or whether it can be undertaken by private enterprise?—Yes.

4216. Now, roughly speaking, is the area that would be made available by a Government system or a capitalistic system of conserving water larger or smaller than the area already in use?—Smaller.

4217. Appreciably smaller?—Considerably smaller.

4218. Could you give us an idea of its proportion?—Possibly by two-thirds. That means that about one-third more could be brought under cultivation.

4219. And when that one-third has been brought under cultivation for ostrich-farming purposes you will have exhausted the possibilities of this district?—Yes.

4220. By a careful system of breeding and selection and the naturally favourable conditions that you have here you have produced a feather of the primest quality?—Yes.

4221. That has been the result partly, as I gather from you, of selection and partly it has been brought about by the favourable conditions of your soil and climate?—Yes.

4222. I wanted to ask you a question as to the possibility of the bird being improved in other Colonies, such as Australia. Have you been to Australia?—No.

4223. Are you of opinion that, this being the home of the ostrich, in another country it is not capable of being produced so as to furnish feathers of the first quality?—I should not like to say that, seeing that other animals and birds can do well in countries other than those which are their natural home. I may mention, however, that it is a thing very largely of breeding.

4224. Seeing the great improvement that you have been able to effect here by selection in the breeding of the bird, do not you think that the same process could be carried out under favourable conditions in other countries?—Yes, in the course of years. But it has taken us fifty years to bring it to the present state.

4225. Perseverance and selection, and care in breeding may achieve, at any rate within certain limits, what you have done in this district?—Yes, and the climatic conditions.

4226. By climatic conditions you mean, of course, plenty of sunshine and a dry surface?—Yes.

4227. Well you can get that in abundance in Australia. You said also that a soft soil was favourable?—Yes.

4228. It is less destructive to the feather?—Yes. If you get a hard gritty soil it injures the feathers and reduces their value. The birds are like ordinary fowls and are rather fond of rolling in the dust.

4229. I think you told us that only about one-third of the chicks that are hatched are reared?—Yes.

4230. They suffer from insect pests?—Yes.

4231. Has the State or the Government done anything to help you by investigating this insect life and devising means to destroy it?—Only in a very half-hearted manner. It has been impressed upon the Government for years past by Farmers' Associations at their annual conferences. The Government has been urged to inquire into the life-history of these pests.

4232. You suggest that the Government should undertake this work in the interests of one of the most important industries in this country?—Yes, with an export value of over 2½ millions.

4233. It would be a shocking waste, if it is preventable, that two-thirds of your chicks should perish from causes which might be avoided?—Yes.

4234. And you express that view as strongly as you can?—Yes, as strongly as possible, because in a good many cases I may tell you that farmers are keeping birds which are not up to the standard, and if it were not for these heavy losses they would destroy them, but they have to keep them in order to keep up their stock.

4235. Has there been any local co-operation in that direction among growers who are so largely interested?—Yes, I myself have been doctoring my birds for a long time. I think every farmer here tries to find out what is the matter with his birds and to save as many as possible.

4236. Have the efforts which have been made by private growers tended to reduce the rate of mortality among the young birds?—Yes, in some instances. Of course, there are many quacks going round selling this

pill and that pill, but there are one or two remedies given us by the veterinary surgeons which are very effective provided they are given systematically and with care.

4237. There is room for good work in this direction?—Yes there is room for a man to be specially set aside to look after this matter seeing that we export 2½ million pounds' worth of feathers annually. This man should do nothing else but discover the parasites which infest ostriches, and study their life-history.

4238. No doubt you are aware that in some Colonies the State appoints men to go round the country and to give instructions in various matters affecting the interests of the farmers and the country generally in order to obtain a better article and increase the exports?—Yes.

4239. And you want that done here?—Yes, although we are often told that the Government is doing everything for the farmer it is not doing nearly as much as other countries are doing.

4240. When I questioned you about the possibility of improving the bird in other countries, I wanted to find out what the people themselves could do by careful breeding to improve the birds, and it is quite evident from what you have told us that they could do a great deal?—Yes.

4241. They would be helped, of course, if you sent them some birds?—Yes, they would be helped too quickly. It has taken us fifty years to bring the bird to its present state and we do not want other countries to do it in five years.

4242. **(Mr. Bowring.)** Does it require much labour to take care of ostriches?—Yes, but not the same amount as is necessary to cultivate land for crops and for fruit and so on. But you need a certain supply of labour to irrigate your lands, and men also who are thoroughly acquainted with the work connected with ostrich-farming. New hands working with ostriches are a source of trouble. They get hurt themselves and they hurt the birds. You do not want the same number of men per morgen for ostriches as you do for working vines, fruit, wheat, or tobacco.

4243. Have you so many men per 100 birds?—A man generally keeps so many men on his farm all the year through. You see, we all have our shuts to keep clean and the dams to build up and so on, but a couple of men could very well look after 100 birds.

4244. A farm on which there are, say, 1,600 birds will probably require 20 men?—No, about 10 or 15.

4245. Are they coloured men?—Not all, each farmer, as a rule, has a couple of white men.

4246. About what wages do you pay?—I think the wages would run from 3*l.* to 4*l.* a month or say 3*l.* 10*s.* for a coloured man. And beside that they have their houses and other things free.

4247. What privileges do they have?—They have a free house and free wood and a lot of dairy produce such as milk, skim milk, and very often they have a small garden. The average wage for a loose man is from 2*s.* 6*d.* to 3*s.* a day.

4248. Do not white people get rather more?—Yes.

4249. Do they get a great deal more?—No, because after all the labour is unskilled and unless a man was in the position of a foreman he would not get much more. As a foreman he would get possibly 5*l.* or 6*l.* a month and considerably more if he takes full control. But for unskilled work, if he is equal to the coloured man, he would only receive a few shillings more.

4250. How many markets are there in the course of the year?—Six. There is one every two months.

4251. Because the statement here shows that the drop in prices has not been very great up to 1912 at any rate?—No.

4252. The price was 2*l.* 7*s.* 1*d.* per lb. in 1912. Previous to that the price was 2*l.* 10*s.* for the year 1910 according to this statement?—Yes.

4253. What is the price now?—That is rather difficult to say. It is rank speculation just now. Some of the largest firms are not buying and we have not got the return for the last London market. We cannot tell until we get the returns.

4254. Have you a fair idea?—I should think myself there has been a drop of 50 per cent.

4255. From 2*l.* 10*s.*?—No, but as far as I can judge the ruling price for feathers here is certainly 50 per cent. less than the price three markets ago. That is to say, that if a bird brought 8*l.* or 9*l.* then it is only bringing about 4*l.* now. I may say that the average return per bird is higher here than in other part of the Union.

4256. **(Sir Rider Haggard.)** Is it the tendency here for ostrich-farming to concentrate into fewer hands and to be carried on by the larger firms or otherwise?—It would naturally follow that where you have a community which is making money and the people do not invest their money in bonds and mortgages and Government securities they secure as much land as possible and wherever they can get land in their own vicinity the tendency is to buy as much as they can.

4257. Therefore it looks as though the small man were going to the wall?—In all industries it comes to the same thing. Where there is keen competition the man who is the strongest holds out.

4258. Is it so here?—It is so.

4259. What capital is required per bird?—That is difficult to say. It is generally reckoned that with your own land you can keep 100 birds on land that is worth 5,000*l.*

4260. You have to stock it?—Yes.

4261. Therefore, the remaining capital is the cost of the birds?—Yes, the birds may be worth 1*l.* or 30*s.*, or 100*l.* each. I may mention that the other day a man in this district died, and his estate had to be divided. The ordinary running troop of birds fetched about 12*l.* 10*s.* each. The first lot was something like 20*l.*, and the last something like 6*l.*, so you can say that possibly about 13*l.* is the average. These birds were not specially selected.

4262. Were they adult birds?—Yes.

4263. And yet you told me the average price was 100*l.*?—Yes, but that is for selected birds for breeding purposes.

4264. The average run of Oudtshoorn birds is considerably less?—Yes, the flock birds would average anything from 1*l.*, but good average birds would not be obtained for much less than 10*l.* to 15*l.*

4265. Do you fear the competition of other countries?—Naturally, when you have only frivolous fashion to depend on.

4266. Do you think that other countries could fulfil all the conditions which are necessary to successful ostrich-breeding, such as America and Australia?—If they had the blood perhaps they could.

4267. Does the price put on the article by the retailer in England, for instance, check the market. You know the retail purchaser pays a very different figure for it from what you get?—Yes, I have had the opportunity of going through the factories in England. There was a great scare some years ago about supply and demand. I was in England at the time and went through most of the warehouses and interviewed the manufacturers. I saw the processes which the feathers have to go through, and do not think that the prices charged for manufactured feathers are too high. In isolated cases, and for the very finest feathers, they would charge high prices. But you have to take into consideration the enormous quantity of manufactured goods in the warehouses of London, and one naturally supposes they are as anxious to get rid of the stuff at a profit as we are to sell, so I do not think that we have very much to complain of in regard to the system.

4268. Your answer is that the price charged by the retailer does not affect you?—I do not think so, very much.

4269. You were speaking about cruelty and its influence upon the feather-buying public owing to the very proper agitation which was recently created on the subject of cruelty to birds, egrets and so on?—Yes.

4270. Have you taken any steps to inform public opinion in England and America that the plucking of ostriches involves no cruelty?—Yes. Directly we received information that there was a probability of the ostrich being included in the Anti-Plumage Bill we had a meeting of our Association, and we wired to the Union Government Trades Commissioner in London

a very long cable, pointing out that it was an absolute fallacy to think there was any cruelty involved. As we pointed out, there are many birds in this district which could not be bought for 500*l.*, and is it likely that the owner of a valuable bird like that would treat it with cruelty? Since then I think the Trades Commissioner in London has made it thoroughly plain in all the European centres. I had a communication from him the other day in regard to one of the leading men in Paris, and he says that he was talking about the cruelty question in connection with the Anti-Plumage Bill, but he said it excluded ostriches, and, as you are aware, the English Bill will also exclude ostriches. But where you have the impression that cruelty is committed it is difficult to remove that impression from the minds of people, and I think our Trades Commissioner is alive to that fact, and is doing everything in his power to remove the impression if and where it exists.

4271. **(Mr. Garnett.)** Plucking is not a correct discription of what takes place, I understand. It is a misnomer?—Yes, in regard to the white feathers but not as far as the other feathers are concerned. There is no more, and indeed less, cruelty in this operation than in sheep shearing. The feathers are practically ripe at eight months and can be taken out.

4272. What are intervals between the pluckings?—We reckon three pluckings in two years.

4273. **(Mr. Campbell.)** Would the bird shed the feather if it were not plucked?—Ostriches are peculiar. They do not moult like other birds. When the feather is absolutely dead it comes away.

4274. You simply anticipate what would occur naturally?—Yes.

Mr. A. E. Martin, representing the Oudtshoorn Chamber of Commerce, called and examined.

4275. **(Sir Rider Haggard.)** You have heard the evidence of Mr. Edmeades?—Yes.

4276. Have you anything to say in addition? Perhaps you would kindly make a statement?—Regarding the price of lucerne ground, the highest price that I know of was 850*l.* paid for three quarters of a morgen sold in the Cango District.

4277. Why was such a high price paid?—The people had the money and they wanted the ground.

4278. What is the next point?—Regarding the figure at which it would pay a man to farm, I think it would pay at 1*l.* a bird, but not at 1*l.* per annum, as Mr. Edmeades stated.

4279. You mean at the rate of three pluckings in two years?—Yes.

4280. That would mean 30*s.* or more per annum?—Yes. In regard to the question of drought I know that on Mr. N. Fouchie's farm there had been no water for nine months and still the lucerne was about two feet high without any water at all.

4281. Owing to sub-soil water?—Yes. As regards the amount of ground under irrigation at the present time, tobacco stands at a very high price and lucerne ground is now under tobacco. If tobacco went down we might put it under ostriches, so we have not yet finished even all our present irrigable ground.

4282. You mean that you would replace tobacco with ostriches?—Yes. As regards the soiled feathers, in many cases, if we have severe weather, we get a large percentage of soiled feathers.

4283. Can you not wash them?—No, it is not safe because we have had complaints from the manufacturer. He objects, and the American Government, it is reported, once raised the question that if washed feathers came in, they would charge the manufactured rates, which, I think, was 50 per cent. In regard to to water boards, I do not think any District in the Union has spent more money over litigation in regard water rights than this District. Mr. Edmeades made a slight mistake when speaking of plucking. He used the term, body feathers. That does not really mean the feathers from the body of the bird. It means the feathers which lie over the white feather on the wing. We do not pluck the body.

4284. You only pluck the wings and tail?—Yes, and besides the primes and the floss, some only pluck the "biocs" from the wing and the "boos" from the tail. When the feathers are quite dry they are drawn from the wing. There is no blood, and there is no suffering inflicted.

4285. **(Sir Jan Langerman.)** What proportion of ground have you under lucerne, tobacco, and cereals?—Most of it is under lucerne, and the next largest crop is tobacco.

4286. Have you got water from bore-holes?—A little, but not much. The experts say it is a difficult formation to bore through. The water they have got has not been very good, but I believe it would be better if they went down deeper.

4287. **(Mr. Sinclair.)** As ostrich-farming is so profitable, why is so much of the ground used for tobacco?—The price of tobacco has been very tempting lately.

4288. Are the two crops comparable from the point of view of profit?—Yes, I think in time tobacco will pay better if the feathers go down very much in price.

4289. Is the land specially suited for tobacco?—Mr. Chambers will tell you more about tobacco than I can. In regard to putting people on the land for ostrich-farming, I may mention that a large number of people have left the land about here on account of this concentration of capital in a few hands.

4290. **(Mr. Campbell.)** Are you a buyer and shipper of feathers?—Yes.

4291. Are you charged a special rate of freight on feathers?—Yes, 1 per cent., the same basis as gold.

4292. Is that a very serious charge?—I do not think so, because they give us special care.

4293. In regard to feathers and tobacco, I suppose one could say that the tobacco market is extending in size and price, and that it is likely to continue?—I believe so.

4294. Is there any tendency for the population to concentrate in the towns?—It is a growing tendency. Originally they had vines and crops and other things, but there have been so many people going in for ostriches that it has been rather overdone. There is one farm on which a few years ago there were 101 registered voters, and I do not think there are 60 there to-day.

4295. Are those natives?—No, mostly white people.

4296. Generally speaking, the labour employed here is native?—Largely, but we must have some white labour also.

4297. Ostrich-farming is, I suppose, most usually carried on near the town?—No, wherever they can get irrigable land.

4298. **(Sir Rider Haggard.)** Did you suggest just now that those registered voters have flown into the town?—Yes, or elsewhere.

4299. Owing to putting the land under ostriches?—Yes.

4300. Is that going on generally?—It has gone on in several parts of the district.

Mr. R. F. Chambers, representing the Town Council of Oudtshoorn, called and examined.

4301. **(Sir Rider Haggard.)** You are going to tell us something about tobacco-growing in this district. Are you a grower?—Yes.

4302. On a large scale?—On a very fair scale.

4303. How many acres have you under tobacco?—I got about 30,000 lbs. last year, about 700 lbs. an acre.

4304. In the statement prepared for us * it is stated that there has been practically no export of Boer tobacco to the United Kingdom. Is that because of its peculiar flavour?—Yes, it is a bit strong, but last year we sent some to England. We received our money, but they did not give us any opinion. We can make it mild also.

4305. Is tobacco increasing?—Yes.

4306. Is it all consumed locally?—Yes.

4307. You have not made any serious attempt to put it on the English market?—No, but we hope to do so.

4308. Is there any point you would like to put before us?—Only this. Mr. Martin mentioned about 101 registered voters who were engaged in farming other than ostriches. I would like to say that, as far as tobacco is concerned, we do not grow it ourselves. We grow it on the tenant system, on half shares. That is why we get so many registered voters on a farm.

4309. Is it profitable?—Yes, I suppose it is as good as feathers just now. When the lucerne ground gets too old we put it under tobacco for a few years to clean it.

4310. Is that why you think you have an advantage over ostriches?—I think we are about equal to-day.

4311. Can you say what is a good return per acre on tobacco?—Last year I got about 700 lbs. per acre. The market was about 8*d.* a lb. That is about 20*l.* an acre, gross. That is in the leaf.

4312. I suppose the expenses are large?—Yes, if you turn it into roll it may give you 1½ lbs. instead of 1 lb. There is a certain amount of lye used in the roll, and it has also more moisture in it. There is a certain amount of ash bush used in making the lye. That helps to increase the weight.

4313. What proportion of the 20*l.* an acre would be expenses?—We reckon to twist 1,000 lb. of tobacco at a cost of a little over 3*l.* That is from the leaf to the roll.

4314. How much does it cost to get it to the leaf?—I have not gone so carefully into the matter. Some bywoners will realise about 250*l.* a year on the half-share system with one white man and two boys, whom they have to pay out of this 250*l.*

4315. Do you think there is room to extend it much?—I think if feathers come down more people will go in for tobacco, and the price will fall unless we can export.

4316. What is the price of land for tobacco?—About 400*l.* or 500*l.* a morgen irrigated when you can get it.

4317. Are there any other points?—No.

4318. **(Mr. Lorimer.)** Has this factory to which you refer taken any definite shape yet?—No. We only started manufacturing last May.

4319. Is the factory for the purpose of extracting the nicotine from the tobacco?—Yes, that refers to nicotine for dipping purposes, but ours is for making smoking tobacco.

4320. The nicotine factory is not in work?—No. Not erected yet.

4321. What do you do with the tobacco which is grown here containing 4 per cent. of nicotine, which Dr. Hahn says is not fit for smoking?—Some of it goes to the Kaffir. He chews it. I would not say it was too strong.

4322. Do you export much of it to foreign factories for the extraction of nicotine?—No.

4323. You think you could grow enough tobacco here to keep a factory going for the extraction of nicotine?—Yes.

4324. Are the sheep-dips which you use imported ready for use?—Yes.

4325. You require a factory for that purpose?—Yes, the one which I mentioned is not for that purpose, but for making tobacco.

* *See* p. 190.

4326. According to your statement you produce in this district more than half the tobacco produced in the Cape Colony?—Yes, this land is specially suitable because there is limestone under the soil.

4327. Have you plenty of available land?—Yes.

4328. Do you get any assistance from the Agricultural Department?—Not much. We had an expert but he was not of any assistance.

4329. Do you make any experiments in regard to the varieties of plants?—No. We keep the old plants. We tried a little experiment but it was not successful.

4330. **(Mr. Sinclair.)** Is there a Government expert appointed to give instruction in tobacco-growing?—Yes, there is in the Union, but not about here. He came here about six months ago, but I think it was in order to learn rather than to teach.

4331. Would it be useful to have such a man?—Well, we must improve, because our tobacco contains such a high percentage of nicotine. It would be of assistance to have an expert instructor.

4332. That is the direction in which you think the State could be of assistance?—Yes.

4333. **(Mr. Campbell.)** In the memorandum there is a statement that dip should not contain less than 8 per cent. of nicotine and on another page it says that your tobacco contains over that percentage and should be suitable for sheep dip?—I do not know, but I will say this that our tobacco has more nicotine than any other tobacco in the Union.

4334. One of these figures must be wrong, but you cannot say which?—No.

4335. You say your tobacco contains 4 per cent.?—I know it contains more nicotine than any other in this country.

4336. How does the production of your land compare with that of other countries?—I cannot say.

4337. I have seen it said that in America they can produce 2,000 lbs. or 3,000 lbs. per acre?—We cannot do it.

4338. You do not grow Turkish tobacco?—No.

4339. Is not that the kind on which South Africa is depending?—That is where we require assistance.

4340. South Africa is supposed to be specially suited for growing Turkish tobacco, is it not?—I think so in some parts.

4341. Is there not a small export?—Very small. We ourselves do not export.

4342. Has lucerne to a large extent absorbed the tobacco land and is it going on now?—I would not say at present.

4343. The tobacco business is holding its own at present?—Yes, but it has not increased very much in the last few years.

4344. **(Mr. Garnett.)** You say that dip should contain not less than 8 per cent. of nicotine. Am I right in supposing that statement to mean that whatever other constituent parts there are in sheep-dip it should have at least 8 per cent. nicotine?—I should say so.

4345. And you say that Oudtshoorn tobacco contains more nicotine than any tobacco grown elsewhere in the Union. The analysis shows over 4 per cent. nicotine. That means that in every lb. you have 4 per cent. Therefore, your argument is that with this high percentage your tobacco is very suitable for the purpose of distilling nicotine in order to make sheep-dip which should contain 8 per cent.?—I am not prepared to say, except that our tobacco contains the most nicotine.

4346. Your argument is that your tobacco is very suitable for making sheep-dip because of the large percentage of nicotine?—Yes.

4347. The 8 per cent. in the sheep dip and the 4 per cent. in the tobacco have no necessary relation to one another?—There is no relation between the 4 per cent. and the 8 per cent., but our tobacco containing such a high percentage as 4 per cent. is, therefore, more suitable as a sheep dip, which must contain not less than 8 per cent.

Mr. Karl Schenck, representing the Town Council of Oudtshoorn, and formerly Government Tobacco Expert, called and examined.

4348. **(Sir Rider Haggard.)** You were formerly Tobacco Expert for the Government?—Yes. I am now and have been for the last twenty-five years a tobacco manufacturer.

4349. What points do you wish to bring forward?—In regard to the nicotine question I would like to point out that at the time I was Expert I had some tables and analyses made to find what were the percentages of nicotine in different samples of tobacco grown in the (then) Cape Colony.

4350. **(Mr. Lorimer.)** Is it the finest tobacco which contains the least nicotine?—Yes.

4351. When you extract the nicotine from the tobacco what do you do with the remainder?—It cannot be used any more, not even for manure. You must use chemicals to extract the nicotine and that makes it injurious for other purposes.

4352. I understand the sheep-dips are imported ready for use?—Yes.

4353. Then if tobacco with a high percentage of nicotine cannot be used for smoking it must be exported to make this sheep-dip?—No, it would not pay. The prices are too high for strong tobacco, which is used for the native trade. Most of our nicotine sheep-dip comes from Austria, which uses its own tobacco. It is also imported from America.

4354. All your tobacco is used here?—Yes. Our export is insignificant and most of it goes to German South-West Africa.

4355. We are told that such strong tobacco is dangerous to use, but people do use it and survive?—Yes.

4356. **(Sir Rider Haggard.)** Are there any more points you wish to bring before us?—In regard to the English market I want to point out that the trade ports for tobacco are really in Holland and Bremen and not London. They can buy there Dutch India tobacco and American tobacco at 4*d.* or 4½*d.*: that is in Rotterdam. We have to pay from 5*d.* to 8*d.* a lb. here, so that clearly shows that we never can export when other countries can sell so much cheaper.

4357. It is not everybody who likes the taste of Boer tobacco. If you could modify that peculiar flavour could you not export?—At the time I was Government Expert I tried to show in what way it could be improved in order to export, but then one has to export in the leaf. In the meantime the feather industry was booming, and owing to the fact that tobacco required more care and trouble it was neglected in favour of ostriches—as far as this District is concerned.

4358. Do you see any prospect of this Boer tobacco being made marketable by a modification of its peculiar flavour?—Yes, by proper fermentation. It could be prepared.

4359. Can tobacco be grown equal to American tobacco?—That is difficult to say. One cannot be positive.

4360. Have you ever seen any tobacco produced in the Union which would class with high class Virginian, for instance?—I have seen about three samples which were simply excellent. There were only a few leaves. I think some came from Sundays River, one sample from here, and one from Pondoland.

4361. Does the Government give any assistance in the way of instruction?—There are several experts in the country, mostly in the Transvaal. There is one at Stellenbosch for the Turkish tobacco, Mr. Stella. We received a visit from an expert some time ago. We gave him assistance, but we have not received his report yet and nothing practical has come of it. In regard to the sheep-dip question, the nicotine is extracted from the tobacco. American tobacco and Havana is said to contain about ·6 to 1·89 per cent. One can also make 8 per cent. nicotine sheep-dip out of that. It simply means one would have to use a larger quantity of tobacco. I do not think the Government is doing all it should do in the direction of giving instruction. We have to use artificial manure to produce the particular leaf which is required for export, and there, of course, we would require Government help to tell us what is required. It would not pay under the present system to export because the local price is too high compared with prices ruling in Europe and is caused through a protective duty of 2*s.* 6*d.* on imported tobacco coming into this country.

4362. **(Mr. Lorimer.)** What is the constituent element in the soil which determines the amount of nicotine in the tobacco?—Chlorine and nitrogen.

4363. Wherever you have a large amount of chlorine and nitrogen have you a large amount of nicotine in the tobacco?—Yes.

4364. Can you counteract that by certain manures?—Yes.

Port Elizabeth, Friday, March 13th, 1914.

Mr. Oscar Evans, farmer, and a Member of the Land Board, called and examined.

(*For the evidence of this witness on "Land Settlement and Irrigation," see p.* 24.)

4365. **(Chairman.)** I understand that you are a large farmer?—Yes, and a member of the Cape Land Board. I was wired to a few days ago by the Minister of Agriculture to come down and give evidence in connection with the ostrich-farming question. I am, however, rather at a disadvantage, as I had not had time to prepare myself with many figures.

4366. In regard to ostrich-farming, the Commission have heard at Oudtshoorn a considerable amount of information. About the industry in this district—is it developing?—Yes, we look upon Oudtshoorn, of course, as the hub of the industry in South Africa. It is owing to the amount of lucerne they are able to grow there.

4367. Can the birds be farmed wherever lucerne can be grown?—Yes.

4368. With equal advantage as in the Oudtshoorn District?—No, I would not say that. It depends on the climate, of course. The quality of the feather has to be taken into consideration. The feather is fragile, and heavy rains militate against it. In Natal they grow feathers to a large extent, but they cannot produce the high-class feather which is grown in the Cape, and even in the Cape there is only a certain part which will produce really tip-top stuff.

4369. The quality being due to the absence of heavy rains?—Yes, in this area, and also due to other climatic conditions—good bright sun and a crisp atmosphere.

4370. Do you anticipate a large increase in the production of ostrich feathers from this country?—Yes, I anticipate a considerable advance in production in the future.

4371. Is there any fear that if production largely increases it may affect your prices?—Well, I do not think it is going to affect the prices very much. We have been nervous about this industry ever since its inception forty years ago. Men have said it was very dangerous to invest money in, but many fortunes have been made out of it since then. In 1888, the average price was 1*l.* 6*s.* 9*d.* per lb., and the feathers exported from this country that year were only 259,677 lbs. Last year the weight produced was 1,033,000 lbs., and the price was 2*l.* 16*s.* 4*d.*, showing an enormous advance

in production, and yet the price is very much higher than in 1888. The fluctuation in the price of feathers has not after all been much greater than with any other kind of product—than mohair or wool, as far as we can see. The increased production does not seem to reduce the price at all. I think there is going to be a big advance in production. The one thing we have feared all along is the competition of other countries. But I may say that I have just been to America, and I was very pleased to have had the opportunity of calling on the ostrich farmers there, and seeing the progress of the industry in that country. I may say that they are a long way behind this country in the production of feathers, and I fancy there must be something in the climate which militates against the production of good feathers. They have been farming ostriches for twenty-seven years.

4372. In California?—Yes, and Arizona. Arizona is the State that resembles South Africa more than any other in America, and they have there large tracts of country under lucerne under the Roosevelt dam. I saw thousands of acres of lucerne, and they are on exactly the same tack as we are. They have good men. The system of farming is exactly the same as ours. I could not find fault with the system at all. We look to America for pretty sharp men as regards breeding, and I reckoned that after twenty-seven years they should have been far in advance of their position to-day. Their feathers were far inferior to ours, and I think it must be due to climatic or other inherent conditions which are against the ostrich. I was told, however, that they intend to push the industry for all it is worth. I had the opportunity of meeting the men at the head of the live-stock section of the Agriculture Department there, and they said they intended to push the industry. They are very keen indeed, and we are very anxious still about the American competition.

4373. And the Australian competition?—That is a big factor also. I have not had the opportunity of seeing them there, but I fancy the birds are doing better than in America from all I have heard.

4374. In Australia and America what do they do for breeding purposes?—They are simply breeding from their own stock. That is one reason they give for being so far behind in the quality of their stock. But I do not think it is, because we started with the same stock as America fifty years ago, and we have made headway. It seems that the Americans have been asleep in regard to breeding from selection. I can hardly attribute their failure to that entirely, however, so I am in hopes there is something inherently wrong with the country from an ostrich-farming point of view.

4375. Suppose a smart American breeder wanted to improve his stock, could he get in one way or another good birds from here?—No, we have confined the borders. They mentioned German South-West Africa, but I promptly reminded them that that was closed also. It is the one portion of South Africa that we feared a leakage from, and we have, therefore, so to speak, affiliated with the German Government in that respect. They confine their borders, and they get our very best stock from here.

4376. They also prohibit export?—Yes, with the understanding that we let them have our stock.

4377. Is that export prohibition absolutely effective?—Yes, it has been effective. I cannot say I have ever heard of any ostrich escaping or getting through. We have been very nervous naturally, but the farmers are particularly watchful. We have heard rumours in one or two cases, but on inquiry we found there was no truth in them. We have heard wild talk of eggs being exported, but I do not think there is anything in it, because eggs are prohibited also.

4378. Then speaking as a practical man in the trade, you think the prohibition is absolutely maintained?—Yes, I think it is. So far, it is effectively maintained, that is as far as the good quality Cape bird is concerned. Americans can get birds from Northern Africa, but they are not so good as ours.

4379. Have you an ostrich stud book?—Yes.

4380. So that every bird born is tracked?—We keep track of all high-class birds. I will not say every bird.

4381. **(Mr. Campbell.)** When you referred to the price of ostrich feathers just now, you laid down the position that the price had increased in the last twenty-five or thirty years?—Yes.

4382. As a matter of fact, during the last few years there has been a considerable decline in the returns from ostrich farming, has there not?—I should say that three years ago ostrich-farming paid perhaps better than at any time in the past.

4383. Is it a fact that at any time during any not very long period the return per bird per year has fallen from ten pounds to three or two pounds?—No. There has been a considerable drop this year. Just at present we are in a slump, but we anticipate a rise later on.

4384. What is the return from average birds during the year?—I should say 3*l.* 10*s.* for good average birds. But there are birds that will give you 15*l.* and even 20*l.* each.

4385. And it will pay to farm birds at that price at present?—Yes, that would be more or less birds running on the veld. Of course, any farmer keeping birds on lucerne would keep a better class than the average. But I am taking the general average of birds throughout the country running on the veld. In the Karroo, for instance, you find hundreds of practically useless birds running on these dry tracts, and they bring the average down very much. If you said the average of birds on lucerne, I should say about 6*l.* or 7*l.*

4386. That is 4*l.* or 5*l.* a plucking?—Yes, taking the average.

4387. Is there any other kind of use to which irrigated land could be put, and which would pay as well as ostriches at present prices—dairying, for instance?—I do not know that it would pay quite as well, but I should say very nearly. With the slump that is on at present I should say there are other branches of farming that would pay as well, but when ostriches are at their height I do not think there are many classes of stock that would compare with it.

4388. But at present prices you think that dairying could compete. Do you think anything else could compete?—I should not say cereals such as wheat and rye, but lucerne as stock food would also pay very well.

4389. Is there any quantity of this land that is irrigated suitable for wheat cultivation?—Yes, but I do not think it would pay to grow wheat. It is far better to grow lucerne.

4390. Not even with a shilling a bushel duty?—No; I mean to say there are other crops that you could grow which would pay better than wheat. There are sections of this country where you can grow wheat without irrigation, and where you have to irrigate it is better to grow the better-paying crops like lucerne, or food for your stock such as turnips and rape.

4391. Is the ownership of land in this district fairly well distributed, or held in the hands of large farmers?—It is fairly well distributed, I think.

4392. **(Sir Rider Haggard.)** With all your agricultural advantages in this country I see you are still large importers of agricultural produce from oversea?—Yes.

4393. By a proper system of bringing your resources into use that could be entirely obviated, could it not?—Yes.

4394. Is it not a fact that, instead of being an importer of agricultural produce, South Africa should be a large exporter?—Yes.

4395. And, therefore, the matter is entirely one in your hands. It is not nature that is fighting against you; it is man fighting against the gifts of nature?—Well, we have to fight against nature pretty toughly in this country, but all the difficulties ought to be overcome.

4396. On the other hand there are many advantages in this country which other countries are not blessed with; for instance, your lovely climate, your soil and its fertility?—Yes.

4397. Therefore I repeat the matter is largely in your own hands?—Yes.

4398. In regard to competition in the matter of ostriches, your present competitors are America and Australia, Natal, and to those should be added German South-west Africa?—Yes, and British East Africa; also Egypt.

4399. I think that is the lot?—Yes. I think so.

4400. You told us about the disabilities of California and Arizona, but you have not satisfied yourself, I gather, about Australia?—No.

4401. I have seen ostriches in Australia, and they are apparently doing extremely well. Do you not think it is possible, if they are behind at present in their output, that it is merely owing to the lack of good stock and new ostrich blood?—Yes, that may be.

4402. I believe I am right in saying that these farms in Australia are now established at great distances from each other. Therefore, will not the ostrich stock in time become sufficiently differentiated—there being these long distances between the ostrich areas—to overcome this difficulty of the lack of new blood to which you refer?—I do not think so. I do nor think it is the lack of new blood as far as inbreeding goes that has militated against their success. We inbreed very much ourselves.

4403. Then there would probably be no reason why Australia should not in time become a great ostrich country?—No, they could breed from what they have, the same as we did.

4404. In Natal, I understand, the red soil stains the feathers?—No, it is black soil in Natal. We have red soil; it does stain the feathers if there is excessive rain.

4405. How about German South-West Africa; is that bad for ostriches?—I think it is very suitable. It is a dry climate, and on the Orange River I think ostriches should do excellently. They have wild birds there now, of course.

4406. Taking all these facts into consideration, are you not perhaps a little too optimistic about the future of the ostrich business, because there are enormous tracts in other parts of the world where ostriches could be reared and will in time be reared?—I can only take the figures in regard to past production in this country and the prices to-day. In 1870 there was only 28,795 lbs. of feathers produced.

4407. But there has been this slump you have mentioned of 50 per cent. in the price of feathers?—Yes.

4408. Do you think that the rumour, in highly civilised countries like England and America, that there is cruelty involved in the plucking of ostriches has anything to do with it?—I do not think so. I was in England just lately and I attended two meetings there. Sir Harry Johnston was chairman of one and the late Sir Walter Hely-Hutchinson of the other. We had good attendances, and I had slides showing the process of plucking and so on. It did not seem to me from what I saw that this rumour had militated much against the industry. There is, no doubt, a little in it, but I do not think it is a serious factor.

4409. You are aware, no doubt, that a good many people do take the view that there is cruelty, especially among ladies of a kindly nature who are rather indefinite as to their facts?—Well, I might just mention that at one of these meetings, immediately after it was over, two ladies came up to me and said they were very pleased to have heard there was no cruelty. They remarked that they had not bought any feathers for three years, but would buy some the next day. We are trying to dispel that notion as far as we can. We are quite alive to it, of course, and we are doing all that we can to combat it where it exists. There is an Ostrich Farmers' Association in this country, and we are working as hard as we can through the Trades Commissioner in London.

4410. I may add my belief that it has militated against the wearing of feathers among the class that buys as a rule?—I do not deny it, but I do not think it is a very serious matter. My belief is that it is dying out more than increasing.

4411. Then to what do you attribute the slump?—To the vagaries of fashion a great deal. Fashions do not always run the same. I would like to see Eastern countries taking up the feather more, Japan and China. I believe they never use feathers.

4412. Are you trying to exploit that market?—We are not doing anything actively at present, but we are considering it. We have asked the Trades Commissioner to suggest any means.

4413. There are no feathers used there now?—They are practically unused. Feathers have been sent over, however. An ostrich farmer a little while ago went over there and presented some feathers to some notabilities there. They were pleased, and the feathers were keenly taken up. We thought of sending over a present to some of the officials.

4414. Perhaps some commercial travellers in feathers might be of assistance?—Yes.

4415. **(Mr. Sinclair.)** In the available markets for your feathers there must always be a rise or fall in price dependent on fashion, must there not?—Yes.

4416. You spoke of the climate of South Africa, and this country being the home of the ostrich, as a reason why you should have the best feathers, but the policy of forbidding the export of either birds or eggs seems rather to weaken that argument, does it not?—There is nothing like being on the safe side.

4417. You are not taking any risks?—No.

4418. Australia's climate and conditions may be suitable, but you are not letting them have birds or eggs?—That is so.

4419. But still you import their rams and other stock, I understand?—Yes.

4420. Is that not rather one-sided?—There are other countries we can import from besides Australia. Why should we give away our only industry? I think we should look after ourselves; to do otherwise would be foolish. I know Australia has brought up that argument before, but I do not think they would let us have their stock unless it paid them to do so.

4421. Ostrich-farming in the past has rather put in the shade other branches of farming, has it not?—Yes. I think so.

4422. And it is being now realised, perhaps helped somewhat by the fall in the price of feathers, that general farming is a valuable asset which has not been exploited in the past?—Yes, but I would say this, had it not been for ostriches we would not have had many benefits that we possess to-day. Take fencing, for instance, we would never have been fenced to the extent we are without the ostrich. It was an undomesticated animal, and when we domesticated it we got thousands of miles of fence erected. Then the lucerne was found so paying that it has been gone in for largely, and now even if the ostrich dropped out we feel that we could step off on to something else. It has brought incalculable good to the country. It has developed industry and been of great benefit.

4423. **(Sir Jan Langerman.)** It has been put to us in this way, that if the ostrich produced 1*l.* per year it would be still more profitable than wheat-growing?—1*l.* per bird per annum?

4424. It would be still more profitable than wheat-growing?—No. I would not like to say that.

4425. You do not agree with that opinion?—No.

4426. Now, as regards the competition of Australia; of course, it is understood that they may improve their birds also, but is our industry in such a condition that it cannot be improved?—I do not say that.

4427. So that we also shall progress?—Yes, we have the lead.

4428. For many years we shall have the lead?—Yes.

4429. We are not stopping?—No, we are advancing also.

4430. You have that comfort, at all events, whatever improvement they may make we are also improving, we do not stand still?—Yes.

4431. **(Sir Alfred Bateman.)** I see that last year there was an increase of 10 per cent. in the average value of ostrich feathers exported from Port Elizabeth?—Yes, last year was a very good year.

4432. So it is only this last two or three months that the price has been low?—Yes, for three or four months.

4433. It began at the end of last year?—Yes, about the end of last year.

4434. Can you contemplate a time in which, although the fashion was rather against wearing ostrich feathers, at the same time the material conditions of the working class in Europe would enable them to use many more feathers than they do to-day—I mean feathers of the more common type, or must you have a certain proportion of superior feathers?—Yes, I cannot entirely agree with the idea of the working classes being able to purchase more feathers on account of increased wages.

4435. Would not that help you?—No.

4436. I gather you are very much in favour of the present prohibition of the export of ostriches and eggs?—Yes.

4437. You think that is quite fair?—Yes.

4438. You have a monopoly and you think you have the right to keep it?—Yes.

4439. Perhaps you are aware that we did the same thing in England in regard to machinery one hundred years ago?—Yes, but do you think you can compare the two?

4440. In England we thought that foreign countries had not got machinery and we would take good care they did not get it. Now you have the best ostriches and you will take care that Australia and other countries cannot get them?—If we let Australia enter the market for ostrich feathers we would both sink together, and what is the good of that.

4441. Then you think that there is only a limited market?—We have been told by gentlemen who have been there that there are great capabilities for ostrich-farming in other countries. We do not take it for granted that it would swamp the industry but we believe in being on the safe side. This industry is our own, and I think it is perfectly fair; the first essential is to look after ourselves, that is my opinion.

4442. Bearing in mind what I said about machinery, do you not think that in time you will come up against a brick wall?—In regard to your machinery it was different. You thought you could keep your machinery in your own country, but we do not want to keep the feathers, we are willing to sell them.

4443. In England the export of machinery was prohibited, that is true?—But in the end you exported and you found it was to your benefit. But it is hardly the same thing in our case. Here we have an industry of which we are masters. It is a real South African industry, and at the same time we can supply the rest of the world with all the feathers required at a fairly good price. Why should we let that trade go out of our hands? If everybody can do the same as we are doing the industry will be drowned at once.

4444. Could you not make up for any possible disadvantage in that direction by charging very high prices for pedigree stock, as we do in England?—We do not want to charge high prices, we are quite satisfied with reasonable prices.

4445. Do you not see the analogy in the export of pedigree stock from England to the Argentine? You may be aware that we send every year a large amount of stock to that country which brings very high prices?—It is competition which makes you do that. But you would not have the same conditions exactly in regard to ostriches.

4446. **(Chairman.)** You said that you adopted in-breeding. Do you deliberately adopt it as a means of improving the quality of your product?—Yes. If you want to fix your type you must inbreed.

4447. Close inbreeding?—Yes.

4448. How close?—We breeders do not, as a rule, like to say what we are doing, but we do breed very close occasionally.

4449. **(Mr. Campbell.)** Do you not think, as a matter of fact, that since the policy of prohibiting the export of the ostrich has been followed in this country, greater attention has been given to the subject in Australia and greater activity displayed in the direction of developing the business than was the case before you adopted the policy of prohibition?—We have always been very keen on the industry. I mean to say, the ostrich farmer in South Africa is amongst the most intelligent section of the farming community, and he has been very hard-working striving to improve his stock all the time, and I do not think that the prohibition of export has given any stimulus in this direction.

4450. No, that is not what I mean. Do you not think that the fact of your prohibiting the export of birds has drawn attention to the value of ostriches in Australia, and that during the last two or three years the activity of people over there has been much greater in consequence?—I cannot say, I have never heard that mentioned.

4451. **(Chairman.)** Have you got the world's figures of feather production?—No, only South Africa.

4452. We should be glad if you could give us a statement regarding South African feathers?—Yes. (*Statement put in as follows:—*)

Ostrich Feathers.

—	—	Value.	Average.		
	Lbs.	£	£	s.	d.
1870 -	29,825	91,229	3	1	2½
1875 -	49,569	304,933	6	3	0¼ highest.
1880 -	163,065	883,632	5	8	4½
1885 -	251,084	585,278	2	6	7¼
1888 -	259,967	347,792	1	6	9 lowest.
1890 -	212,276	563,948	2	13	1½
1895 -	353,651	527,782	1	9	10
1900 -	412,830	876,801	2	2	5½
1905 -	471,024	1,081,187	2	5	10¾
1910 -	741,148	2,272,846	3	1	3¾
1913 -	1,023,307	2,885,748	2	16	4¾

4453. **(Sir Rider Haggard.)** Did the Australian ostriches originally come from South Africa?—I believe so.

4454. Then they were exported before you had these regulations?—Yes.

4455. So you have rather shut the door after the horse has been stolen?—Yes, but you can get that class of stock from North Africa. We only confine ourselves to the high-class ostriches that we keep for breeding.

4456. They can also get them from America?—Yes, but I do not think they would get them, from what I saw. The ostriches in America are not worth anything from a feather point of view, so far as I could see.

4457. But the fact is that the ostriches are there in Australia and you have to face that competition?—Yes.

4458. And you have told us also, I think, that in-breeding does not really matter, and there is no reason why they should not produce as good a bird as you?—Quite so, I have never seen finer ostriches than those in America, they are the picture of health, but they do not produce the feathers we do.

4459. In Australia they have the cousin of the ostrich, that is the emu, and before that they had that other big bird, the moa, which is of the same race, so it would seem that the country is suitable for that class of bird?—Yes.

Mr. Fred H. Holland, member of the Ostrich Farmers' Association of Middelburg, called and examined

(*For the evidence of this witness on "Land Settlement and Irrigation,"* see *p.* 25.)

4460. **(Chairman.)** I believe you have some evidence to give us on the subject of ostriches?—I received a telegram from the Minister of Agriculture asking me to give evidence on behalf of the industry, and also a request from the Ostrich Farmers' Association of Middelburg, of which I am a member. I am an amateur farmer, my chief calling being that of a merchant in this town. One branch of our business is dealing in

feathers, and we are perhaps the principal sellers on the market here. We handle large consignments and we follow the movements of the market very closely. We have had some correspondence recently on the reasons which have operated against the sale of feathers in the markets of Europe and elsewhere, and we are told that the vagaries of fashion are the sole reasons for the slump, the fashion at the present time being for small hats trimmed with ribbons and other trimmings. I heard the question asked as to whether the fact of feathers being cheaper would result in the poorer classes wearing them more largely. Now experience generally proves that such is not the case, and that these people follow the fashions as much as the aristocracy. They wear what the aristocracy wear, and the desire to be in the fashion operates just as much in their case as with the rest of society. As far as cruelty is concerned, I agree entirely with the remarks of Mr. Evans.* I have here a copy of the Bill for the prevention of the importation of plumage which has just been read a second time in the House of Commons. A similar Bill is going through the American Legislature, and there is also one going through the French Parliament. It will be seen that ostriches are exempted, it being generally recognised that there is no cruelty. I have here a return† showing the feathers shipped from this country from 1865 to the end of December last. It is not necessary to comment on that statement in detail, but I would point out that during the past seven years, when over-production has been constantly talked of, we have had a wonderfully steady market. It will be seen that at no time during that period has the price fluctuated to the extent that it has to-day. The average price in 1912 was 2*l.* 12*s.* 6*d.* per lb. That was the lowest during the past seven years, and the highest was during 1910, when it reached 3*l.* 1*s.* 4*d.* Last year, although the production was nearly 100 per cent. greater in weight than seven years ago, you will notice that the average price was still 2*l.* 17*s.* 9*d.* per lb.

4461. What is the price to-day compared to that?—It is roughly from 30 to 40 per cent. less. We reckon that the market has dropped in the last twelve months from 30 to 40 per cent. I wish to say that I agree with Mr. Evans as to the average price of pluckings from veldt‡ birds and lucerne-fed birds. You asked Mr. Evans the average price per plucking and he told you it was roughly 3*l.* per bird for veldt birds and 6*l.* or 7*l.* for lucerne-fed birds. Well, that is about correct, and to-day they would yield roughly 30 per cent. less. There is one point which I think has been missed by the previous speakers on the question of the profits of ostrich-farming. They were asked whether ostriches could be profitably replaced by other stock. It must never be lost sight of in connection with ostrich profits that there is an extraordinary increase of stock. Now if you have a valuable stallion and a valuable mare you can only get one foal per annum, but from a good pair of ostriches you can get anything from 30 to 60 chicks, or putting it at a low estimate you may say from 20 to 40 chicks per annum. And within two years those birds may be worth individually almost as much as their parents, so it is easy to understand what large profits can be made in ostrich-farming quite apart from the production of feathers. Further, there is one great difference from a market point of view between the position when the previous crises took place and to-day, and that is that the industry is now on a much more stable basis than it was thirty or forty years ago. There are now such vast vested interests at stake both in this country and in Europe that more control is exercised than was possible in the past. And I should say that people on the other side will in time make it their business to see that feathers are once more reinstated in public favour by getting into touch with the people who set the fashions. I mean houses such as those of Paquin and Worth, of Paris, who control these things to a large extent. If they make it their business to see that ostrich feathers are written up in every ladies' journal in the world, and that feather hats are displayed freely, it will create a fashion in that direction. I may mention that the ostrich farmers of South Africa are at the present time arranging for a large exhibit at the Panama Exhibition at San Francisco, when it is proposed that exhibits both of raw feathers and manufactured goods shall be shown, besides all sorts of possible costumes suitably designed and trimmed by people of the standing I have just mentioned, and that qualified men shall be sent from this side to speak about the industry, and possibly at the close of the Exhibition that the whole exhibit will be shown in all the principal cities throughout the United States and Canada, and if their efforts meet with success it is just possible that the goods may be shown in the principal cities of Europe as well. For instance, at the present time, Russia takes very few feathers, but there is no reason why a considerable market should not be opened there. Now a good deal has been said as to the competition that we may meet with from other countries. But I would just like to point out one fact, that the exports from Northern Africa in the year 1875, which is nearly forty years ago, were 373,000*l.*, and their exports last year were only 30,000*l.* As far as the world's competition is concerned, from a market point of view we have never regarded it seriously, and we do not yet. For instance, we sell most of the British East African feathers in this market, and their output at the present time is only valued at about 2,000*l.* per annum. The whole of Australia at the present time contains only about 5,000 birds, and farmers who have been over there sheep buying, who happened to be ostrich farmers as well, have told me that the class of birds which they have over there produces a very poor feather, valued at only 2*l.* or 3*l.* per plucking. Now if such is the case, they are only producing less than one per cent. of what we produce, so they are not a serious factor. We are told that outside of Africa, the greatest number of ostriches in existence is in the Argentine Republic, where they are said to have almost as many as we have, including 30,000 South African birds.

4462. How many have you here?—Roughly three-quarters of a million. There are no reliable statistics, but that is supposed to be about the figure.

4463. **(Sir Alfred Bateman.)** They can be counted?—Yes. The magistracies, through the district police, could get information on that point. But in the Argentine the feathers are said to be worth only about 6*s.* per bird per annum, and there must be something in that, because the feathers are never exported from there to the London market, and in America all the best feathers that are used come from this country. America takes from this country directly and indirectly about 60 per cent. of our total output. Most of that

‡ *Witness's Note :*—Veldt birds signify birds that graze on natural, in contrast to artificial, pasturage.

quantity is shipped direct, but they are also very large bidders on the London market, and it is largely due to the fact that the Americans have dropped out of this market lately that our market has collapsed. The question was asked by one of the members of this Commission as to whether the red soil affected the feathers very materially. In such portions of this country as the soil is detrimental to ostrich feathers we use covers. Those covers are put on the bird towards the finish of the feather's growth and kept on, so that during the last couple of months the feather remains clean, just when it would have been long enough to trail on the ground when the birds are sitting down. I have promised to give to the members of this Commission a copy of the stud book pamphlet containing the ostrich section regulations, and I will see that this is sent along.* Special points are given for ostriches just the same as for cattle and horses. Marks are given for length, width, density, shapeliness, lustre, and strength of flue. Now, it has been our ambition for years past to produce in one feather all these qualities. There are many breeders who excel in one or other of these qualities, either in length or lustre or in other ways, but the perfect feather has not yet been produced, the feather that we are all aiming at. There are one or two other matters which I suppose would not interest you specially, such as the diseases from which the birds suffer, bars in feathers, the effects of caponizing, and so on. But in regard to the fancy prices which have been realised on this market, you may be told, for instance, that in 1912 primes fetched 115*l.* per lb., and in April 1913 primes fetched 125*l.* per lb., but I would point out that these were for a few ounces only of specially selected show bunches, and were not bought for ordinary trade purposes. Referring again to the Bill for the prohibition of the importation of plumage in England, I have received a letter from our agents, who are one of the principal firms engaged in the feather trade in London, Samuel Figgis & Co., who write as follows: "A lot of rubbish has been written in "the newspapers about this Bill, but the main factors "that will affect the ostrich feather market will be "fashion, and supply and demand; there is an ever "increasing supply, and during the past five years a "marvellous trade has been done in feathers, but it is "doubtful now if the demand can keep pace with the "supply. It can be overdone, and I am looking for that "time in the not far distant future, but as far as the "anti-plumage Bill affects the demand for feathers, "there is little or nothing in it."

4464. Is that referring to ostrich feathers?—Yes.

4465. Not to other feathers under the Bill?—No. A good deal has been said as to whether this coast belt could be used for other stock to advantage. The answer is, Yes, since dipping came into use, for whereas previous to that, we only reared about 60 per cent. of our calves per annum, we are now able to rear every one, and likewise with horse sickness. That is very rife on the coast at present, but it can be prevented by systematic dipping. My own experience may be of interest to you. I have 30 mules and horses which I used not to dip. Three months ago, when the horse sickness started, I lost two mules in a week, and then I started putting the mules and horses through the cattle dip and then stabling them closely. Since then I have not lost one. A near neighbour of mine during the same period has lost 19 out of 40.

4466. **(Mr. Sinclair.)** Did he not dip?—No. He has started doing it now. Dairying has also been referred to at length. I do not know whether it is generally known to you that since free freight was allowed on pure bred cattle this country has been almost the largest importer of pure bred cattle from the United Kingdom. I noticed that in the English Live Stock Journal it was stated that we are beginning to rival the Argentine in our imports. That country has led by a very long way in the past. Another point has been mentioned in regard to the cost of clearing land for irrigation. I have a farm which is 4 miles south of Uitenhage, which Mr. Mackay referred to,* and this farm was closely covered by bush when I went there. I have kept a record of the cost of clearing that bush and establishing lucerne. It has worked out roughly at 11*l.* per acre or 22*l.* per morgen. Those are the actual figures, and they are to be relied on, because I have compared my figures with those of other farmers.

4467. **(Mr. Campbell.)** Is that the cost of clearing the land only, or the cost of the land plus cost of irrigation plus clearing?—No, the land cost 15*l.* per morgen before doing anything. As cleared it has cost 37*l.* a morgen.

4468. **(Chairman.)** What was it worth?—If the ostrich industry keeps up, it will be worth anything up to 200*l.* per morgen. My revenue from 40 morgen of lucerne last year was 3,700*l.* gross.

4469. What was the net revenue?—It would be considerably less, probably about 1,500*l.* That is with high class ostriches, but ostrich-farming is the most expensive form of farming. I mean the management. The lucerne requires a good deal of labour. We are experimenting just now, at least, a great many farmers in the Eastern Province are, as to the advantage of mowing the lucerne instead of grazing, and feeding the lucerne to the ostriches cut up green, because we find that by grazing systematically the birds damage the lucerne to such an extent that it gets over-run with weeds and couch grass, with the result that the growth of the plants is considerably retarded. You can get a very much greater weight per annum by mowing than by grazing. I do not know whether you are interested in the figures in regard to the sales of feathers through the various markets. The export figures for the years 1912 and 1913 show that the chief volume of business passed through Port Elizabeth and Mossel Bay came next.

4470. **(Sir Rider Haggard.)** I gather that you think the ostrich industry has nothing to fear from the competition of other countries?—I am of that opinion.

4471. And therefore you do still approve of the policy of prohibition of export?—Yes. I confirm Mr. Evans's views entirely, and I may say that it is the view which is held generally by the ostrich farmers of this country on that particular point. I would fear the competition if we sent out of the country our highest-class birds. The increase is so rapid that if we sent out our finest birds to countries such as Australia, where birds are already doing well from many accounts, they would soon be able to produce almost as good feathers as we can, granted that their climatic conditions are similar to our own.

4472. Then you do not think they will be able to evolve a first-class bird themselves?—No, I do not, largely owing to the fact that I believe that most of the birds that have been sent there from this country in the past were culls. There is a vaster difference between the progeny of ostriches than any other live stock known. It is more pronounced than with poultry even. You may have a pair of high-class birds worth 400*l.* and you may get chicks worth 200*l.* apiece, and in the same clutch some chicks which would be rejected as culls, and which would only be worth 2*l.* or 3*l.* apiece.

4473. Does Australia prohibit the export of its fine breeding sheep to you?—No.

4474. I suppose you maintain that the question of friendliness between two great Dominions does not enter into the matter where business is concerned?—No. I feel that if they were of opinion that they were not serving their own ends by sending us their stock, they as shrewd business men would not encourage us to buy their stock at these fancy prices.

4475. But that is only supposition?—Yes.

4476. In regard to the matter of sickness in horses, as an old South African myself it was interesting to me to hear you talk about dipping horses for sickness. I myself in the olden days had losses from horse sickness. Has our theory been dispelled that this sickness was due to turning out the horses when the dew was

* Not reproduced.

* Question 420, page 23.

on the grass?—Yes, it is the mosquito that rises during that time. It has always been thought that if you kept the animals off the grass they would be safe, but that is not the scientific reason. Dr. Theiler investigated the subject for three years and proved that it is a mosquito-borne disease.

4477. Like malaria?—Yes. The result of Dr. Theiler's investigations will be available from the Agricultural Department. By dipping weekly a certain amount of poison is left in the skin and hairs and this is poisonous to the mosquito. Dr. Theiler proved that he could immunise mules and horses by inoculation, but about 25 per cent. died in the process, so it is better to adopt ordinary precautions such as putting them in a fly-proof stable. As our stable was not fly-proof, we dipped them also.

4478. You say you are now feeding the lucerne green to the ostriches instead of grazing them?—Yes.

4479. Is there not this advantage that you lose the manure?—No, the birds are run on bush ground that has been thoroughly cleared, and which in time will be used for ploughing up again.

4480. And you supply the deficiency with basic slag, I suppose?—Yes, but lucerne does not need manuring to the same extent as some crops because it is nitrogenous and gathers a good deal from the air.

4481. **(Mr. Sinclair.)** I gather from you that it is your opinion that the fall in the price of ostrich feathers is merely temporary and that the industry will recover in the ordinary course?—Yes, I think so when there is a change in fashion.

4482. That would mean, I take it, that ostrich-farming would continue to be a leading industry?—It is not our leading industry. The wool industry exceeds it. But it is our most profitable one per acre.

4483. Can you offer any opinion as to what would be the effect of that upon ordinary farming operations?—It will tend very largely to these areas being taken up by private individuals for ostrich-farming. People who have made money out of ostriches in the Midland District and Oudtshoorn have gone further afield and acquired river frontages, and they will go on doing so as long as the ostrich industry warrants it. Already on the banks of the river near Kakamas the ostrich industry has been established, and it will be further developed if the business warrants it.

4484. Is it the case that the irrigable land you have spoken of cannot be so profitably used for any purpose as that of ostrich-farming?—That is the general experience of ostrich farmers as a class, and they are a fairly shrewd lot. With regard to wheat-growing, the Government of this country sent two expertfarmers to Australia about twenty years ago, Messrs. Halse and Visser, and their report can be obtained from Cape Town. They came back and reported that we could never compete successfully with Australia in wheat-growing because our climatic conditions were against it, that wheat could not be grown under irrigation cheaply enough to compete with Australia, where they had a suitable rainfall. For wheat-growing the rain must come at a certain time, and with us it comes at the wrong time and intermittently.

4485. Does it follow from that that, in your opinion, the most profitable use to which this land could be put would be ostrich-farming, leaving the Union to continue as now to import largely its own food supplies?—Yes, that is my own experience. I was of opinion that I could develop a cattle and dairy industry with advantage, and I imported a dozen shorthorns of high grade milking stock, but my returns from these are a mere bagatelle compared to a similar value invested in ostriches. I may also add that among farmers, generally speaking, in the Karroo there is a standing joke that cattle are 6 per cents., sheep 10 per cents., and ostriches are 100 per cents.

4486. You told us that ostrich-farming was rather expensive?—Yes.

4487. Is a large amount of labour involved?—Well, we have to take far more trouble with the lucerne lands than with the others. We have to irrigate it twice between each cutting, and we cut it repeatedly—about six to seven times each season. Then in regard to ostriches; from the earliest age, even before the chick is hatched until it is fully grown, it requires a great deal of attention. If you incubate you have to be their foster mother, and if you pamper them too much they damp off. You have to watch them very carefully for the various diseases, such as wire worm and tape worm, and to be constantly dosing them, and you have to find clean areas for them, because if they run on foul areas they are more liable to disease; in fact, Oudtshoorn is not so good for them for that very reason. When they grow bigger, we have to watch their feather growth from day to day, and also their feeding, and have to have intelligent people to look after them. With regard to these covers for the feathers, every bird has to be caught twice a fortnight and the covers taken off, and two days afterwards they have to be caught again for these covers to be replaced. It is not a very simple matter to catch them, so that it all makes for great cost.

4488. Then it is not correct to say that ostrich-farming is a system of farming that does not employ much labour?—No. I may also mention that when I acquired this farm, one of my ambitions was to prove to myself that farming on a small area could be made to pay. My holding is only 340 acres, and when I went there, there was not enough food for two horses and two or three cows, but to-day we are running 500 ostriches, 30 mules and horses, and 40 head of cattle, and I am employing four white men and 15 coloured men, and I have only really developed one-third of that area.

4489. Can you compare the amount of labour involved in ostrich-farming with that required with other classes of farming?—I would point out that with the style of farming that I referred to just now, where you have high grade imported cattle, they require a great deal more attention than the cattle of the country; but I should say that on an intensive culture farm, with ostriches and lucerne, you would require 400 per cent. more labour than for ordinary cattle farming.

4490. Is that labour white or coloured?—It is both. There is about one white to five blacks.

4491. You told us the number of chicks that would probably be produced in a year by a pair of ostriches. What proportion of that number is reared on the average? I understand there is considerable infantile mortality?—It varies considerably. When I started I only reared from 30 to 40 per cent., but to-day I am rearing about 95 per cent.

4492. We were told the other day that only about one-third are reared?—When I started, for every 300 I raised I reared about 100, but to-day we are only hatching 100, and rearing them practically all, in preference to overstraining the capacity of ostrich hens for laying unlimited numbers of eggs.

4493. **(Sir Alfred Bateman.)** I gather that the ostrich-farming business is very lucrative, but at the same time, in view of fashion, it is rather hazardous?—Yes.

4494. The only crop we have in England to compare with it is the hop crop. It has been found that if a man has 200 acres it is better for him to put only about 30 acres under hops, and from that he may get 40*l.* an acre, or he may get nothing. Would it be possible for the ostrich industry to be more sub-divided in that way, and that where a man has 500 morgen he could put a certain amount of land under ostriches, so as to give him a sporting interest in feathers, and devote the rest of his farm to general agriculture?—Many are doing that. A number of ostrich farmers have gone in for pure bred merinos lately, and I think you will find that a slump, such as we have at present, will have a most beneficial effect on general farming in this country, and that many farmers will turn their attention to other branches of farming, out of which they may not get such high returns, but which will be far more reliable.

4495. **(Chairman.)** If the produce of a pair of ostriches is from 20 to 60 in the course of a year, why does not the number of birds in the country increase even more rapidly than is the case at present?—I think it is largely because the common birds are allowed to die out. I mentioned just now that there

was a large percentage of culls in the progeny of the finest ostriches, and at a time like this, when a man may only be getting a moderate yield, he will turn them off the lucerne lands into the veldt to do the best they can. He does not artificially feed these, and if the inferior birds manage to survive the drought, all well and good, but if not, it is no great loss. But the best birds will be carefully looked after.

4496. Compared with twenty years ago, is the quality of feather now produced better?—Yes, there is a constant improvement and greater strides are being made every year. No doubt twenty years ago there were just as perfect feathers in the individual respect as there are to-day, but in combination of various qualities we are much nearer to the ideal feather to-day than they were twenty years ago.

East London, Monday, 16th March 1914.

Mr. Carl Heinrick Bock, Jr., Wool-buyer, called and examined.

(*For the evidence of this witness on "Freights," see p. 75.*)

4497. **(Chairman.)** I think you have a knowledge of the wool trade?—Yes. I have prepared a statement.

4498. Will you please read it?—No doubt you are aware that East London has for a long time been, and is still, the chief wool-exporting centre of South Africa. I have drawn up some statistics which will prove to you the importance East London holds as a harbour in respect to the shipping of wool.

During the last ten years the exports in bales were as follows:—

1904 -	85,647	1909 -	139,561
1905 -	85,487	1910 -	139,977
1906 -	91,486	1911 -	146,141
1907 -	101,630	1912 -	165,722
1908 -	113,687	1913 -	181,139

This shows a constant increase, and you will also see that within a period of ten years the shipments of wool in bales have more than doubled. The districts coming chiefly into consideration for East London are Kaffraria, Transkei and Basutoland, Barkly and Dordrecht, and the Southern Free State. Of late we are also receiving a good few clips from Winburg and other districts north of Bloemfontein. The quality of South African wool is a very good one, and almost exclusively of the merino type. I have seen wools from the Kaffrarian and other flocks which in their washed state at home are in every respect equal to those from Australia. The importation of good Australian stud rams and sheep such as Wanganellas, has a very beneficial effect on the flocks. The majority of farmers begin to realise that if care is used in making up their clips in a good marketable manner very satisfactory prices are obtained. Some districts, however, are still working in the same old fashion, namely, in breeding heavy, undesirable wools of Vermont type, and it seems very difficult to bring home to those growers that heavy weight of fleeces is not at all to their advantage, inasmuch as the value of their wool is concerned. We are getting clips here which contain 75 per cent. of waste, and it is but obvious that buyers are very reluctant in making offers for wools in such a dangerous condition. Some successful trials have of late been made in sheep farming along the coast. Whilst thirty and more years ago East London was receiving a good quantity of wool from the near coast districts, sheep-farming had to be abolished on account of heart-water caused by ticks, which disease killed nearly all the flocks. Messrs. Cooper Nephews—the dip firm—have of late been experimenting again with sheep on their farm about 10 miles from here, and whilst at first the mortality among the sheep was largely due to the ticks, they seem to have overcome the disease by now, and in exhibiting their wool, which was clean and of good quality, obtained the satisfactory price of 8*d.* per lb. It is to be hoped that the good results may continue, and that we can look forward to a substantial increase of wool from the coast again. During the last decade, users of South African wool in Europe have found it more to their advantage in establishing their own buying offices in South Africa, whilst up to then the grower was to a great extent dependent upon the prices obtained at the regular wool sales in London. It is but natural that these representatives are nearly always in a position to offer a higher price respectively than would be obtainable in London, where heavy dock and extra heavy warehousing charges are in evidence. That these buyers are able to easily absorb the whole of the South African clip is clearly shown by the present state of affairs, where nearly at the close of the season, with the exception of the offerings at to-day's public auction, barely 500 bales are carried in stock, whilst similar conditions prevail at the other coast ports. The outlook for sheep-farming in general must be considered as a very promising one for South Africa, and with Australia, according to the "Wool Record," being now nearly fully stocked with sheep, and South America decreasing its export of wool, on account of the vast lands being more and more turned into cattle camps and used for agricultural purposes, it may rightly be hoped that South Africa in years to come may be in the first rank among chief wool-producing countries of the world.

4499. **(Sir Rider Haggard.)** You say there is every reason to hope that South Africa may become one of the chief wool-producing countries in the world. I suppose you are bearing in mind the enormous output from Australia?—Yes.

4500. And you think that South Africa has a prospect of competing with Australia?—Yes.

4501. What is the difference in the output at present?—We export from South Africa at present about 400,000 bales.

4502. And Australia? — I should say about 2½ million. But you must bear in mind that South African bales are heavier. In pounds they are much nearer the Australian mark than in bales.

4503. You really consider that the wool prospects of this country are hopeful, and that it may, in a measurable time, compete with Australia in regard to its output of wool?—Yes.

4504. How will you do that with your present population?—The population has to be increased.

4505. So, when you say that, you mean provided there is an adequate population to produce the wool?—Yes.

4506. So it comes down to a matter of population?—Yes, on the whole. But in years to come we shall compete successfully with Australia. I mean to say, we have the lands, we have the soil, and we have the climate which can produce good sheep and good wool.

4507. All you want are the men and the sheep?—Yes.

4508. **(Mr. Campbell.)** On what ground do you base your statement that Australia has now reached its maximum production of wool?—That is according to a report in a Bradford wool paper.

4509. And there is no more possibility of an extension of the sheep-raising industry?—No. They say that Australia is now nearly fully stocked with sheep for wool-breeding purposes, and that they are using all the land available.

4510. You spoke about improving the quality of the wool clip and its value in regard to the wool industry. What has been the cause of the better attention paid by the small farmers to the get up of their

clips?—The establishment of auctions at the coast has had a lot to do with it I should say. Up to 1908 all wools were sold privately, but since then auctions have been started and they have proved a big success.

4511. Is there any means in this district of giving the farmers instruction as to the get-up of the clip?—They have Government experts here.

4512. Do they travel round?—Yes.

4513. Do they give practical demonstrations?—Yes.

4514. And is that an effective means of instruction?—Yes.

4515. And, generally speaking, would you say that the majority of the farmers fall in with the idea of getting up their clips better?—I would not say the majority. The progressive farmers naturally do so, but we have a lot of backveld farmers in this district and further along who will not hear about getting up their wool in a marketable manner. They go on in the same style. Their idea is to breed heavy wool. They seem to think that all they want is heavy fleeces.

4516. And I suppose that in addition to depreciating the value of their own wool they damage the reputation of South African wool generally?—Yes.

4517. So one of the great reforms that is needed in South Africa is better education of the farmer in the production of his wool and in getting it up for market?—Yes.

4518. In regard to the wholesale houses you speak of who have established agencies here for wool buying, what class of house is it that does that?—The Woollen Mills.

4519. Is the system of central auctions for selling the wool the same as in Australia, where great wool sales are held in each capital city once a year?—No, we have only these at the coast.

4520. Do you not think that the establishment of these auction sales at other centres also would be of benefit to the industry and to the country as a whole?—No, I do not think so. As the wool has to come down to the coast to be shipped in any case, I think they would find it much better to have the sales here, where there is more competition and where all the buyers are. We in East London have more buyers of South African wool than there are buyers in London for South African wool.

4521. What class of wool is it that you produce, fine or coarse wool?—It is almost exclusively of the merino type.

4522. Cross breds?—No, only a few bales.

4523. It is the Australian merino strain?—Yes.

4524. And you get the stud stock from Australia?—Yes.

4525. Is it the general experience that the strain of sheep which comes from Australia keep up the quality of their wool in South Africa?—Yes.

4526. Would you say they simply held their own or that the wool improves?—I should say they hold their own.

4527. There is no improvement?—No.

4528. I suppose that stud breeding is not known here?—Not greatly known, but we have the more progressive farmers who are going in for it.

4529. And you think that stud breeding will be an increasing factor here?—Yes.

4530. And that will tend to create a class of sheep better suited possibly for South African conditions than you can get by importing your stud stock?—Yes.

4531. **(Mr. Sinclair.)** Is there any tendency for the wool to go back in quality unless it is reinforced?—I do not think so. We do not import any cross-bred sheep for stud purposes. Only merino types, and I do not see any reason why the wool should go back.

4532. I suppose that in the time of which you can speak there have been material improvements in the quality of the wool produced here?—Yes.

4533. Have you any difficulty here in regard to your shearing?—I do not think so.

4534. Who does it?—The natives. They go from farm to farm.

4535. Can you tell us anything about the sheep themselves apart from the wool? I think you have about 35 million sheep in the Union?—Yes.

4536. You have not sent many of them away in the shape of frozen mutton?—No.

4537. Can you tell us why that is?—I should think it pays the farmer better to grow wool, with the exception of the very cross bred type. But even the wool of those sheep fetches a tremendous price, so it pays better to go in for wool-growing.

4538. Is it a factor that the areas of land here are so large that the sheep are kept back for stocking them?—I have not heard.

4539. Are the facilities for bringing wool to your ports reasonably good?—Yes.

4540. Have you anything to complain of in that direction?—No.

4541. Do foreign buyers, apart from local representatives, come here to compete at your wool sales?—Yes.

4542. American buyers are represented?—No, not yet, but with the abolition of the tax on wool they are bound to come. But we have German and French buyers in large numbers.

4543. Under the old conditions, before the alteration in the tariff, it was in the finer classes of wools that American buyers bought from the Colonies?—Yes.

4544. And you have not supplied any parts of their purchases in the past in regard to that quality of wool?—I have.

4545. They have already bought?—Yes.

4546. Did they buy through agents?—They bought through European houses.

4547. Whose agents were here?—Yes.

4548. **(Mr. Campbell.)** What is the average clip for fine sheep?—It varies. In Kaffraria it is from 5 to 8 lbs. In Dordrecht and Barkly and Aliwal it goes up to 12 lbs.

4549. What is the price of South African wool compared with Australian wool?—It varies. At the East London sales the hoggets of a special clip fetched 13*d*.

4550. While at the Australian sales wool of the same class was selling at what?—I should say about 14*d*. or 15*d*. That is only on account of the lighter condition and higher yield, not so much on account of quality.

Mr. R. H. F. Dumaresq, representing Messrs. William Cooper and Nephews, Dip Manufacturers, called and examined.

4551. **(Chairman.)** Will you tell us about the various dips which Messrs. Cooper have introduced into this country and their effect?—We have only introduced as an entirely new dip the cattle dip. This is an arsenical dip which we perfected two years ago, and nine years ago we bought a farm about 10 miles away from here with a view to proving that what had hitherto been a failure, farming cattle on the coastal belt, might today be made a practical success. I suppose that five or six years ago we could not rear 10 to 20 per cent. of our calves, but to-day we lose hardly one and at the recent show I was able to put on a pen of lambs born on the coast, 20 or 25 merinos, from our small flock in which we now suffer no loss from heart-water, which was a complaint very bad here a few years ago. That is a result which I do not think has been attained here for fifty years. Now, I think, we have made farming on the coast a practicable proposition by eradicating the ticks, and the proof of this is the big jump in land values which has taken place.

4552. You consider that the jump in land values has been due largely to the knowledge that the risk from these diseases is now much less than it was

formerly?—Yes, to the fact that you can eradicate these diseases by dipping and destroying the ticks. Dr. Theiler says that 80 per cent. of the diseases of cattle in this country are tick-borne diseases.

4553. Are you in competition with other firms?—Yes, we have the usual number of competitors.

4554. **(Mr. Bowring.)** Does your dip kill the ticks or merely prevent them from attacking the animal?—It kills them. The idea of a cattle dip is to be non-protective, so that you, as it were, mop up by successive dippings all the ticks in the neighbourhood. We are now dipping every four days. Five hundred head go through every four days. We have East Coast fever in the district now, otherwise we would not dip except once a week or once a fortnight.

4555. **(Sir Rider Haggard.)** What is the cost of this dipping per beast?—From memory I cannot tell you exactly, but according to the interval, I think I am right in saying that for a three or four day interval it will cost you, roughly, 10*d.* a head per annum, and for a fortnightly dipping 4½*d.* per head per annum.

4556. Is it done with a tank or by spraying?—With a tank. They go in very readily. After a time you cannot check them.

4557. Is that because they like it, because it frees them from a torment?—I do not know.

4558. Do you believe that you will by degrees catch all the ticks and kill them?—I consider so.

4559. And that you will eventually mop up the entire tick population of the neighbourhood?—Yes.

4560. After dipping, the animals go out and catch more ticks and they are killed, and so the ticks become scarcer and scarcer?—Yes.

4561. If they catch more ticks when they go out, why do not those ticks give them the disease?—They are not pathogenic. There are so many different kinds of tick. The heart-water tick is the bont tick.

4562. If they catch more ticks, why do not those ticks give them more disease?—Because the tick has not got the disease into its system. The function of the tick is to propagate the disease. The disease is carried from one diseased animal to another by means of the tick.

4563. **(Mr. Campbell.)** It carries the disease from a diseased animal to a healthy animal?—Yes.

4564. **(Sir Rider Haggard.)** I understand that the tick is the host of the disease?—Yes.

4565. If you get your cattle clear, the tick cannot get the disease, and cannot give it to another animal?—Quite so, and you also lose your immunity. Our farm used to be a red-water farm. I will give you an instance. A boy of ours took as pay four young bullocks from the farm, and brought them to East London, near Amalinda, and they all died of red-water. That shows that since we have stamped out every red-water tick, we can no longer say that our animals are immune from red-water.

4566. Therefore you are running that risk, with all your advantages and with all this dipping, that you lose this immunity which cattle have from salting or otherwise?—Yes, in a sense we do, but we hope that in the end the results will be far more satisfactory from the dipping.

4567. Is it a fact that mosquitoes have something to do with these diseases as well as ticks?—They undoubtedly have something to do with blue-tongue and horse-sickness.

4568. And this dipping has the same result?—No. I should say it helps to some extent, but I think that for the mosquito that carries horse-sickness there is nothing certain but stables with mosquito-proof netting.

4569. The net result is, in your experience, that this dipping is bringing about a totally different state of affairs with reference to the breeding of live stock?—Absolutely.

4570. And a country which was before practically impossible in that respect is becoming a very good and useful cattle country and very suitable for the rearing of all animals?—Yes.

Major-General Sir EDWARD YEWD BRABANT, K.C.B., C.M.G., called and examined.

(*For the evidence of this witness on "Land Settlement" and "Cotton,"* see *pp.* 26 *and* 279.)

4571. **(Chairman.)** You have been kind enough to come here and give us evidence in regard to the agricultural development of this district. Will you please tell the Commission the salient points?—I have been here for about forty-four years. After I left the Army I came here and settled down, and there has been a very great change since then. When I settled here first of all you could keep sheep on the coast during the winter. The farmers up-country brought their sheep down here to keep them during the winter, and then the disease known as heart-water broke out and they had to give up sheep farming; but now, since East Coast fever came amongst us, we have discovered that dipping for East Coast fever has got rid of the ticks to a great extent that affected sheep, so that you can now not only keep sheep in winter in this district, but all the year round, which must mean a very great development in the district in the immediate future. With regard to cattle, the same thing applies. For many years we could not keep cattle satisfactorily. We could not rear calves in large numbers. One disease especially, known as liver disease, caused us a great deal of trouble, and the Veterinary Department struggled with it for years trying to find a remedy. Directly we tried dipping for East Coast fever the other disease disappeared, and we find that a great part of our diseases now disappear when you regularly dip. They were all tick-born diseases. In regard to agriculture, the difficulty was this, it was so easy to make a living in this district by keeping 200 head of cattle that nobody would trouble about it as a rule. You have a great difficulty in getting progress made in that respect.

4572. **(Mr. Sinclair.)** You told us that it had been so easy to make a livelihood with a few cattle that the people have not bothered to go in for agriculture. Is it not the case generally, that the conditions have been so favourable under which settlers have been able to make money by ostrich-farming or cattle-farming, that the point of wrestling with the land of South Africa has never been reached?—That is quite so.

4573. And when that problem comes to be seriously tackled, it follows, does it not, that there must be a great development in the products of the Union from its lands?—Undoubtedly. There are immense possibilities. I am not speaking about the up-country districts, because I do not know so much about them, and it is a different class of land altogether. But along the coastal districts there are immense possibilities of development.

4574. Strenuous farming does not seem to have been seriously undertaken?—Very little.

4575. Is the trend now in that direction?—To some extent. I know a farmer who is a most strenuous worker and he has turned what appeared to be almost valueless land into most valuable land and is getting great crops of mealies.

4576. Do you know the land through which we travelled yesterday in approaching East London, the land we passed through during the whole of yesterday forenoon?—Yes.

4577. Can you give the Commission your opinion as to the capacity of that land? It seemed to us to be rich red land; is it land that, given water, will grow crops?—Yes. You do not want irrigation about here. In the Bedford district, I believe, they do irrigate to a certain extent, and it is looked upon as one of the best districts in the Colony. When you reach King Williams Town, you get the red loam which is capable of high cultivation.

4578. And none of that land, broadly speaking, is under cultivation now. It is used for grazing purposes,

no doubt, but very little of it visible from the railway line is under cultivation?—If you are speaking of the Bedford district, there are most valuable sheep farms there; the Bedford district is one of the best in the Colony.

4579. You think that all that land is suitable for agriculture?—Yes, a great deal of it.

4580. **(Mr. Bowring.)** Is that land to which Mr. Sinclair has referred farmed mostly by Kaffirs?—There is a large kaffir location about 10 or 15 miles from King Williams Town, called Debe Nek, but there is also a large number of small German farmers.

4581. These Kaffir kraals are simply where the labourers live, are they?—No, not all. There is a large native location at Debe Nek, but in the Bedford district there are no native locations at all. They are entirely European farms. And at Middle Drift you came to a native location, but most of the country, three-quarters of it I should think, is under European occupation.

4582. The Kaffir huts are where the labourers live?—Yes.

4583. **(Sir Rider Haggard.)** Have you farmed here yourself?—Yes, for thirty years in this neighbourhood—the farm now belonging to Coopers—the Dip people.

4584. In those days you had to contend with all these diseases?—Yes.

4585. And suffered from them?—Yes.

4586. All the cattle are dipped now, are they not?—Yes, everything.

4587. How often?—It depends. Once in seven days in most districts. In an infected area, once in five days, and on farms actually attacked by the disease, once in three days.

4588. Are you talking of cattle or sheep?—Cattle.

4589. Are sheep dipped?—No, not regularly. You cannot dip them very often.

4590. You dip them for scab, do you not?—Yes, but that is only twice a year, as a rule. In the Komgha District farmers have told me that they find, if they dip them once a month, it is as much as they will bear, and sufficient to destroy the ticks.

4591. Then they are dipped once a month?—Where they are in large numbers, but down here it is only recently that we have taken to keeping sheep, and in small lots at present.

4592. But there is a prospect now that even in these coastal districts all stock will be rendered quite healthy?—Yes.

4593. Whereas some of us have reason to know that in the past there was no more hazardous occupation than trying to keep stock in South Africa?—Yes.

4594. Therefore, the whole outlook for agriculture has been changed by the discovery of the strange efficacy of dipping?—Yes.

4595. Because you tell us that all these diseases were tick-borne?—Yes.

4596. Is it not a fact that they are also mosquito-borne—some of them?—Not here, I think.

4597. Horse sickness?—We suffer very little here from that.

4598. Well, the dipping is efficacious against both tick and mosquito?—Against the tick, certainly. I do not know about the mosquito.

4599. Therefore, the whole outlook in your district has been changed by this discovery?—Yes, and in many others.

4600. Which has actually come into use during the last five years or so?—Yes. The East Coast Fever has been a blessing in disguise really.

4601. **(Mr. Campbell.)** You say that dipping is of vast importance to success with stock?—Yes.

4602. Is it made compulsory by regulation?—Yes.

4603. By regulation by the Union Parliament?—Yes.

4604. How is that enforced?—In the first place, you cannot keep cattle at all unless you have a dip on your farm or have access to one.

4605. How does the Government know that the farmer uses it?—The police inspect the farm, and if the farmer has broken the regulations, he is brought before the magistrate.

4606. Is the regulation strictly enforced?—Yes. Part of the district is actually infected at the present time, and that is under the Veterinary Department. They watch very carefully and confine the disease to one locality as far as they can.

4607. Such districts are segregated?—Yes.

4608. In reply to Mr. Bowring, you spoke of a large Kaffir settlement between here and King Williams Town?—Between King Williams Town and Alice.

4609. We noticed these Kaffir huts all along the line side?—That would be the Debe Flats, and Middle Drift, where you crossed the Keiskama.

4610. And Blaney Junction?—No, there is no native location near Blaney Junction, and none near King Williams Town till you get 10 miles out. There are, however, large native locations in the district of East London.

4611. Are those natives employed on white farms?—No, on the locations. They are on their own land.

4612. But they do come to work on white farms?—Yes. The farms have to give their servants land.

Kimberley, Wednesday, 18th March 1914.

Mr. A. R. Radloff, Jr., called and examined.

(*For the evidence of this witness on "Artesian Water,"* see *p.* 32.)

4613. **(Chairman.)** One of the points on which you desire to give evidence is horse-breeding, I think?—Yes. Our great difficulty in regard to horse-breeding at present is that there is a slump in the market for horses. We have been breeding for a good many years, and we want to get into touch with the Imperial Government to see if we can come to some arrangements whereby our breed of horses can be made use of for army purposes.

4614. For India?—For India, and also as remounts.

4615. In England or in India?—Both.

4616. What type of horse are you breeding?—Everybody is breeding a different type of horse. They are mostly breeding the thoroughbred.

4617. For what purposes?—As a utility horse.

4618. That has been a failure, has it?—Not directly. As we know, in the late war the Colonial horse had the stamina, and we can breed the particular horse that is required, if there is a possibility of getting into the market.

4619. What stock are you breeding from at present?—We started, in the early days with a horse called the "Hantam," from the Colesberg District. Its points were hardiness, good hoof, and splendid stamina, and then we always built up the stock by importing different sires. Then we went to thoroughbreds, and after that there was the hackney type and the Cleveland, and so everybody has been breeding the type of horse which he fancied himself. There has been no common object for which all have been breeding. We have been working in the dark, more or less.

4620. Has the Breeders' Association been in communication with the Remount Authorities, either in England or in India?—Not that I can tell you of.

4621. **(Mr. Garnett.)** Can you tell us whether at any time this Province supplied a number of remounts to the Indian Government?—Yes, in the early days. One of my neighbours told me that his father was commissioned to buy remounts for the Indian Army, and in those days they did a great trade with the Indian Government, and now we have lost that trade, and it has gone to Australia.

4622. Can you tell me what their standard was as regards height?—A horse, about 15 hands, or 14·2; in some few odd cases, above that.

4623. I think their standard is above that now?—Yes.

4624. I think the standard is about 15·2 now. If you want to breed a horse up to that standard, it will be difficult for you to get back into that business, will it not?—That is why we have been lately breeding from heavier sires.

4625. Do you prefer to have size in your sire, or in your dam?—We prefer it in the dam, but to get that size we have to employ the heavy sire.

4626. The usual type of native horse, apart from the imported heavy sire, is rather a blood type?—Yes.

4627. And exceedingly hardy?—Yes.

4628. If you can but improve the size, and get them up to 15·2, and weigh half a ton, and measure 8 inches below the knee, you may look forward to good business. But do you see any prospect?—I think we can look forward to obtaining it.

4629. May I put it this way: I should imagine that what the Government will want will probably be a three-quarters or seven-eighths horse with substance?—Yes.

4630. What is your opinion as to getting that by importing hackneys?—We have finished with hackneys. We are against that breed.

4631. Are you laying yourselves out to improve the breed of your horse, so as to enter into competition with Australia for the remount business?—We are open to do so.

4632. You are trying?—Yes.

4633. What steps are you taking?—The breeders have imported a heavier type of horse, and also Clydesdales. But I should say the Oldenburg is gaining more ground than the others.

4634. Is it of the East Prussian type, which approximates to a blood horse, a heavier breed?—It is heavier. It is next to the Clydesdale, I should say.

4635. Are the breeders, generally, in the country satisfied with that particular way of breeding—that is from the heavy sire to the better bred dam, as the better way of getting what you want, or are you in the experimental stage?—We are in the experimental stage. We have not had the proper assistance yet. Every man is following his own head.

4636. And everything has been done on no system?—Yes.

4637. And you are going to get something like a horse without either name or nation?—Yes.

4638. I should say that is a hazardous way of attempting to get back into the Indian market?—Well, with the class we have, we are open to compete against anybody else, as far as that particular standard for endurance goes, especially. We want to know if we cannot have a certain market for the future. What is to become of the horse in the future?

4639. Have you been at it long enough to test the relative stamina of your crossbreeds with your indigenous horses?—Yes, our experience has now extended to about thirty years in the horse-breeding business, and we have got to a standard class of mare 15 hands to 15¾, and we have in the meantime also bred a smaller class of horse. I may mention that naturally our conditions and climate tell greatly on our horses. We do not go in very much for artificial feeding. That is the drawback. Our horses have to follow the natural course, and when you have had several years of drought, the horses deteriorate in size, but the stamina remains. The height and size of these horses certainly diminishes by these successive droughts.

4640. What I wanted to get at was this. As the result of this cross breeding with your imported horses, can they go through as hard a day, and have they the same endurance as, say, your own uncrossed horses or ponies of 14·2 hands?—We find that when we increase the size the endurance is diminished.

4641. At present the nett result of your increase of size is to deteriorate your breed?—Yes, as far as stamina goes.

4642. Have you thought of any other method of importing blood horses, importing large roomy blood mares to scatter their progeny about the country and increase the size in that way?—The matter of importing mares should, I think, rather be left with the man who has a good financial basis, but the system we have adopted was rather to build up the type of horse to a greater size, because it was only the local market that we were breeding for. About ten years ago the market demanded large horses. We bred them, and then later on the market wanted smaller horses with more stamina. These we bred also, and to-day the demand is for a large horse again. So it is the local market that has interfered with systematic breeding.

4643. But so far, your experiments in getting size have been entirely at the expense of stamina and endurance?—Yes.

4644. So it is quite plain that other steps will have to be taken if you are to enter into competition with the world's markets?—Yes.

4645. Has the Government any stud farm?—Yes, but unfortunately they are abolishing one in the near future in the Free State.*

4646. Does the Government import sires or own sires for the use of the horse-breeding community?—The past system, especially in the Transvaal and Free State, has been that they have imported sires and had their own stud farms, and those sires have been leased to owners in those Provinces. We, in the Cape Province, have been neglected more than in the Free State and the Transvaal, but during this last season we have had the sires distributed more generally.

4647. But yet you have not done anything in the way of importing brood mares—large thoroughbred brood mares?—No. In a few cases private owners have done so.

4648. Because one would rather think that would be a potent way of increasing the size without losing the stamina?—Yes.

4649. **(Sir Rider Haggard.)** I have been talking about horses with some gentlemen here and they seem to think that a suitable cavalry remount horse can be reared here to pay at from 30*l.* to 35*l.*?—Yes.

4650. And what do you estimate the cost of landing that horse in England would be?—I do not know.

4651. They seem to think also that any number of horses can be bred in this country?—Speaking of our national resources in that respect, I may mention that this district is specially suitable for breeding horses. We have practically no diseases, the chief disease in this country is horse sickness, and we have not to contend with that in this part of the country. At odd times we do have cases, but the cases are so few that horse-breeding is a profitable concern if carried out properly.

4652. Not only here, but in the Orange Free State and in the Transvaal. The Wakkerstroom District I am told, is one where horses can be bred very satisfactorily?—It depends on the style and class of horse you want. We find that if you have a sandy soil the hoof of your horses is inclined to spread out, and become flat, but where you have mixed veldt, the hoof develops better, and you get a hardier hoof. A foal on hard veldt has a better quality of hoof than a sand veldt horse.

4653. Is there a large area of suitable veldt for breeding good and useful cavalry horses in this country?—I should say so.

4654. And the gentlemen I was speaking to estimated that you could turn out here in this district† alone from 20,000 to 25,000. Do you support that estimate?—Yes. For instance, we are ourselves at

* Witness's Note:—I have just ascertained that another is to be abolished.—29 March 1914.

† Griqualand West.

present breeding our stock of mixed horses running to about 210. That is one private individual. There are others who are breeding perhaps more than that—up to 300 and 400.

4655. I mean to say, could the stock be increased so that the district could produce, say, 20,000 horses a year?—I have not gone into probable numerical results.

4656. Could a large number be produced?—Yes.

4657. Because when you are asking the Government to charter ships, there must be the supply available?—Yes.

4658. If that is so in your district*, in the other districts you are acquainted with in the Transvaal and Free State, could a large number more be produced?—Yes.

4659. If there were a satisfactory market?—Yes.

4660. Are you of opinion that a horse suitable for cavalry remount purposes can be bred here?—Yes, I should say so.

4661. Do you think that those horses, if bred here and taken to England, would stand the English climate?—Yes.

4662. Do you think there is here a great ground for breeding horses for army purposes for use in England and also in India?—Yes.

4663. And in that way a constant supply of remounts could be assured if the matter were taken up on the proper lines?—Yes.

4664. And with proper precautions as to the sires used and the stock of mares?—Yes.

4665. **(Chairman.)** You say that the Government has now stallions?—Yes, they have their own stud farms, and they have been breeding their own horses and these young horses have been offered periodically at public auctions, whereby private farmers are able to buy the horses they fancy.

4666. What is the origin of these Government stallions; are they country-bred?—No, mostly imported.

4667. What type of horse?—Mostly the thoroughbred type. That has predominated. About seven-eighths last year were thoroughbred.

4668. Bought in England?—Yes.

4669. And they stand at what figure?—It depends on the quality of the horse. The stud fees were various—ranging from 30*l.* to 50*l.* in the catalogue.

* Griqualand West.

4670. What is your opinion of the horses which the Government provide in that way? Are they suitable to the country and suitable to the reproduction of the type of horse you want?—As far as our past experience has been, speaking of twenty years back, when our Government imported some sires, some of them certainly did not prove very successful. But I should say that the type of horse which our Government is now importing is a very suitable type.

4671. **(Sir Jan Langerman.)** In times gone by, South Africa used to supply remounts to India you say?—Yes.

4672. On a large scale?—Yes.

4673. The type of horse required for India is not the type required for the United Kingdom, for instance?—No.

4674. You must have a smaller horse for the Indian requirements, I understand?—Yes, the type of horse is certainly somewhat smaller and also hardier. It must have plenty of stamina, and our horses have those qualities.

4675. You are of opinion that you could breed both types of horse here successfully and in large numbers?—Yes, I feel convinced of it. What we want, however, is a certain outlet for our horses. We can easily meet the demand.

4676. Do you know whether the Government has taken any steps to recover the Indian market for South African horses?—I am afraid the steps they have taken, if they have taken any at all, are very visionary. I do not think that any very serious attempts have been made to recover this trade, which was quite considerable at one time, so I understand.

4677. We had the market in the past, and we have allowed Australia to take it away; is that the position?—Yes. Australia supplies the bulk of the remounts now, I understand.

4678. And you think that with judicious handling we could recover the market again?—Yes. We see no reason why not. That is what we are agitating for now.

4679. **(Sir Rider Haggard.)** Can you breed horses fitted to draw guns? You know the style of horse, the heavier type?—Yes, I think so.

4680. What do you use for that purpose, Percherons and Clydesdales?—Percherons and Oldenburgs.

ORANGE FREE STATE.

Bloemfontein, Friday, 20th March 1914.

Mr. S. E. GASSON called and examined.

4681. **(Chairman.)** You are interested in wool?—Yes.

4682. Will you kindly tell the Commission the points which in your mind are important in regard to this subject of wool-growing. I believe the principal point was the method by which wool was purchased from the farmers. It has been said that previously it was purchased without regard to quality?—As long as I have known the Free State it has always been purchased according to quality. In Bloemfontein it has always been purchased on its merits. In years gone by I daresay that the practice of buying wool without regard to quality was too prevalent, and no doubt it exists to-day in some of the outlying districts where people have very little knowledge of the article. But competition being so keen, and the article now being sold on its merits in the larger, I will not say only the largest, centres, the farmers who have good wool invariably send it along to those centres. The farmers realise that wool is now being purchased on its merits, and consequently they are going in for a higher class of sheep. They are going in for imported sheep and different people are endeavouring to improve the rams. Personally I have imported a lot of stud ewes and stud rams in order to be able to give the farmers a better class of ram to improve the quality of the flocks and at a reasonable figure. The smaller farmers cannot afford to import sheep, and, of course, that has kept them back for many years. The high prices ruling possibly prevented them from making the forward and progressive steps that otherwise they would have made. But that idea that wool is not purchased on its merits is entirely wrong.

4683. As a matter of fact, is the quality of wool now produced in the Free State rapidly improving?—Yes, it is rapidly improving. The improvement since the termination of the war has been most marked.

4684. Has the industry been much affected by the recent drought?—Well, of course, in the Cape Colony the drought has not been so severe, in fact they have had very good rains, and as far as I have been able to gather from the coast houses the wools are arriving in excellent condition. Speaking for this district the wool has suffered severely.

4685. Do you advocate any special measures for the more rapid improvement of the quality or quantity of the wool?—I do not know. I think all the farmers, at any rate the progressive farmers, realise that the more wool they can make their sheep carry the better it is for their pockets, and they also realise that wool suitable for the ordinary trade is necessary, and under those circumstances they are taking measures not only to improve the wool, but also to improve the method of handling the wool, so that it should be in a marketable condition. For instance, in years gone by, they were in the habit of running their coarse Persian sheep along with the merinos, and the consequence was that some of the hairs of the Persian sheep got into the merino wool, and when the wool arrived home, and it was dyed by the manufactnrers, there were marks in the fabric caused by these white hairs which would not take the dye. In consequence of this South African wools got a bad name, but we may say that that is almost a thing of the past. At the present time Cape tops are realising as large a price and even more than Australian tops.

4686. **(Sir Jan Langerman.)** What is your experience in the Free State?—My experience extends from 1891. I came here at the time the railway was made.

4687. Since you came here has there been a marked increase in the value of wool in the staple and in the length and in every other respect?—The wools have improved considerably. The quality all round is very much better, in fact we have nothing to be ashamed of.

4688. And also the class of sheep?—Certainly.

4689. How does it compare with the Transvaal and the Cape Colony?—Of course, you must take the different districts separately; out west it is very difficult for them in that very dry sandy part of the country to produce a wool of a character to compare with the wools that can be grown down in Kaffraria, in fact we cannot do it. The heat is so great that the wools become dry at the points. You have doubtless learned that in going round the country, that the finest wools are produced in the Eastern Province and in Kaffraria. Those clips compare, I may say, very favourably with Australian clips of same count.

4690. How does it compare with Karroo veldt sheep and grass veldt sheep?—My experience is that where you rear them on grass the wool will naturally show less dust, and, if you wish to know the price per lb. in the grease, they are lighter, and the waste is not so great. Consequently, although the wool may not be worth any more in the top, nevertheless in the grease it is worth considerably more, because there is less wastage. That is the position.

4691. In regard to the Free State, which you are familiar with, is there much room for expansion in the sheep-raising industry?—I should think they could increase their numbers considerably, especially if they did away with a number of cattle. Now, it is rather departing from the question of wool, but I may tell you that I am not only interested in wool, but, I suppose, as an amateur farmer, I am fairly interested in cattle. I am interested in the growing of wool on a fairly large scale as well as the raising of cattle. Well, I have come to the conclusion, in fact, I spoke to one of my partners just recently, and said that I felt that with the dry times we were getting now this portion of the Free State is more adapted to sheep than cattle. A sheep can do with short pasturage, whereas you want length of grass for cattle. I also go in for imported cattle. I run about 8,000 sheep.

4692. Are you obliged to trek with your sheep in the Free State?—I shall have to do so, I am afraid, owing to the drought.

4693. Would you have to do so in a normal year?—No, the less the sheep are moved the better.

4694. It is not the same as on the high veldt in the Transvaal?—No.

4695. What is the number of sheep in the Free State?—I cannot tell you.

4696. You think it is capable of considerable increase?—I think so. I have not had any time to get figures, but I can easily obtain them for you. The loss this year, you may take for granted, will be rather severe in this part of the country. I have one property which is over 6,000 morgen, or nearly 20 square miles, and I do not think there will be any veldt to carry a single animal.

4697. You say you started in 1891. When did you start wool-growing?—Not until after the war.

4698. For ten years, say?—Yes.

4699. Taking the price of wool ten years ago and now, what is the difference? I want to see how the sheep have improved during that time?—You cannot take it in that way. Take, for instance, the years 1899 and 1900. You will probably remember that the prices of wool soared up to a great height and then there was a collapse, several suicides occurred, men were ruined, and prices fell pence per pound in a few months. So you get a sudden rise and fall. I do not see that the price has anything to do with it.

4700. But still the fleece of the sheep to-day all over South Africa is more valuable because of the introduction of better rams?—If you were to say that the sheep of to-day, compared with the sheep of the Free State fifteen years ago, have gradually improved I should say you would be perfectly correct. I suppose there has been an improvement in the weight of the fleeces, take it all round, at least 1½ lb. per sheep, and I suppose there has been an improvement in the quality, taken all round, of 1*d*. per lb. That is my own impression.

4701. That shows the improvement that has been made in sheep-breeding?—Yes, and also in the methods of handling the wool. Unfortunately, in the former days the farmers thought the correct thing was to throw everything into the bales, including stones and dirt, but to-day they realise that it is wool that is required and nothing else, and that if they put anything else in the bales they will have to pay freight and railage and home charges upon that dirt and rubbish.

4702. How have you brought up your fleeces during the last ten years in weight?—Of course, it would have been interesting to show you some of the skins so that you could see the difference. Fleeces are improved by putting the rams which are carrying the necessary fleeces to the ordinary sheep and gradually working them up year after year. You may have density and require length, then you will have to get a ram which is fairly dense but has good length. Others may have the length but not the density, and then you would put a ram which was carrying a denser fleece.

4703. **(Sir Rider Haggard.)** Do you think the country is carrying anything like the amount of sheep it could carry?—No, I think it could carry more, but I feel you would have to do away with some of the cattle.

4704. You think it is as highly stocked as it can be?—These parts of the country are more highly stocked than they should be. We have had three successive years of drought and we have been unable to get the animals fattened for sale. The farmers have been unable to get them into sale condition.

4705. You think the country is fully stocked?—In these parts—yes. I believe that out westwards there is no doubt they could carry more stock, but they want water, and they must go in for boring.

4706. Do most of these farmers make hay for winter and grow roots?—I would not like to say most of them, but the progressive ones do, but unfortunately this last three years it has been impossible to do anything in that way.

4707. But in normal years the progressive ones do?—Yes. Here is a point which may interest you. Speaking now as a farmer having an interest in this country, which I want to see go ahead, during the last few years there has been a great expenditure in wire fencing. Now, there is no doubt about it, that if you

fence a property properly, the carrying capacity of that property alone will be increased by 50 per cent.

4708. Why is that?—If you have a tract of country which is not fenced, you have the animals roaming all over that country, selecting the sweetest feeding and trampling out the rest, but if you have camps you can put the sheep into one and leave them till they have eaten what is there and then you can take them out and allow the camp to rest, and so you go from camp to camp. If you notice the country which is fenced as you pass through it, you will see the line of my argument. I am not speaking theoretically now; I am speaking practically. That is what we are busy doing ourselves—camping and finding water.

4709. I think you told me just now that only the progressive farmers grew winter feeding. So if that is so, those who do not grow winter feed, can only carry so many stock as the winter veldt will support?—Yes.

4710. That is largely the case throughout the country, is it not?—Yes, this year, inasmuch as we have had no rains, they have been unable to grow winter feed.

4711. But those who do not grow winter feed can only carry in summer as many sheep as their farms will bear in winter?—That is so.

4712. That is very largely the case?—Yes.

4713. And, therefore, the country is not really stocked to its full capacity, on the supposition that each farmer grew a proper proportion of winter feed?—No. This country is in the progressive stage. I will point out another thing. On two of my farms I have been attempting to get irrigation schemes carried out. Well, I have a gas suction pumping plant erected about three months ago, and I almost have the weir completed on the Modder River. I had to use the crops which were growing to carry the stock through the summer months, when we should have had good veldt, and I shall now have to remove my stock somewhere else because there is nothing left. I have just succeeded in getting the irrigation scheme on a fair way to completion, and I hope that very soon we shall be in a position to laugh at the drought. With the three years of drought we have had it has been impossible to keep one's animals in condition to get the work forward as well as one could desire. In December, January, and February, there has been no water in the Modder River at my place. Just recently my manager had to send 2 miles away to get some water from a windmill, and he decided it was the best thing to send his family to the Cape for the present. This drought has been exceedingly severe.

4714. These are sad accidental conditions which we hope will not be repeated. But I am talking of the general position—that a great many farmers do not grow enough food to be used in winter?—That is quite true.

4715. And therefore you cannot say that their farms are fully stocked, because they would only naturally be stocked to the carrying capacity of which they would be capable in the winter months?—Personally, I think that a farm is fully stocked if it has as much stock as there are foodstuffs to feed it. If you ask me if it is possible by means of irrigation and fencing, and improved methods of that kind, to carry more stock I should agree that it was.

4716. By growing hay?—Yes, there is no doubt about it—it may be that you could carry double, but it is no good saying that you could carry that quantity to-day. You could not.

4717. **(Mr. Campbell.)** When you spoke of the practice of wool-buying that was condemned in Cape Town as not being prevalent here, were you speaking of the Bloemfontein centre, or generally of all the small towns throughout the Free State?—I am only alluding to the very small places. I say in the larger centres—you can take Bloemfontein—and the progressive towns up-country, competition is so keen that although the storekeepers may not have the benefit of a great knowledge of wool, they have some idea of the value, inasmuch as they have sent down clips for several years, and I presume they make a note in their books that such a farmer's wool has realised so much, and another's so much, and they know the difference in the price. At the coast itself, every bale of wool is sold on its merits.

4718. But in the small towns practically all the buying of wool is done by the storekeepers, is it not?—To a great extent, but if a man has a very fine clip of wool and he feels that he is not getting a fair price for it, he will send it down to the coast himself, or to some other centre where there is competition. You see here in Bloemfontein there are two coast houses represented—W. Lane & Co., and my own house.

4719. But in the small country towns the storekeeper does buy the wool, and I suppose the small farmer who has not an expert knowledge of wool has to sell to him?—Yes, I suppose so.

4720. And I suppose that the buying in such a case will be a rather "happy-go-lucky" sort of business, and not so much a case of selling on merits?—Yes.

4721. I think that was the whole substance of the statement made to us in Cape Town?—Yes, I suppose they buy with the little knowledge they have. I have had a storekeeper send in two lots of wool, and he has discovered that he has paid more money for the inferior wool than the superior.

4722. Another matter out of which the question arose was that of classing the wool. It was a reply to an allegation that the classing of wools was very indifferently done among the majority of farmers in the Cape Province and elsewhere in the Union: is it a fact that the majority of the smaller farmers do not know much about the getting up of their wool for sale?—That is so.

4723. Could you suggest any means by which the farmers could be made to understand the value of getting up their small clips in a better way?—My own opinion is this, that if the farmer would only, as I have told them, keep out the dirt and dirty parts of the fleece, and if they have inferior fleeces such as from old ewes, keep those on one side, and so keep their wool as uniform as possible, that would be quite sufficient, and they need not worry. Because the whole fleece can be laid out by the manufacturer, and if the farmer begins dragging the fleece about without understanding it, it creates trouble.

4724. Do you think there is any means of giving technical instruction by means of Government experts or technical schools?—I do not think so. They would not attend such schools. But I do think that the agricultural shows assist them materially. They come across progressive farmers and see what is happening. They see wool exhibits, and chat with one another, and in this manner ascertain what they should do.

4725. You spoke of the great improvement that has taken place in the quality of the wool as produced from the sheep in the Free State. Does that apply to the Free State generally?—I think so.

4726. And have you reached anywhere near your limit in selection or breeding for the production of the finer types?—No, I do not think so.

4727. You think there is still room for improvement?—Yes.

4728. And having that in view, and seeing that you have already beaten the Australian record for fine tops in price——?—No, I do not say that. I mean to say that at the present time, if you take the Australian 64 tops you will find that, if anything, there is a better demand for the Cape 64 tops than the Australian.

4729. Did you not say you realised better prices?—If so, it would only be fractional. There has been a little more demand, but I do not think that is a point worth much consideration. The point is that they were on a par with the Australian in the 64 class.

4730. Now, having that in view, it appears to me that you have a very promising future for the wool industry here, and you have rather implied that it is not capable of very great expansion in the Free State under present conditions, but by means of irrigation and growing artificial feeding crops, is there not room

for a considerable expansion of the industry here?—Yes.

4731. And would the same thing be true generally of the other districts in the Union?—I think so.

4732. So that, altogether, one can look forward to a vast extension of the sheep-raising industry in South Africa?—Yes.

4733. **(Mr. Garnett.)** Has any of your wool been sold at the auctions in London?—Yes, a little.

4734. Are you satisfied with the prices obtained in London; does the wool realise satisfactory prices?—Now you are touching on another point. As you are probably aware dock charges have gone up at Home, and at present less and less wool is finding its way to London; it is going more and more direct to the factories.

4735. Has your trade with Bradford increased?—It varies.

4736. We have had it in evidence at Cape Town that some half million's worth of the best wool found its way to Germany; is your trade with Bradford showing an increase or not?—At present Bradford wants wool.

4737. But, speaking generally, are you maintaining and improving your connection with the West Riding for South African wools?—Well, that is exactly what we are doing, and what we are striving for all the time. We are striving to produce a wool suitable for the Bradford trade.

4738. And with a fair measure of success, I take it?—Yes. There is one point I want to mention in regard to what I referred to just now about the fineness of Cape wools: I do not want you to take away the impression that we are competing in the seventies, eighties, and nineties spinning counts. We are not. I was speaking of the sixties.

4739. **(Mr. Tatlow.)** Do you find that the growing of fodder to help the sheep through the winter is increasing among the farmers?—Yes, distinctly.

4740. Is the number of farmers who produce on a small scale increasing also; is there a larger number of farmers engaging in the trade?—Yes, I think so.

4741. I suppose the drought of the last few years has taught the desirability of providing winter feed?—Yes. I speak from my own experience. It has always been our endeavour to grow ample foodstuffs, but this recent drought has made it impossible.

4742. Your winter is very short?—It is quite long enough.

4743. It does not mean growing a great deal of fodder?—Yes, it does. When you speak of the winter you speak of the dry season. We may get some rains in April and may get nothing more until September or later—if we get them in September we are fortunate. Last October we had some, and everybody thought there was a happy future before us, but that was the finish of our rains.

4744. **(Chairman.)** What is the total number of sheep in South Africa?—I have no figures.

4745. I have been given 35,000,000; I understand the figure is 93,000,000 or thereabouts in Australia?—Yes, about that.

4746. If that is so, how is it that you only produce about one-sixth of the total output of Australia?—I think that is easily explained, presuming that the figures are correct. You see there is still a great number of Cape sheep in the country. Then we are not on a par with Australia in the quality of our sheep generally. We are still importing sheep from that country and are constantly trying to get up to their standard. We are already up to their standard in a number of wools, but I do not suggest we are up to them in the weight of our fleeces.

4747. Your fleeces are lighter than Australia?—I am afraid so.

4748. What proportion of lambs do you rear?—That depends. I have known a man with a small flock to rear as many as 90 per cent. But if a farmer has a big flock and dry years it is no unusual thing for him to have to cut the throats of the lambs in order to save the ewes.

4749. Does farming pay here?—You might just as well ask does business pay? It depends on who is at the head of it. One man succeeds and another fails. It is the man who has his coat off and his sleeves turned up who succeeds as a rule. And if he uses his brains in farming it will pay him well.

4750. Would closer settlement increase or diminish the number of sheep the country would carry?—Closer settlement with progressive measures to grow the needful foodstuffs will naturally increase the number of sheep.

4751. What is the explanation of the fact that South Africa has to import such a large amount of milk?—Honestly, I do not know.

4752. Is there any possibility of the country producing enough milk for its requirements?—I think so.

4753. There is no definite or distinct reason why she does not?—No, there is no reason except that she has not attained that stage when she has the necessary foodstuffs for feeding dairy cattle during the winter. In summer we have too much milk, and large quantities of separated milk are given to the pigs. The farms are too far away from centres to sell their milk and it goes to producing butter. That raises another point, and that is that it is very essential to get into this country a type of cattle that is rich in butter fat.

4754. **(Sir Rider Haggard.)** You go in for Frieslands very largely?—I have not personally, but I know a large number have gone in for them, because they like the parish pump, I suppose.

4755. Well, they are certainly not rich in butter fat?—On the contrary they are very poor. The cattle I introduced are the redpolls. They give from 4 to 5 per cent. of butter fat. If you have a good shorthorn, Redpoll, or Ayrshire, you get butter fat, but with the Friesland you may get 2·5. The difference is that the Friesland gives a very large and copious flow and the Redpoll gives a richer flow but less quantity.

4756. Next to the Alderney and Jersey perhaps it is the richest?—Yes.

4757. **(Mr. Garnett.)** In regard to the relative proportions of wool produced here and in Australia, I understand that during the last generation they have doubled the weight of the fleece in Australia. Have you done the same?—I could not tell you.

4758. We had it in evidence over and over again that during the past generation the Australian fleece had been doubled in weight or rather more, and if you have not done that it would no doubt account for the disparity?—I do not know whether it is as much as that. But I think that they have now as big a weight on the back of the sheep as they can possibly put, and a number of our sheep are in the same position.

Bloemfontein, Saturday, 21st March 1914.

Mr. C. McG. Johnston, Secretary to the South African Agricultural Union, called and examined.

(*For the evidence of this witness on "Forests,"* see *p.* 293.)

4759. **(Chairman.)** The subjects on which you are prepared to give evidence are the progress of agriculture and horse-breeding in the Orange Free State. We shall be glad to hear what you have to say. Let us have the main features first?—The main features in the Free State are, I think, really that we have made very marked progress in the merino wool industry during late years. We have improved not only the

quality of the wool but the quantity that our sheep are producing, and the prices we are now obtaining on the London market are proof of that improvement. Our difficulty I would say at the present time in connection with the industry is, of course, to eradicate the scab entirely from our flocks, and also to ascertain whether it is a sound policy to embark on exporting mutton. The present is a very abnormal year, but in normal years at this time practically all the stock in the Free State is fat and in good condition. That meat should be an asset to the farmers of the country. Then the sheep go into the winter, and about October particularly you find a great difficulty in obtaining fat meat in the country. Now, if the farmers can export their surplus stock of sheep when it is fat, they get the cash, and the country has not got to carry over this surplus stock through the winter when feeding is scarce, and the farmers are relieved of the difficulty of providing a large quantity of winter food. I am assuming that the type of mutton we can produce is suitable when it is in good condition for the markets of the world. Of course, it may be a question whether this part of the Union is really only a stock-raising country, and whether the grazing stock should not go to some other part of South Africa where mutton can be better fattened. This is a matter to be determined. Now regarding horses, as you know, under Crown Colony Government we introduced the thoroughbred into this country, and the policy has been carried on, with possibly less consistency than more, of endeavouring to grade up the horses of the country by use of the thoroughbred sire ; it is difficult to crystallise the results of that experiment to-day. I think a very fair percentage of experienced men will say that the thoroughbred sire is the best finishing horse you can get in the world, but you must get substance into your mare, and it would appear that the use of the thoroughbred sire on, I do not want to say the weedy mare of the Free State, but, anyhow, the light mare of the Free State, is liable to produce a type of horse which is too light or too weedy for Army or remount requirements, because although horse-breeding does not at present appear to be one of the most profitable forms of farming in this country, I think it is essential that we should look upon the national importance of the horse to South Africa for remount purposes. Not only for our own defence purposes, but with a view to the possibility of being able to open up markets for our horses elsewhere. At one time, I think I am correct in saying, South Africa exported horses to India ; well, we seem to be a long way from exporting horses to any country at present. As a matter of fact many farmers are trying to clear out of their brood mares, they do not find them quite as profitable as other classes of farming, and to me it appears that that is a very unfortunate state of affairs because the brood mare is a very important factor, not only in the Colonial life of the country, and not only in regard to the horse industry, looking at it from an economic point of view, but also to the national defence of the country, and I think the Defence authorities do not attach sufficient importance to the movement which is taking place in the horse industry. I have a very clear indication of the trend of things to-day in connection with this Agricultural Show which we are holding here a week hence. Our horse entries have decreased very much all round. I am not referring to pure bred sires classes, but to general horses suitable for remounts and for riding and driving. Of course, another important factor has been the introduction of the cheap motor car, the "Ford" more particularly. The farmer finds it more economical to buy a "Ford" car and do away with his horses. There are many farmers who ten years ago had plenty of horses, and to-day they have none at all, and they have practically no intention of having horses again. I might mention that the introduction of the Clydesdale and the Oldenberg, not the Shire to any extent and not the Suffolk, but the introduction of the Clydesdale and Oldenberg has gone forward rapidly in the last three years. A certain number of Percherons were introduced also, but they do not seem to have taken on. We have, I believe, tried practically every breed of horse with the exception of some Russian breeds. We have tried every known breed on the face of the earth, and we have probably tried too many. Regarding cattle, I happen to be Secretary of the Friesland Breeders' Association of South Africa, so I am perhaps more of a Friesland man myself. We have imported very largely, and we have been assisted by the Department of Agriculture, who lent us an inspector, a Hollander, who has inspected the Friesland cattle in the Transvaal, in the Cape and in Natal, and is now working in this Province. He reports that the farmers, as a rule, do not seem to be taking sufficient care of their young stock. The South African-bred animals are not showing up so well as we should like in comparison with the imported animals, but in comparison with British breeds the Friesland seems to be coming into the country in large numbers. Next week at the Show one breeder from Holland alone will have 24 head of North Friesland cattle. The only British breeding society that ever thought of doing anything in this direction is the Lincoln Red Society. Mr. Evans of Lincoln was out here some time ago endeavouring to introduce some of these cattle, but his efforts did not, I think, come to much. In this connection I would like to mention the subject of our relations with the British breed societies. From the Holland, American, or Canadian societies we can get practically any information or assistance that we require, but when we come to deal with the British societies, such as the Shorthorn and so forth, we do not get assistance. It would occur to one that the British societies are rather inclined to take up a superior position, and they do not help us. I might mention as an instance of what I mean—a few years ago we thought of forming a Shorthorn society in Bloemfontein, and we wrote to the Shorthorn Society in Great Britain asking them to send us a copy of their rules, and they replied that they had already sent one to Cape Town : they thought that was sufficient. Now, South Africa is a very large country, and it occurred to one that they might have been a little more generous and sent, say, half a dozen copies. I do certainly think that the British breeding societies might do a little more for us. I except the Royal Agricultural Society, against which I have no complaint to make.

4760. What other kind of inquiry have you failed to get an answer to?—We have corresponded freely with the breeding societies and we have had a good deal of difficulty in extracting information. I except the Lincoln Red Society, because they met us very fairly and supplied us with stud books, but generally speaking the societies at Home do not seem to have gone out of their way, as they might be expected to do, to assist us, because, after all, it is a purely business proposition. Holland does not do it for philanthropic reasons, they do it as a matter of business, they want to keep in touch with us. Now regarding cattle in general, we are getting a very good class of cattle out here but we are faced with one great difficulty, and that is in regard to this matter of tuberculosis. The onus of tuberculosis is thrown on the importer of cattle into this country. The cattle are tested on the other side but we do not find that to be sufficient. I am talking now about English, American, and Dutch cattle imported on a certificate. We have approached the Government to establish in England a quarantine farm station, where cattle would be quarantined for 30 days prior to testing, because it is one of the peculiar features of this test that if you buy an animal from a not too scrupulous dealer he may have doped the animal by a small injection of tuberculin, with the result that the animal does not react to the test in England or Holland but it reacts out here, and the farmer who imports the animal is the loser as reacting animals are slaughtered. It occurs to us that the way to get over that difficulty is to establish a proper quarantine station in England, and not a testing station as at present exists in England and Holland. Say that the cattle could be quarantined previous to being tested, that would be of more value to us.

4761. How long does this dope take to work off?—21 days about.

4762. Has any large proportion of these imported cattle been condemned?—Yes, I cannot give you the exact percentage, but we have had some very deplorable losses.* I know of one Shorthorn bull that the man paid 300*l.* for, and I believe it was destroyed at Cape Town.

4763. In regard to cattle for milking, do you see any prospect of an increased production of milk?—It is a very difficult question to answer at the present time. As a matter of fact we have over-stocked our creameries last year. We have, undoubtedly, made considerable strides not only in regard to co-operation among the farmers in supplying cream, but also in the improvement of our cattle. But this year has been very disheartening and the creameries are having a bad time. When we get normal seasons again I do not see why we should not export butter in large quantities. Many other parts of South Africa outside the Free State are good for cattle and they are helping in this direction, so I see no reason why we should not very soon be able to produce all the milk and butter we require for own consumption.

4764. What do you say regarding your fight against pests and diseases?—We have been remarkably successful. Only yesterday Sir Rider Haggard mentioned the difficulties which he had to contend with thirty years ago in this respect. In the Free State we unfortunately are confronted with the scourge of lamziekte. Sir Arnold Theiler has had the matter in hand for some time and two German scientists have been brought out to further investigate the disease, while Mr. Arthur Stead has been detailed at Middelburg, Cape Colony, for investigation. The losses from this disease ran into thousands of head during the last few years and the disease has paralysed the whole cattle industry in the west of this Province.

4765. What is lamziekte?—It is rather a difficult disease to describe. I do not know that it is possible to say exactly what it is at present. The appearance of the disease is something similar to the old stijf sickness. The cattle become paralysed in their front legs and finally go down and die. Very few animals recover.

4766. Is it tick-borne disease?—There was a theory to that effect, but it is probable, and the weight of evidence is inclined to show, that it is a deficiency disease, similar to beri-beri. Of course, as is always the case in these matters, scientific opinion is split into hostile camps, but there is a great deal of evidence in support of the theory that it is a kind of disease which is caused by some strange deficiency in the veldt. It is supposed that an animal does not get sufficient nutrition and that the food it obtains fails in some important constituent. I think in the case of beri-beri it was supposed to be produced by eating rice in large quantities for a very long period of time. I do not think it is due to deficiency in phosphates. Dr. Hutchins recommended phosphates and salt, but that has not been proved to be anything like a preventive.

4767. Have you anything to say specially regarding irrigation?—I do not come practically in touch with irrigation, but I realise it is a most important factor in our development.

4768. **(Sir Jan Langerman.)** You refer to lamziekte. How long has this disease been in vogue?—I have only known the Free State since the war and we have heard of it since then.

4769. And previous to the war?—Yes, in the western districts it was known previous to the war. Farmers report now, and have reported for the last few years, that farms which were formerly free from lamziekte are now affected, and districts now have it which did not have it before. A few cases have occurred east of the railway line where it was not known before.

4770. If it is due to a deficiency in the veldt, how is it that it only occurs now and not before?—I am afraid I cannot say: I am only repeating what the veterinary authorities and farmers have informed me; heavy stocking may account for it.

4771. Of course, it is very nice to look forward to the exportation of frozen meat, but what are our imports at the present time?—They are very considerable, I believe.

4772. So you will have a long uphill fight before you can hope to supply even your own country?—Well, in spite of all that I think we ought to endeavour to convert our surplus fat stock into cash, when they are saleable.

4773. In the face of this large importation?—I would not say it is a large importation of frozen mutton. It does not reach up-country. It is only as far as the coast towns are concerned, so I understand, and will soon cease, if it has not already done so.

4774. Now about the quality and quantity of the sheep. Of course, our stock in this country really dates from the war because during the war everything was destroyed?—Yes.

4775. We have only really begun farming properly since the war?—Yes.

4776. So that during the fourteen years the Colony has made immense strides in cattle and sheep raising?—Yes, it is almost incredible, I think, the strides that have been made.

4777. As regards the quality of wool on the fleeces since the war, what do you think has been the increase, say, during the last ten years in the way of fleeces?—I could only guess. I would rather refer that question to our sheep expert, but I should say that we have put on at least 1¾ lbs.

4778. Do you think that is a good increase?—I think it is excellent when you come to think that we are only just getting hold of the farmers and inducing them to get good rams. We are much indebted to Australia in this respect.

4779. And it has been through Australian rams that you have been able to improve?—I think so entirely.

4780. In regard to the sheep we are importing, do we not import Saxonys and others?—In this Province we are going in for Tasmanians and Wanganellas. We have had a large infusion of Wanganellas blood; they have been recommended for the drier areas of the west and the Tasmanians for Harrismith and the eastern districts.

4781. How far do you think this country has gone ahead regarding sheep farming. Evidence has been given that the sheep in the Free State could be largely increased provided that we did away with a certain number of cattle, which would imply that the country is fairly stocked. What is your opinion?—I should say the country is overstocked with a certain type. It is carrying the wrong type to a large extent. This type of animal is not good enough. Many farmers are keeping non-economic cattle and sheep. If they kept better sheep they would not only save their veldt, but to a large extent they would save money also. The same thing applies to cattle. That is one of the great

* The witness subsequently furnished the following particulars:—

TUBERCULOSIS.

Return of Imported Cattle from 1st January 1912 to 31st March 1913.			Return of Imported Cattle tested during Year ended 31st March 1914.		
Province.	No. tested	No. of Reactors condemned	Province.	No. tested.	No. of Reactors condemned.

difficulties, to induce the farmer to look on farming as a business proposition and to keep the kind of stock that pays him best. But until you can induce a farmer to keep books he will never know what is a profitable line and what is not.

4782. It is quite true that the farmer does not keep books. Now as regards sheep breeders and breeding rams to a large extent, am I right in thinking that they have orders booked two, three, and four years ahead showing that the people are anxious to get a better class of ram everywhere?—I can quote one case. Two years ago at our Show one farmer sold 3,000*l.* worth of rams, all or mainly to Free State farmers. That is one of the great reasons why this Show has grown with such great rapidity; it is such an excellent sale centre.

4783. So there is anxiety on the part of all farmers to improve their stocks and do away with the non-economical part of their farming?—Yes. I would say this, that I believe that by adopting a strong agricultural policy the Government can increase that desire, and can push it ahead much more rapidly than it would go otherwise by a natural effusion of time.

4784. What is your opinion about the Government Agricultural Department going into competition with the private breeders. You know that the Government have experimental farms all over the country where they breed not only sheep but horses, to a large extent. They have induced a lot of people to start breeding and then they have come into competition with those private breeders. Do you think that is good business on the part of the Government?—Well, I think that the Government is already abolishing the principle, but I think at the same time one should carefully consider the maximum of benefit to the people of the country in preference to the interests of any smaller section.

4785. But would not that discourage people from breeding stud animals for themselves and induce them to rely on getting stock from Government sources?—It might do so if the Government proved to be very successful breeders.

4786. I think the country should encourage private men to come forward and improve matters themselves. Do you not agree with that?—Yes, I understand the Government have already decided to abolish the stud farms and that the proposal has not been met by any protest or opposition on the part of the farming community, so that we can presume that the farmers are satisfied with the movement.

4787. **(Mr. Lorimer.)** I have only one question to ask you — is there anything about the Ford motor except its cheapness which renders it specially suitable for South African requirements?—Well, in the first place, they seem to be very well standardised. You can get the spare parts very readily and they are certainly standing the work of the country very well indeed at the price.

4788. Is the spring of the car specially elastic?—We are putting on shock absorbers. They strap the back springs. The cars certainly have their faults, but they will travel pretty well anywhere.

4789. Most of the roads we have ridden on are very good, but you must have some very rough roads in the country?—Yes, we have some very bad ones.

4790. I think you said the farmers are buying motor cars and giving up horses and some farmers have none at all. I suppose they must keep some horses for riding and driving?—No, they may perhaps keep a pony or two about the homestead, but many have given up breeding mares.

4791. They must have horses to work the farms?—No, they have only a riding pony or two, they work oxen.

4792. How do they manage in case of a break-down?—Well, then the bullock is requisitioned to bring the car home.

4793. **(Mr. Bowring.)** Do the farmers show any disposition to use horses in place of oxen now?—They do more or less. The introduction of the Clydesdale has started a few farmers ploughing with heavy horses, but, of course, it is a very difficult thing to do on a large scale. I come from a part of the country—Ulster—where we plough with horses always, but it is very difficult to get anyone except the white man to manage horses. The native is accustomed to kick oxen and treat them in a very rough fashion, and he wishes to apply the same treatment to horses, so they are faced with a very real difficulty there. In the Western Cape Colony they are accustomed to handling mules, but here we are accustomed to bullocks and they continue to work bullocks. You have a great difficulty in getting them to work horses properly.

4794. You think it is more a matter of labour than otherwise?—Yes.

4795. You think the heavy horses might do even better work than oxen if only they were in the hands of white labour?—I think it is quite possible, white labour having more intelligence than Kaffir.

4796. **(Sir Rider Haggard.)** You were talking with reference to the exporting of mutton. Do you know it is a very expensive thing to put up these factories? — I am afraid I am ignorant of the economical side of the question, but if the mutton is available the thing could probably be financed.

4797. In regard to horses, you were telling us about the breed of horses. Have you noticed in the advertising columns of your paper that the Government are apparently disposing of their stud farms at Tweespruit and Standerton?—They are now selling 59 horses at Tweespruit, including 21 thoroughbred stallions.

4798. Does that mean they are giving up breeding?—Yes, it means that they are abolishing the policy of leasing stallions to farmers, the policy inaugurated after the war; that was for the Government to purchase horses and lease them to farmers at 30*l.*, 40*l.*, and 50*l.* These approved farmers had to guarantee to look after the animals and to serve the farm mares at 2*l.* 10*s.* per service.

4799. What is the meaning of this movement; is the Government going to breed on some other system?—No, I understand not.

4800. Then it denotes the abandonment of Government stud farms?—It does. Their intention is only to retain, as far as the Free State is concerned, two thoroughbred horses and a few mares at the Glen Agricultural College for educational purposes.

4801. Then in future the country must depend on its own effort with reference to horses?—Yes.

4802. I take it that the Department of Agriculture now assumes that if anything is required on horse matters it devolves on the Department of Defence to attend to it. At any rate, it is practically breaking up its studs?—Yes.

4803. It is rather a serious matter for the horse-breeding industry, is it not?—Yes, I think so.

4804. You talk about breeding imported cattle; do you import many Redpolls?—In this neighbourhood we have a number, this is a good centre for Redpolls.

4805. You get them from Suffolk and Norfolk, I suppose?—Yes, Lord Cranford, Sir Aylwin Fellowes, and some of the other breeders.

4806. Do you find they are satisfactory stock?—Yes, the breeders are satisfied. They do well at the Show and milk well.

4807. Do they prove hardy?—Yes, their critics say they are rather more subject to ophthalmia than other breeds, but I do not think this idea is well founded myself.

4808. Is it likely to be a stock which will be largely increased in this part of the country?—Judging by the way they have increased in popularity among the small farmers in the States I should say, yes.

4809. Between the Redpoll and the Shorthorn, which is the most popular?—At present, the Redpoll is entirely or almost localised round this district. There are many breeders in other parts, including Rhodesia, who go in for Shorthorns.

4810. The Shorthorn holds most of the market?—Yes.

4811. In regard to this lamziekte, I understand it is a comparatively new disease?—No, I may have created a wrong impression, it has been traced back

to 1863, the first cases were reported near Grahamstown in 1863. It has never been a serious matter before, because it does not attack stock that are moving to any extent. Trekking stock do not get lamziekte, but of late it has entirely paralysed the cattle industry of the western part of this Province.

4812. Is the loss very heavy?—Yes, very heavy indeed. One man last year south of the town lost 35 head out of 150.

4813. Do the animals recover?—Very seldom.

4814. Does dipping affect it in any way?—The opinion of the veterinary people is no.

4815. Therefore we have a disease which is assuming vast proportions and which is not affected by dipping?—Yes.

4816. It must be tackled in some other fashion?—Yes.

4817. It has increased, I gather, very much of late years?—Yes.

4818. I never heard of it in the early days of South Africa?—The last five years it has increased very much. Men who are trekking large numbers of stock over to the west reckon they are safe until October from lamziekte, although they are going into a lamziekte country. It is, as a rule, prevalent in the summer, and they hope to get back before it breaks out, and, if not, they go off in the Kalahari direction and keep the stock moving.

4819. Here is a disease not caused by a tick or microbe, but something which has apparently resulted from the food conditions, and is increasing largely?—Yes.

4820. And which has a high mortality?—That is so, very high.

4821. What is the rate of mortality among animals attacked?—I could not say, but it is very high.

4822. The ones that escape, then, are the ones that are not attacked?—Yes.

4823. There is a danger, then, that it may take the place of these other diseases which you have conquered by dipping?—We hope not. Although it is spreading it is spreading slowly. We have heard of very few cases having crossed the line of railway going up to Johannesburg.

4824. Does it radiate outwards everywhere, or is it only certain veldt that is affected?—It appears to be only certain veldt. They have been endeavouring to discover what the disease was due to. They take an affected farm and fence it, and try to narrow down the area which has caused the disease, and they get closer and closer until they get a sufficiently small area where a minute examination of the veldt can be undertaken.

4825. Well, at any rate, it is a new danger?—Yes.

4826. Are you much afflicted with locusts now?—I have been in the Department of Agriculture as chief locust officer in this Province, and in times back we have had enormous invasions in the Free State.

4827. Is this the chief home of the locust in South Africa?—No, it is very difficult to say where the home of the locust is. Our ideas are purely theory. In 1894 we had an enormous invasion from the north-west. These were the red locusts of the coast and not the ordinary locust. Since then they have not returned. They confine their depredations to the coast belt, as a rule. Six years ago we were overrun again and we started buying locusts at so much a bag in the voetganger stage. We bought 8,000 or 9,000 tons. Next year we undertook arsenical spraying, and we were successful in practically eradicating all the voetgangers or nearly all of them. What we did not kill of the migratory locust, birds did. Now this last year there has been a small recrudescence of locusts which have hatched out in the Steynsburg district, coming from no one knows where, and it is just possible, unless the Government is very watchful and careful, that it may give rise to other invasions, but what the theory of the invasions is I do not think anyone is prepared to say.

4828. Do you think the locusts are one of your ten plagues which can be kept under, or are they a serious danger to the future of agriculture?—I do not think they are a serious danger to the future of agriculture, but it behoves the Department of Agriculture to be very careful and watch the locust invasions, because there is a strange feature which has cropped up lately. You know, of course, that in these entomological and scientific matters there is no such thing as an infrangible opinion The opinion of to-day is the folly of to-morrow, and *vice versâ*. We have a locust called the Danica. This turns out to be identical with the plague locust of Northern Africa, and our plague locust has crossed with it, with the result that some of the progeny demonstrate migratory tendencies and others do not. It may be that the migratory tendency, which is the danger, lies dormant for several generations and then shows itself again.

4829. Some take after the paternal and others the maternal?—Quite so, and it gives rise to an interesting subject for speculation.

4830. These locusts are comparatively new, are they not?—No.

4831. What is the first plague of locusts you remember?—I have been here twenty years and have known them all the time.

4832. Have any other fresh diseases started besides this lamziekte?—Yes, a new horse disease, but I know nothing about it.

4833. Is it amenable to dipping?—I do not know Sir Arnold Theiler is now investigating it.

4834. **(Mr. Garnett.)** You mentioned the great improvement in merino wool and also mentioned the desirability of starting an export trade in frozen mutton. But could you combine the two? The merino is not a butcher's beast, is it?—It is very good mutton. Surely a great deal of the imported mutton which people eat in England is merino mutton.

4835. What I mean is, can the merino, as a butcher's beast, compete with any of the Downs?—No. But the mutton which New Zealand sends, is, I suppose, largely a cross of the merino with the Dorset. Of course, it is a question for investigation whether we should import a suitable strain for the purpose. But it is a rather dangerous thing to talk about the importation of fresh blood. Our farmers are only too prone to try fresh strains, with disastrous results. We had a lot of damage done to our wool by the introduction of Lincoln blood.

4836. In your pursuit of mutton you might possibly deteriorate your very excellent wool?—Yes.

4837. I think it will be generally admitted that the merino sheep cannot compete as a butcher's beast with any of the Down sheep?—I think you are quite right there.

4838. In regard to your horse-breeding, I believe you had an export trade to India at one time?—Yes.

4839. Why was it lost?—I think Australia cut us out.

4840. I believe the Australian breeders captured the Indian market?—Yes. We held it in mules for some time.

4841. You are trying to improve the size of your horses?—Yes. But not as a policy. That is one of our complaints rather, I think, that we have no definite horse policy. We have a sheep and cattle policy but not a horse policy.

4842. There is no organisation on the part of the Government, or private individuals, or associations of individuals, to regain that market for remounts that you have lost?—No.

4843. Am I right in believing that your horses are possessed of wonderful stamina?—I should say the finest stamina in the world.

4844. Well, now, you are trying to improve the size, and to do that you apparently import a big heavy horse?—Yes. But any organised effort has been chiefly through the thoroughbred.

4845. How has that succeeded?—I am not a horse expert, but I do not think the thoroughbred is a good intermediate cross. He is a good finishing class, but you want some size and substance.

4846. You want to improve the size of your mares?—Yes.

4847. It is a generally accepted theory on the part of the breeders that the size should be on the part of the dam?—Yes.

4848. Then by trying to improve or increase the size of your horses by putting a big Clydesdale on to a small mare, you are breeding on wrong lines?—Yes. But how are going to get the size at all? We have a small mare, and you have to introduce the size from somewhere, and it appears to me that the only way is to put on a heavier Oldenburg or Clyde, and then finish with a thoroughbred sire.

4849. Is it too much to say that the policy of crossing those heavy horses on to your mares will result in loss of stamina?—I have no evidence to bear that out, because, I must confess, that some of these crosses look well.

4850. But would they go through a long day as well as your own cross?—I should not think they would.

4851. Have you imported any Holsteins from America?—Yes, we have had both Canadian and American Holsteins.

4852. How have they done?—I am afraid I have kept trace of none of them.

4853. You do not know how they answer for milk production or butter fat?—No, I am afraid I cannot say. Their records are, of course, more carefully kept than others, as a rule, but I have no information.

4854. **(Mr. Sinclair.)** Has the Government given any official reason for its intended sale of thoroughbreds?—No, we saw the Minister on the matter the other day, and we gathered from him that he considered that the horse-breeding industry had now reached a stage where it might be left to the endeavours of private breeders.

4855. They think that the time has now arrived for private breeders to step in and carry on the work. Is that a view that your agricultural societies concur in?—We have not met to discuss the matter, but have accepted it as probably the right method at present, there being no definite policy. Simply the use of the stallions, and what are they? 21 stallions in a Province like this, without any definite mare classing or grading behind it. I think it is rather questionable whether it aids us very much.

4856. Has the importation by the Government of thoroughbreds been productive of good results in the past?—The result is still controversial. I should say it had myself, but a good many people would say it had not. Of course, you have to remember that if you had not had Government stallions, you would have had a lot of absolute weeds.

4857. That would seem to indicate that good work had been done, and that it is a pity it is to be departed from?—The Government will reply that the horses remain in the country.

4858. But they are not bringing in any more?—No.

4859. In regard to cattle, has the Government imported stud cattle in the past?—Yes, we have had constant sales of Government cattle.

4860. Their importation, it goes without saying, has tended to improve the breeds?—Yes.

4861. Is that policy being continued?—It is being given up, I believe rightly, because the private breeder of cattle is now in a position to supply the requirements.

4862. I suppose your societies lay themselves out to try to educate the farmer to improve both the quantity and the quality of his wools?—Yes. We do our utmost in that direction.

4863. Is literature printed and circulated among the settlers with that object?—Yes. We hold meetings throughout the Province, and have lectures at these Shows, and we have started a system of holding examinations for young farmers for judging stock, and the merino examinations have been markedly successful. I think that undoubtedly we have improved the general knowledge of the country very largely through holding these meetings and examinations.

4864. Do you spread literature throughout the country on the same subject?—To a certain extent. We did so more freely in the past, but we are wondering now whether it is not better to get hold of the man individually and talk to him. The farmer reads little.

4865. And the result of all the efforts that have been made since sheep farming was taken up at the end of the war has been to improve both the weight and the quality of the wool?—Yes.

4866. Now, as to the destruction of imported animals that were found to be suffering from tuberculosis under the circumstances you told us of, is there no local quarantine area where valuable animals that have been imported could be isolated?—They do quarantine them out here prior to the veterinary test, but that does not help the farmer, as if the animal reacts to the test it is slaughtered. He has bought a wrong one and loses his money. It is very hard on the man who wants to improve his stock. We are informed that the breeders in England are not prepared to have their animals quarantined. If that is so, it will not tend to business.

4867. I understood you to suggest that some of the diseases that cattle were subject to to were due to deficient nutrition. Can you tell me whether the wool of sheep that are bred in this part of the Union has a tendency to go back if it is not reinforced by new imported strains?—I have no information. As a rule that part of the country is not carrying any very large number of sheep.

4868. **(Mr. Tatlow.)** Has your Government been in communication with the English Board of Agriculture regarding this quarantine which you think is so desirable?—Yes.

4869. Has anything resulted from that?—I understand the farm is almost ready.

4870. Has the English Board of Agriculture expressed any views?—The matter has been under discussion for the last eighteen months, but we can only get unsatisfactory information from our Department. We are told that the farm will be ready soon, and it seems to remain at that and get no further.

4871. Have you hope of anything being done in future?—We saw the Minister in Cape Town about three weeks ago, and we were promised that it might be in working order in about three months. In Holland, I believe, it remains a testing station only. It has been suggested to us that the sellers in England may not be prepared to have their cattle tested, because if they react they are thrown back on their hands. Of course, that argument touches our people also and touches them hard.

4872. **(Chairman.)** Are these farms you speak of in Holland and England?—Yes. We have asked for it in both countries.

4873. **(Mr. Tatlow.)** It is, of course, in the power of the Board of Agriculture to make any regulations which they may think necessary?—Yes. I would like to point out that it is going to have a marked effect, I should imagine, on the importation of bulls from England, because the farmers here are getting very nervous about it.

4874. It will have a deterrent effect?—Yes. I believe so.

4875. You spoke about the movement of sheep from one district to another for the purpose of fattening: is that largely in existence?—No. I suggested that it might prove on investigation that certain parts of South Africa would be more suitable for fattening sheep and cattle than, possibly, our part, and, therefore, that we might develop into a raising and feeding ground.

4876. That is not so at present?—No.

4877. Your mind has turned from the number of sheep you produce to the prospect of exporting mutton?—Yes.

4878. If that is the case how does it come about that you cannot supply your own home demand at present?—I am not certain that we are not supplying it now.

4879. I thought you said there was a considerable importation?—We had until just lately. I understand meat was being imported into the coast ports.

4880. Is that decreasing?—Yes. Not long ago we were living almost exclusively on imported meat, but if you compare the number of sheep in South Africa and New Zealand, the populations being about equal, you will find that they are exporting large numbers of sheep from New Zealand in the form of mutton.

4881. **(Chairman.)** How rapidly is the number of sheep in South Africa increasing; it is something like 35 millions now, I believe?—Yes, I believe so.

4882. Do you know how many it was five years ago?—No, but I believe it has increased.

4883. You spoke of oxen being replaced by Clydesdales for farm work in some cases; how do the two compare? A team of oxen would require to be replaced by how many horses?—On reasonably soft ground a pair of horses would, I take it, pull a single furrow plough, which as a rule requires from four to six oxen.

4884. There is no accepted formula for replacing oxen by horses?—No, I have not heard of any.

4885. About these motor cars that are being used for work in the country; have large wheels and large clearances an important bearing on the rough country work they have to do?—I do not know that they have. The Ford is going with ordinary tyres.

4886. And not specially large wheels?—As regards clearance, some of the English cars have not sufficient clearance.

4887. Is there no English type of car suitable for work here?—The cars chiefly in use here are the Ford, the Upmobile, the Buick, and in English cars I think the Talbot and the Austin are the most common makes.

4888. Horse-power for horse-power, the English cars are how much dearer than the American?—The Ford costs roughly 200*l.* and the Austin 500*l.*

4889. For similar horse-power?—No, I would not say that. I think the Austin is higher.

4890. **(Sir Rider Haggard.)** You have detailed the difficulties about the careless importation of animals which develop tuberculosis and the necessity for isolation and test stations, but could not the difficulty be got over by your buyers insisting upon receiving from the English seller a certificate that the animal had been subjected to the tuberculin test?—Yes, but that does not help, because if the animal has been doped on the other side it does not react to the test in England or Holland, as the case may be, and it comes out here on a clean certificate and reacts here after quarantine.

4891. In that case I submit that you have a right of action against the seller?—Even if we have, 6,000 miles is a long way.

4892. But these men are not men of straw; they can always be sued?—I do not know anything about that point, but some of our men who have lost these animals are shrewd, and they have, no doubt, thought of all that.

4893. Then the certificate is of no value—that is what it comes to?—Of very little, and very often of none.

4894. It is a very serious matter if these certificates issued by big breeders of pedigree stock are either erroneous or misleading—to use a mild term—it is a serious matter for both seller and buyer?—I take it that the procedure is often that the dealer buys from the breeder and arranges the test. I am told by men who are up in the business that squaring the veterinary surgeon's test is not unknown.

4895, It may be so. All I can say is that it is a matter which ought at once to be brought to the notice of the proper authorities in England, if it is true that they are squared.

4896. **(Chairman.)** Who is the officer chiefly connected with this matter?—The chief veterinary officer at Pretoria—Mr. C. E. Gray, and the assistant principal veterinary officer, Mr. J. Borthwick, both of Pretoria

4897. **(Sir Rider Haggard.)** If that is the state of affairs existing at the present time, it would not be too much to say that it is destroying confidence among buyers?—I certainly consider it is, and that is why we have been endeavouring to get the Government to move in the matter as rapidly as possible.

4898. In the case of stock imported from other countries are there the same difficulties?—We have the same difficulty in regard to America and Holland.

4899. And so it comes to this, that no buyer who pays large sums for these imported animals can be certain that he is not getting something that is fraudulently certified to be free from tuberculosis?—He cannot be certain of buying animals that will not react in South Africa—I will put in that way.

4900. Well, that is the same thing?—Yes, that is what it comes to, certainly. Men who have imported stock have come to the conclusion that they are never going to do it again under existing conditions.

4901. **(Mr. Garnett.)** Assuming that the dealer with fraudulent intent gave an animal bought from a breeder a dope, would it be possible, if one had that animal subsequently examined, say by a veterinary surgeon, to ascertain that it had been doped?—No.

4902. You do not assert then that all these are fraudulent veterinary surgeons?—No, I do not want to make any suggestion of fraud. I only want to draw your attention to the result of this.

4903. **(Chairman.)** The destruction of confidence?—Exactly.

4904. **(Mr. Garnett.)** The veterinary surgeon may absolutely *bonâ fide* give a certificate that an animal was entirely free from tuberculosis, which had been doped without his knowledge?—Yes, he might give it with absolute good faith.

4905. **(Sir Jan Langerman.)** As secretary of the Agricultural Society, you take a great interest, I presume, in the financial requirements of farmers?—Yes, a very great interest.

4906. What facilities exist for a farmer raising money to put into his property?—There is only the Land Bank.

4907. Suppose a settler came out and bought up a bit of land—it is mortgaged to the Government at once, and if he wants to start farming, what facilities exist?—I do not think any except the ordinary business houses and banks.

4908. The ordinary bank would not advance capital unless there was collateral security to a reasonable extent?—That is so.

4909. Do you not think there is a large opening in South Africa, and especially in the Free State, for the introduction of capital from abroad in the shape of agricultural banks?—I should think there is. That is one of the great difficulties of the small farmer—being unable to get money for development.

4910. And you think the business could be run on safe and profitable lines?—I do, if you choose your men with care.

4911. You think there is an opening for the introduction of capital in that direction?—Decidedly.

4912. And it would be of great assistance to farmers in the development of their land?—It would be of very material assistance indeed, and give a very decided stimulus to the farming industry in South Africa generally.

Durban, 24 March 1914.] Mr. J. REYNOLDS-TAIT. [*Natural Resources : Animal and Agricultural Produce.*

NATAL.

Durban, Tuesday, 24th March 1914.

Mr. JOSEPH St. G. REYNOLDS-TAIT, representing the Natal Tea Planters' Association, called and examined.

(*For the evidence of this witness on "General Trade Questions,"* see *p.* 165 *of* [*Cd.* 7707].)

The witness submitted the following memorandum :—

1. Tea, apparently, was first grown and manufactured in Natal in about the year 1862. From that point up to about the year 1880, however, the industry was only carried on in a small experimental way and the products from the gardens did not appear on the market in any appreciable quantity until about the year 1885.

2. In the latter year the Customs duty on imported tea was 6*d.* per lb. (prior to this period the duty had been as high as 7*d.* per lb.), and the idea of this Customs rate being a permanent one was a sufficient inducement for the investment of capital in the industry.

3. That the article produced was sufficiently worthy of the attention of those who understood tea was vouched for by the fact that a sample of Natal tea produced in 1883 on the Kearsney estates was valued by experts of the highest reputation on the London market at 2*s.* 9*d.* per lb. This was considerably above the average price of the same grade of tea grown in India at the same period. There was very little or no tea grown in Ceylon at this time.

4. At this period the price for imported tea paid by the consumer ranged from 2*s.* to 3*s.* 6*d.* per lb., inclusive of the duty.

5. In the year 1883 very considerable developments took place in the tea industry; several new plantations were opened up, and from this point the extent of the tea industry has gradually increased year by year.

6. That the ultimate effect of these extensions was beneficial to the tea-drinking community is shown by the fact that, owing to the increased quantity of locally-produced tea being put on the market, the price of tea from all quarters fell from 2*s.* to 3*s.* 6*d.* in 1883 to from 1*s.* to 1*s.* 6*d.* in 1904. Of course, the price of tea on the "world's market" had fallen during the same period, but not to the same relative extent.

7. Natal tea is now sold to the consumer at from 9*d.* to 1*s.* 3*d.* per lb. according to quality.

8. In 1904 the duty on imported tea was reduced to 4*d.* per lb., and collaterally with this a duty of 15 per cent. was imposed on wood imported for packing purposes and of 25 per cent. on all printed matter used in the business.

9. In the year 1913 the importations of teas from overseas into Colonies within the Customs Union amounted, in weight, to 6,396,000 lb., of a money value of 297,000*l.*

10. The yearly consumption of tea in the Colonies within the Customs Union at present amounts to nearly 7,000,000 lbs. That the tea estates at present in existence in Natal are capable of producing very considerably more than this quantity of tea, and that the Colonies would benefit, directly and indirectly, by the further development of the tea industry, may be gathered from the following statement of the returns of the industry for 1908 :—

Total amount of capital at present invested in tea in Natal	343,000*l.*
Number of acres of tea planted not in full bearing	1,173 acres.
Number of acres of tea planted in full bearing	4,600 acres.
Number of acres capable of producing tea on present estates not yet planted	12,705 acres.
Estimate of yield for year 1908	2,139,800 lbs.
Estimate of yield when all tea land on present estates is planted and in full bearing	9,824,000 lbs.

11. In consequence, however, of the rise in the price of labour consequent upon the prohibition of indentured Indians entering the country, a rise which is estimated at quite 75 per cent., some of the younger estates have abandoned tea and devoted their capital to wattle and sugar-planting, both of which industries can better afford the higher price of labour.

The yield for the 1913 season fell to 1,687,729 lbs. and 780 acres have either been abandoned or utilised for other crops.

Native African labour is quite unsuitable for tea-picking, which requires a more refined sense of touch and a greater manual dexterity than can be hoped for in the Bantu races.

The wages of indentured Indians ranged from 10*s.* per month for the first year to 14*s.* for the fifth year, which terminated the first indenture. The second indenture started at 14*s.* per month, rising 1*s.* per month per annum. These wages, of course, included rations, housing, and medical attendance.

The ruling rate of wages to-day is from 25*s.* to 30*s.* per month with quarters, food, and medical attendance.

4913. **(Sir Alfred Bateman.)** You have had about fifty years of growing tea ?—Yes.

4914. But until the last thirty years it has been of no size ?—Yes.

4915. And then you speak of Natal tea in 1883 that had a high reputation. What tea does that most closely approximate to in its qualities ?—Assam.

4916. Is it a high coloured tea ?—Yes.

4917. Is it very astringent ?—No.

4918. Is there any great proportion of tannin ?—Less than any other tea in the world, I believe.

4919. Well, that should have got you credit ?—Yes, but it has a rather peculiar taste.

4920. Is it used for mixing very largely ?—Yes.

4921. Is the tea you use here mixed ?—Yes, principally with India and Ceylon tea.

4922. You get your tea about as cheap or cheaper than in England, I believe ?—Yes.

4923. With only a duty of 4*d.* per pound ?—Yes.

4924. Does that keep out the imported tea much ?—No. Of course, there is not sufficient local production for our requirements—putting aside the question of the peculiar taste. There is so much imported and sold under well-known brands, such as Mazawattee, that people will continue to have that. There is an import of over 100,000*l.* worth every year.

4925. In 1913 the importations of tea from oversea countries within the Customs Union amounted to a money value of 297,000*l.* ?—Yes.

4926. And what is your production now ?—Our production has been only about two million pounds. And for 1913 it will be less than 1¾ millions. The consumption is seven millions.

4927. Wattle and sugar-planting has rather decreased the amount of tea grown ?—Yes.

4928. I rather gather it is a question of labour ?—Yes, tea cannot afford to pay the high price of Indian labour, and African labour is not of much use.

4929. Cannot the children be taught the work ?—Yes. The children did a lot of tea-picking, but their parents are now going into the sugar and wattle plantations, where they receive higher wages. You cannot take the children only into the tea industry.

4930. What remedy do you propose ?—I am afraid there is no remedy. I am simply putting the question before this Commission without any hope of redress.

4931. I suppose the only remedy is beyond our reference, is it not—higher duty—which we are not allowed to consider?—Quite so. It is only interesting, possibly, to you gentlemen as one of the effects of the stoppage of immigration from India, and, I suppose, of interest to the general public to know what they are paying for their fads. They are paying considerably more for imported tea than they could get Natal tea for.

4932. Well, Natal tea is 1*s.* 3*d.*; what do they pay?—1*s.* You cannot land tea into South Africa to-day at less than 1*s.* wholesale. The price of tea in Ceylon to-day is 8*d.* or 8¼*d.* There is 4*d.* duty and another 1*d.* for charges. You cannot land it to-day at under, say, 1*s.* 1½*d.* per lb.

4933. But if there was a bigger demand for the tea do you think you could grow the other kind of tea without this peculiar flavour?—No, I do not think so. All Natal tea tastes the same when it is drunk as it is without blending.

4934. So you would have to educate South Africa to the taste of your tea?—Yes, that is so. Of course, a lot of it has already been done. A lot of Natal tea is sold in packets without blending. And in a tea-drinking country like this, with its freedom from tannic acid, it can be drunk all day without harmful effects.

4935. Do you know what is called Paraguay tea, otherwise maté, in South America?—No. I have not heard of it.

4936. It gets no market here?—No.

4937. There is a paragraph in your memorandum, which I do not understand, about wages. You say the wages of the indentured Indians include rations. Do you mean that rations, housing, and medical attendance are given besides?—Yes.

4938. What is the last paragraph as to the ruling rate of wages paid to-day?—You will notice that the verb "range" is in the past tense. Before the stoppage of Indian immigration they were indentured at 10*s.* per month, rising 1*s.* a month during the term of the first indenture. After five years they could then re-indenture at 14*s.* to 19*s.* Women were paid half, and children according to age. That immigration is now stopped, and instead of paying 14*s.* a month for time-expired men we have to pay 24*s.* or 25*s.*

4939. That is nearly double the wages. That must be very bad for the industry?—Yes, only the old-established firms who have their labour up to a very high state of efficiency can afford to keep on.

4940. **(Mr. Campbell.)** I see you have 1,173 acres not in full bearing, 4,600 acres in full bearing, and 12,705 acres not yet planted. Is that the total area available in Natal for tea-growing?—No, that is the area held by the present growers, and land which is lying fallow. I expect it will never be used.

4941. You estimate that when all the tea land belonging to the present estates is planted you will have about 50 per cent. more tea than the consumption of the Union?—Yes.

4942. Would you be able to export that?—Yes, to the London market for blending, particularly the cheaper grades of Souchong.

4943. What is the objection to Natal tea that you require to mix it with Ceylon?—Peoples' taste. It has a very peculiar taste. It would be interesting for you to taste it. It is very noticeable and takes some getting used to.

4944. Has the Indian tea had the same history in this country as in Australia—that it displaces China tea?—Yes.

4945. The taste here is for Indian or Ceylon tea?—Yes.

4946. If you could export this surplus to some other country, why is it that you require any further taxation to enable you to develop the industry?—We should only require to protect our local market and dump the surplus. We should not require any further protection.

4947. Would your export of tea be a dumping process?—Practically.

4948. And according to that you have very limited opportunities for tea-growing?—Yes, there is only a certain belt on the coast which is available.

4949. Dumping is a most unprofitable kind of business, is it not?—No, it is to keep your local price up. Take Australian sugar, for instance, dumping serves to keep the price in Sydney at £9*l.* a ton all the year round.

4950. Is there not a vast difference between the dumping argument as applied to manufactures and as applied to primary industries?—You can scarcely call this a primary industry.

4951. Your costs do not come down in the same proportion as those of the manufacturer?—They do come down to some extent.

4952. I think you will admit that dumping in regard to a primary industry is rather a freak?—But can you call tea-manufacturing a primary industry? There is a great deal of difference between the tea bush and the finished product. It goes through a lot of different processes.

4953. **(Mr. Tatlow.)** You produced a larger amount in 1913 and imported over 3½ millions. Allowing for what was consumed here, was the rest exported?—Yes, practically, and you must understand that not the whole of Natal tea that is produced is sold in a pure state. Even local growers import tea for blending.

4954. You must have exported over one million pounds, according to these figures?—You must understand that the Union does not include Rhodesia. We export a lot to Rhodesia.

4955. The balance was practically all exported?—Yes.

4956. Is it your contention that with the present means of production, conditions of labour, wages, and so on, that the planting of tea is not a profitable business?—Considering the rise in the cost of labour it is scarcely profitable, except for those factories which have been established so long that their machinery and labour are highly efficient. I quote as an instance one plantation which had expended a large amount in planting trees for four years and never produced a pound of tea, because it is not till the fifth year that the first crop comes along. Well, after waiting all those years they decided it would be better to plough all the tea in and grow wattles. Their labour was not efficient—it was efficient for weeding and planting, but not for picking. They recognised that if they doubled the price of their labour it could not pay them, so they gave it up.

4957. **(Mr. Sinclair.)** Can you tell us how much per pound imported tea has been increased by the stoppage of Indian immigration?—I do not know that the stoppage of Indian immigration has put up the price of imported tea, but the price of tea has increased in India and China—quite apart from the stoppage of Indian immigration here.

4958. I understood you to suggest that one result of that stoppage was that the cost of tea imported here had increased?—No, not necessarily, but if they buy imported tea instead of locally-grown tea, of course, it is dearer to the consumer.

4959. Meantime there has been no increase in cost?—I do not think so, outside the well-known brands; the bulk of the tea is only brought in by a few wholesale firms, and I do not know whether their prices have gone up. Practically every grocer has his own brand.

4960. **(Sir Jan Langerman.)** Is tea-growing in general a profitable occupation at present?—No, it is not.

4961. Do they work at a loss, or what?—No, although I think that even some of the bigger firms are running at a loss.

4962. Even when working on a large scale?—Yes, but they eke out with sugar.

4963. That is due to the wages you have to pay to the Indians?—Yes.

4964. You could not set Kaffirs at that work ?—No, the Kaffir can only pick 19 lbs. per hand per day, against the Indian's 25 to 30 lbs.

4965. So the whole question hinges on the wages ?—Yes.

4966. Unless you can get those wages reduced, there will be no advance in tea-growing ?—No.

4967. You anticipate that the acreage under tea will diminish as they can make use of it for more profitable cultivation in other directions ?—Yes.

4968. So we must look forward to tea as a vanishing industry in Natal ?—Yes, I am afraid so.

4969. And nothing will save you except getting cheaper wages ?—I do not think so. The only possibility is that a new source of labour for the other industries may be found, as, for instance, tropical natives—that would release a large number of Indians for the tea industry, and I think they would turn to that industry in preference to the others.

4970. The importation of foreign labour is out of the question ?—I am speaking of Nyassaland labour, for instance.

4971. That is foreign to the Union. You must keep that out of your mind. But should you overcome the prejudice against foreign labour, would Chinese do ?—No.

4972. There you would have cheap labour and very efficient for tea-picking. Suppose they were to be imported, could you not make a profitable use of them ?—Yes, I think so. I do not know how the rate of wages would run. Of course, the Chinese recruited for the Rand were paid a fairly high wage.

4973. They are accustomed to tea plantations in China ?—Yes.

4974. Would they not make good tea workers ?—Yes.

4975. Would you not advocate the introduction of Chinese to work this industry ?—Not if they were to be let loose on the country afterwards.

4976. Of course, I mean under control : you would not advocate it ?—No, I think not. We have enough complications at present.

4977. What other industries could you put on this acreage of tea which you give here—wattle-growing ?—No, maize, sugar, and anything that will grow on the coast belt with a high rainfall.

4978. So it would really be an advantage to let tea go, and to substitute in place of it sugar and wattle-growing, which would be more profitable to the country generally ?—Sugar would be more profitable for the time being, but it would not be ultimately. It will be as profitable as cabbages later on.

4979. Then you look also to the sugar industry going down ?—Yes, to some extent. It is being overdone.

4980. It will be a poor look-out for Natal then ?—We shall find other things, I suppose. I forgot in that connection to mention that under the Mozambique treaty its sugar goes into the Transvaal duty free. That will make a difference in the future if it is renewed. I do not mean to say that sugar will not be profitable, but it will not be any more profitable than market gardening. The whole of the Zululand coast has been taken up by sugar planters, and as soon as the supply exceeds the demand, the present high prices will have to come down.

4981. **(Sir Alfred Bateman.)** Is not the demand a long way from having reached its highest point ?—No, I think not.

4982. Will not the native consumers here consume a lot more in time ?—Oh, yes, no doubt in time.

4983. Would it not be doubled ?—I daresay it could, and probably more.

4984. Surely that means a very large market ?—Yes.

4985. Now, in regard to tea, you give the capital at present as 343,000*l.* You do not give any figure of the interest paid on that, or the yield on that ?—I have no figure. We have no compulsory statistical records here.

4986. I am sorry to say that your statistics are not as perfect as they might be ?—No.

Mr. D. Fowler, Vice-President, Natal Sugar Association, and Mr. Edward George Arthur Saunders, J.P., Managing Director, South African Sugar Refineries, Ltd., called and examined.

4987. **(Sir Alfred Bateman, to Mr. Fowler.)** You have been good enough to prepare a paper which I have only just got copies of. Will you please read it ?—Yes, it is as follows :—

The sugar industry during the last few years has undergone many improvements, both in manufacture and cultivation. The beginning of this advance dates back to about the year 1907, when improved methods of cultivation began to be felt, also the advantage of modern machinery, which the mills gradually erected. Added to this, more attention was given to the questions of chemical control and improved methods of manufacture, and consequently the subject is now better understood, and the importance of scientific knowledge more appreciated. Prior to 1907 only one mill in the Colony had any system of chemical control, whereas now it is becoming the exception for a mill of any size to work without a chemist.

The work of cultivation has also been studied, and more attention paid to proper systems of manuring, &c., and whereas up to about seven years ago the average crop of cane cut per acre was about 20 tons, this has now increased to about 30, *i.e.*, 50 per cent. more than it was. Also the improved results in mill work brought about by new and modern machinery and better control in the factories will be apparent by a glance at the following comparative figures, supplied by one of the largest estates, for seasons 1906–7 and 1912–13, from which it will be seen that the improvement has been very considerable, while the figures of cane cut per acre for the same period are also given :—

Mill Work.

Year.	Sucrose in Cane.	Glucose.	Purity.	Extraction.	Tons Cane per Ton Sugar.	Density, Beunne.
	Per cent.	Per cent.	Per cent.	Per cent.		
1906–7	15·98	·47	86·9	62·9	12·89	10·8
1912–13	14·09	·68	85·1	73·9	9·18	9·0

Cultivation.

Cane cut per Acre.—Tons of 2,000.

——	Acres Cut.	Gross Yield.	Average.
		Tons.	Tons.
Season 1906–7 -	2,337	54,137	23·16
„ 1912–13 -	2,910	89,090	30·6

It will be observed that the figures of mill work show that cane containing 15·98 per cent. sucrose in 1906–7 took 12·89 tons of cane to produce a ton of sugar, while in 1912–13 cane containing 14·09 per cent. sucrose only took 9·18 tons ; while the cane return

per acre planted was: 1906–7, 23·16 tons, and 1912–13, 30·6 tons.

The above figures are supplied by one estate, and, while they cannot be taken as representing the whole production, they are a fair indication of the general improvement, as most planters and estates have improved their methods both in mill work and cultivation.

The conditions under which the industry is working are in many ways better than in the past, but in others not so good. On one hand the planters have been deprived of the regular and reliable supply of indentured Indians from India, which was not only much cheaper but good. On the other hand, modern systems of work and improved results have placed the industry in a much stronger position; and while it was difficult to make more than a very moderate profit formerly, many of the better estates have recently made large profits, and from the point of view of labour the stoppage of indentured Indians has forced planters and others to utilise the native labour of the country much more than formerly, and, although wages are higher, it is proving satisfactory; and so long as we receive sympathetic treatment from Government, there does not appear to be any serious danger of cultivation being stopped for want of labour, as at prices which the industry can now afford to pay there should not be much difficulty in obtaining all the labour required, as, although the mines pay higher wages, the natives much prefer agricultural employment, which is above ground and not largely underground, as in the case of the mines.

There is a protective duty of 3*l.* 10*s.* per ton of 2,000 pounds on all sugar entering the Union from abroad, with the exception of the sugar grown in Portuguese East Africa, which is admitted into the Transvaal free of duty. This is the result of an old agreement made by the Transvaal Government with the Portuguese, by which, in exchange for the privilege of importing labour for the Transvaal mines, the Portuguese obtained the right of free entry of all local-grown products into the Transvaal. This agreement was subsequently renewed, and remains in existence for a further period of five years, but applies to the Transvaal Province only, and not to the rest of the Union or Rhodesia. In addition to the direct protection given by customs duty there is also an indirect protection through the railway, all Colonial produce being carried at lower rates than imported articles of the same kind over the railway system of the Union. These preferential rates also apply (in the Transvaal only) to Portuguese East African products.

The sugar interest has represented the unfairness of the introduction of a foreign bounty-fed sugar being allowed into the Union under the same privileges as the local-grown sugar, and has requested the Government to bring in legislation imposing a countervailing duty, but this the Government has not seen its way to do; and until the termination of the present agreement, there does not appear to be much chance of relief, as although the admission of this sugar is only allowed into the Transvaal State, and in the past has not had very much effect on the local-grown product, it will (as the production increases in Natal and in Portuguese East Africa) have an adverse influence on the sugar industry of Natal.

To sum up: The prospects of the industry in Natal may be regarded as good, and probably more promising than at any former period, as while there has been a very great increase in production, we are still unable to supply local requirements, the consumption being about 20 per cent. to 25 per cent. greater than the production; and while new mills are being erected and existing mills are increasing their output, there is but little prospect of our overtaking the consumption of the Union for some few years, as consumption is undoubtedly increasing, and the probability is that any advance in production will be counterbalanced by increased consumption.

Mr. Saunders remarked: I would just like to point out in regard to the paragraph of the paper you have just read which runs as follows: "It will be observed "that the figures of *Mill work* show that cane "containing 15·98 sucrose in 1906–7 took 12·89 tons "of cane to produce a ton of sugar, while in "1912–13 cane containing 14·09 sucrose only took "9·18 tons, while the cane return per acre planted "was, 1906–7, 23·16 tons, and 1912–13, 30·6 tons," that the class of sugar made during 1906–7 was not similar to that made in 1912–13. Had the two methods of work been identical, the difference in the figures, approximately speaking, would have been 2·89 instead of 3·71.

4988. **(Mr. Tatlow.)** The sugar industry seems to be in a promising condition?—Yes.

4989. Are you satisfied with the labour conditions?—The labour conditions are so far satisfactory that we can obtain what we require, and I think the labour will be procurable for any extension that is likely to take place.

4990. Is the production confined to a few large firms or is it distributed among a considerable number?—A considerable number. There are several large mills, and there is one firm which has four large mills, but in addition to that there is a fair number of small mills. But a great deal of the production of cane is done by small growers who supply the mills.

4991. **(Mr. Sinclair.)** You told us that the bulk of the cane is produced by small growers. Are those who grow the sugar coloured?—**(Mr. Saunders.)** No, the sugar is produced by small growers, who are almost invariably Europeans. In one or two instances they are Indians, but the labour they use is coloured.

4992. I want to see how far the labour can be done by the white worker, if it can be at all. You say the bulk of the labour is coloured?—Yes.

4993. Is that due to disinclination on the part of the white worker to do the work, or because he has not the staying power and cannot well do it?—I think it is largely due to both. The labourer in the sugar fields of the coastal districts has to work under very very stringent conditions for a European; that is to say, in the work of cultivation and in cutting. I think he could do it, but the conditions are not those which he would choose. Then another great objection to the white labourer from his point of view is working alongside the black man. That is more or less derogatory to him, and he would certainly not do it unless he was absolutely forced by stress of circumstances.

4994. In some Colonies it is suggested that the work in connection with the cultivation of sugar is not a white man's work; in other words, that he cannot do it without a deteriorating effect. Can you offer any opinion to the Commission on that question?—I should say, as far as our local conditions are concerned, that is quite right. I do not for a moment say that he cannot do the work. He can, because he does it already or similar work in vocations that are considered to be suitable. But you must remember that we have a large black population here. That population remains here, and naturally these people are looked upon as those who have to do the manual work, and the rough, unskilled labour. I do not think there is any physical reason why the white man could not do the work.

4995. Supposing that there were no coloured labour here, could the industry be carried on successfully, do you think, by white labour if it were available?—If the white labour were available, and the conditions were such that the protection were sufficient, I should say, yes.

4996. The protective aspect is outside our terms of reference. I am now speaking of physical fitness and capacity to do the work. Supposing there were a sufficient number here and no coloured labour, could the white worker do the work from a physical point of view?—I should say, yes.

4997. Without signs of deterioration appearing in his offspring?—Yes, because it has been tried in other parts of the world under conditions very similar to these which obtain here. Not that we have tried it here, but we must take account of what is done in other parts of the world. It is being done in Queensland and the conditions are similar.

4998. Apart from what is being done or is not being done in other Colonies, from your knowledge and experience you think that the white worker is physically capable of undertaking work of this nature, if it were necessary for him to do so?—Yes.

4999. **(Sir Jan Langerman.)** Do you mean to imply that the white worker could work in the cane fields and do the same work continuously for twelve months and compete with the coolie?—I consider that he is physically fit to do so.

5000. For a short period. But could he do it day after day?—It is extremely difficult for me to answer that question from personal experience, because, as I have already said, it has never been tried here. I can only suppose that given similar conditions he could do so.

5001. Could you work your mills with white labour profitably under present conditions?—No.

5002. The altered conditions would be in the direction of higher protection?—Yes.

5003. Now, what amount of sugar is being introduced from Delagoa Bay?—Those figures have been given you in detail.

5004. What percentage of the local production is it?—Last year it was about 8,000 tons out of a gross consumption of 120,000 tons.

5005. So 8,000 would not materially affect you to-day?—It does not affect the gross consumption, and as far as one can see, provided it remains at a sufficiently low quantity, it will be all right, but, of course, the danger of East Coast sugar from our point of view is first of all that we are increasing our own output, and if the products of the East African ports increase very considerably and they send a large quantity into South Africa, it must affect us.

5006. You know the character of the Portuguese. Do you think there is any likelihood that they will increase their supply?—Yes, it has nothing to do with the Portuguese; they are all European companies. I do not think there is a single Portuguese company in East Africa.

5007. How long have they been producing sugar in Portuguese territory?—I cannot tell you offhand, but I think about eighteen years.

5008. Would it be as long as the Natal sugar industry?—No.

5009. So that during eighteen years' work they have only been able to produce 8,000 tons per annum?—No. I should explain that Portuguese sugar is exported largely to Lisbon, where they get a rebate of half the Portuguese duty. So that when it started it was with the view of supplying the Portuguese market. They got an enormous concession by having half the duty allowed. But that amount is only up to a given quantity. The moment that is exceeded any surplus they have must find a market elsewhere. The first market they naturally look to is the Transvaal. In the event of not being able to consume it in the Transvaal, they have still to look out for other outside markets.

5010. So you have a fear that in the near future they may increase their exports to this country?—Yes, and we have not only a reasonable fear, but you may say that it is a certainty.

5011. As regards the future of the sugar industry, have you any fear at all that in the next twenty years the sugar will become so cheap that you will not be able to grow it at a profit?—I think I can better reply to your question in this way. We can afford to produce sugar here so long as we have the conditions of our local market, but at the present time the rate that we are paying and that we are likely to have to pay for our labour, makes it very questionable whether we can afford to produce that sugar and put it on the world's markets. I do not know whether that gives you a reply to your question.

5012. As long as you have control of your local market you will be satisfied, I understand?—Yes, we can go on indefinitely—that is, of course, supposing that present conditions exist. Supposing that the Government suddenly took it into its head to turn this into a free trade country then we should have to stop.

5013. You say that with new mills being erected, and existing mills modernised, output is increasing, yet there is little prospect of our overtaking consumption in the Union. Surely that should be the reverse?—No. That is to say, I am speaking now of the Natal Province; I am not dealing with East Africa at all. At present the production of Natal is roughly 100,000 tons, and the consumption of the Union is 120,000 tons, so that we have that difference to catch up before we overtake our own consumption. But during that time the consumption is increasing also.

5014. In spite of erecting new mills and enlarging the capacity of the existing mills?—Yes, except that I consider that for some time to come we shall have the benefit of our own market.

5015. **(Mr. Campbell.)** You said that, provided the present conditions continue, you can compete in the world's markets?—No, we cannot.

5016. When you refer to present conditions, you are referring to the price of labour, are you?—When I refer to present conditions I refer to the conditions of the country—our local conditions—that is to say, that we can produce at the prices which we are getting locally for our sugar by paying the price that we have to pay for labour, but the price that we get locally is largely controlled necessarily by the amount of Customs duty.

5017. Do you anticipate any rise in the demands of native labour?—Yes.

5018. Do you think they will ask for more wages?—They will.

5019. That will be a continually growing quantity?—Yes.

5020. With respect to that agreement with regard to Mozambique territory; has not the Transvaal ceased to take labour from Portuguese territory?—No, they get the bulk of their labour from there.

5021. Does that agreement last for a fixed term? Suppose that the Transvaal ceases to take Portuguese labour, would that agreement automatically cease?—No. The position is this. It was originally an agreement with the old Transvaal Government. It afterwards came under what was called the "*modus vivendi*" which was brought in under Lord Milner's régime; the agreement was subsequently extended for a further period of ten years—five of which have now elapsed, and a further five years have still to run. It does not cease automatically.

5022. Is it likely to be renewed?—That is a question impossible for me to answer. Naturally, the industries of the country will oppose it, but, on the other hand, the Transvaal wants the labour.

5023. Would it make a great deal of difference to your business if it were to cease?—Yes, it would make a great deal of difference to this Colony if that sugar were not allowed in free of duty.

5024. In regard to these tables of mill work, I see there has been a decline since 1906 and 1907 of the sucrose content in the cane from 15·98 to 14·09. What is the reason for that?—That is a matter which is controlled by the seasons and the climatic conditions. For instance, even in one year you may have a figure in one month of 16 and a drop down to 12 in another. The analytical tests at the present moment are higher than those figures.

5025. And during the time that the sucrose content has gone down your extraction of sugar in the mills has gone up, so that whereas in 1906 it took 12·89 tons of cane to make 1 ton of sugar, in 1912–13 it only took 9·18; that is due to the increased efficiency of the milling?—Yes.

5026. Now in respect to Javanese sugar, the figures are 8 tons of cane to 1 ton of sugar?—Yes, and in some cases less.

5027. Is that due to a higher sugar content or extra milling efficiency?—No. As a matter of fact, their content is even lower than ours, but their class of cane is totally different. Our season is biennial. It takes two years to grow a crop, and the cane here is of a nature much more difficult to get the sugar out of.

5028. You have certainly made a vast improvement in the efficiency of your milling: do you look for any

considerable increase in efficiency in the future?—Not a very great deal, because our figures compare very fairly with those of Java. Of course, it is impossible to take so many pounds of cane to so many pounds of sugar. That depends entirely on the amount of sugar content in the cane originally and the nature of the cane. But our figures compare very fairly with those of Java, taking into consideration the difference in the class of cane.

5029. Your climatic conditions prevent you growing the same class of cane as Java?—Yes.

5030. So you have no possibility of reducing that by introducing Javanese cane?—No. Suppose we took our cane from Java, the conditions under which that cane is grown in Java are different to here.

5031. You spoke of there being a protection given by railway rates: how much per ton does it amount to?—It varies according to the distance and the difficulty in arriving at what that amounts to is in regard to the centre from which it is calculated. Supposing you are sending 50 miles or 1,500 miles—there is such an enormous margin between the two. But as a matter of fact that protection by railways is not much felt. It is not of very great consequence, and the reason of that is this: that the price is so largely controlled by the price at which the article can be sold at the coast ports. So the benefit through that indirect protection does not amount to a great deal really.

5032. Is it appreciable?—Yes, for long distances, but for short distances practically nothing.

5033. Does Mauritius sugar compete here?—Yes.

5034. By reason of the fact that the Conference lines give special freights from Mauritius here?—**(Mr. Fowler.)** No, I do not think so.

5035. But they give special rates?—No. The bulk of Mauritius sugar that is imported is naturally imported *viâ* the Cape ports, and the rates of freight are not unfair compared with those from Durban to Cape ports.

5036. In sending your sugar round there, you use the Conference lines?—Yes.

5037. Have you any complaint to make in regard to treatment?—No.

5038. **(Mr. Tatlow.)** I see that in 1907-8 you produced 35,000 tons of sugar and imported 53,000 tons. In 1913 you produced 96,000 tons and imported 29,000 tons, a total of 125,000 tons, showing an increase between those periods of 47,000 tons, or more than 50 per cent. That was all consumed, I suppose, in the country?—Yes.

5039. To what do you attribute that large increase in the consumption of sugar?—I think it is largely due to the fact that the native population is more and more taking to the use of it.

5040. Do you expect that the increase will go on at the same rate?—No, it will be a decreasing increase.

5041. Will that be affected by higher wages which will, no doubt, operate in course of time?—Yes, the more spending power a man has, naturally the more he will go in for luxuries.

5042. And it will affect sugar?—Yes, to some extent.

5043. In regard to protection by means of the railway rate: are not all preferential rates being gradually discontinued? Is it not the policy of the Railway Administration under the Act of Union to discontinue them?—**(Mr. Saunders.)** I do not think so. They have not done so up to the present. They were really brought in in the early days, more in regard to grain, so that a man growing grain a long distance inland could get it to market at a very low rate. It enabled him to produce, whereas otherwise he could not. That was the origin very largely of these rates. They were applied at the time to all Colonial produce; whether he grew grain or sugar he had the same privilege, and that position remains to-day. If a man growing mealies, for instance, in the Transvaal, had to pay the ordinary rates he could never export grain. I do not think the principle will be abolished.

5044. You say they still exist to a considerable extent?—Yes, they do.

5045. **(Sir Alfred Bateman.)** You spoke of the sucrose as dependent on the season?—Yes.

5046. It is quite beyond human control?—Yes, it varies enormously from season to season.

5047. You receive sympathetic treatment from the Government, and you say that as long as that continues there does not appear to be any serious danger of cultivation being stopped for want of labour. Does that sympathetic treatment refer to duties or to the railway rates?—No, it refers to the labour supply. The whole position is this. In the past and at the present time, the mines were those who employed most of the labour available. The sugar industry was carried on almost entirely by Indian imported labour. Now that Indian imported labour has been done away with, and we are now dependent on those Indians who are in the country and any natives available either locally or within the borders of the Union or outside, and my remark there as to sympathetic treatment on the part of the Government was as to how far the Government might assist us in procuring that labour; because I should like to point out that the mine can afford to pay very much more than the agriculturist for its labour. But although we cannot pay anything like the same wages as the mines, we can offer a better class of work.

5048. You give healthier work at a lower rate?—Yes.

5049. You refer to foreign bounty-fed sugar; is that the Mozambique sugar?—Yes.

5050. Is it a direct bounty?—Mozambique sugar came under the Brussels Convention as a bounty-fed sugar for the reason that it was allowed into Portugal at half the rate of duty. The Portuguese duty is about 24*l.* a ton, and they received 50 per cent. on 6,000 tons. I think it is declared to be bounty-fed sugar to the extent of 8*l.* 15*s.* a ton, by the Brussels Convention.

5051. Is there a special class of sugar consumed by the Indian population?—No, I do not think so. I think you mean the native?

5052. No, the Indian population.—No.

5053. One knows what the Indian sugar is, as a rule; it is a different class?—It is a low grade sugar; but they prefer the other kind here, so long as it is not made by means of animal charcoal. The native is now asking for the best quality of white sugar.

5054. **(Mr. Campbell.)** In 1910, your exports to the United Kingdom were 2,593 tons of sugar. How is it that you were able to export sugar then?—That sugar was produced by two mills in the country, the machinery of which was only suitable to make 96 test sugar, that is, sugar that has to be refined before going into direct consumption. The available refining power was not sufficient to deal with the whole of the sugar produced by these mills. The consequence was that for that one year, while the needful machinery was being added to the refinery, there was more sugar of that class than the refinery could handle, and there was no sale for it locally, so it was exported.

5055. In regard to treacle; have you any difficulty about the treacle output?—It is either used for manufacture into rum, which is mostly sent Home, or used on the land.

5056. Is there no opening for making a commercial spirit?—Yes, a considerable amount is used for making spirits.

5057. You exported for 1913, 5,840 tons of treacle to the United Kingdom, and the same year you imported 7,147 tons of golden syrup. Does the treacle go to England for refining and then is returned here?—No, the treacle you see exported is what is termed "refined treacle," and that is sent to England. The imports of golden syrup is Lyle's golden syrup, which is used very largely on the mines by the natives, who make a kind of liquor with it. Lyle's golden syrup has been used for that purpose for many years, and most of what you see there imported is used for that purpose. The treacle

exported is treacle from refineries after extracting all the sugar they can get out of it.

5058. Could you not compete for that native trade?—Yes, we are doing so. We are increasing our production of it every year.

5059. There seems to have been a continuous rise in the import of golden syrup from 1910, with the exception of a slight fall in 1913?—Yes, the imports have risen, and also the quantity that is produced locally. It has been more than quadrupled.

Durban, Wednesday, 25th March 1914.

Mr. W. B. WILSON, Government Officer in the Tobacco Division of the Union Department of Agriculture, called and examined.

5060. **(Chairman.)** You have been good enough to give a memorandum on the subject of tobacco-growing in Natal. We will take it as read.

The Memorandum is as follows :—

TOBACCO.

I HAVE the honour to address you a few words on the tobacco industry of this country, and I shall speak with special reference to Natal.

First I will invite your attention to a few figures concerning the whole of the Union.

TOBACCO IMPORTS into and EXPORTS from SOUTH AFRICA in £'s (exclusive of Rhodesia).

	1911.	1912.	1913.
	£	£	£
Unmanufactured	50,078	39,574	50,358
Manufactured	5,636	5,585	5,968
Cigars	62,591	54,479	49,923
Cigarettes	70,048	76,414	84,656
	188,353	176,052	190,905
	EXPORTS.		
Unmanufactured	304	2,748	—
Manufactured	6,396	11,831	—
Cigars	2,179	2,187	—
Cigarettes	8,364	7,452	—
	17,243	24,218	30,385

	Rhodesia to S.A.		S.A. to Rhodesia.	
	1911.	1912.	1911.	1912.
	£	£	£	£
Unmanufactured	29,597	28,728	166	—
Manufactured	1,027	259	17,278	16,633
Cigars	15	9	1,095	792
Cigarettes	660	317	38,678	40,741
Total £	31,299	29,313	57,217	58,166

These figures show that last year South Africa imported more tobacco from oversea than any year since Union, which would indicate that there is still a market for an increased production of the proper class of tobacco, but we who are interested in the industry do not want to feel even that we are bound by that limit.

Unfortunately, we have no figures to show the exact production in Natal, but before Union the export was as follows :—

1904	1,129,359 lbs.
1905	1,993,813 ,,
1906	1,627,687 ,,
1907	1,401,251 ,,
1908	1,520,381 ,,
1909	—

Since Union there has been no record at all kept of the output of tobacco in this Colony, but in my opinion it will not this year exceed 2,000,000 lbs., and other men who are familiar with the agricultural movements of the Colony think with me that the production has not appreciably increased since 1905. The growing of it has been a neglected industry, but the manufacturers have done their best with what raw material they could get, and the quality of the cheroots and cigars has improved, but much more improvement is needed, and it must be in the class of tobacco offered the manufacturer.

We mean now to foster the industry and improve the quality of the raw leaf, and to increase the production. The reason for the production not increasing in the past and keeping pace with the times is not due to the fact *that the soil and climate are unfavourable to producing tobacco*, but that the work has been in the hands of Indians, who handle the tobacco in so rough and dirty a manner as to keep the quality much below the standard that the climate and soil are capable of producing.

The Indian, the way he is worked to-day, is the curse of the Natal tobacco industry.

With the work of the Tobacco and Cotton Division the production of tobacco in the Transvaal has increased from 2,891,450 lbs. in 1909 to 8,093,562 lbs. in 1911. The 1912 crop was not so large as the 1911, on account of the drought.

Travelling in Natal I have met only three Europeans who are growing tobacco, and I know of one or two others—by Europeans growing it, I mean giving it their personal attention. But at present I have now on my list the names of 20 men who want to take up tobacco-growing under Government officers' supervision and try to produce cigar tobacco, and some of them are going to produce it. This will mean an increase of general production, for other men are sure to take up what they see a few men push to succeed. Then a great deal of this tobacco would be good enough to export to the United Kingdom, and could be exported if they would offer a little encouragement

The United Kingdom imported last year (1912–13) 92,913,652 lbs. of tobacco.

Recently they have been encouraging the industry at home by allowing a rebate of one-third the Excise revenue on tobacco grown in England and Scotland, and by granting 6,000*l.* per annum to foster the industry in Ireland. The total production in the United Kingdom for 1912 and 1913 was 129,226 lbs.

If they would grant a similar thing of one-third the Customs duty to South African-grown cigar tobacco and South African cigars, I am sure that Natal could in one year's time send them some very good leaf.

The present duty on tobacco being shipped to England is 3*s.* 8½*d.* per lb., and on cigars 7*s.* per lb.

(Chairman.) In your memorandum you state the tobacco imports into South Africa in 1913 is 190,000*l.* What is the value of the local production in the whole of the Union?—It will be roughly 500,000*l.*

5061. So that South Africa produces about 75 per cent. of the total consumption?—Yes, about 60 or 75 per cent. of the total consumption.

5062. Then you give the figure of exports from South Africa as 30,000*l.* Where does that go to?—A good deal to the United Kingdom and some to the Continent, to various parts of Africa, and a small bit to Australia. But the largest part goes to the United Kingdom. The largest part is manufactured tobacco,

and is known in the United Kingdom as "Boer" tobacco.

5063. Is that used as it comes from South Africa or mixed with other tobaccos?—To a large extent at present it is used as it comes from this country.

5064. It is not used for mixing?—Not much.

5065. Now turning to Rhodesia: the Rhodesian figures of imports and exports in the Memorandum are outside those you have previously given?—Yes.

5066. I see there is a large exchange between South Africa and Rhodesia: Rhodesia sending approximately 30,000 pounds of tobacco into South Africa, and the Union sending 60,000 pounds to Rhodesia?—Yes; that is in round numbers.

5067. What is the reason of that exchange: is it a different quality produced in the two countries?—Largely a different class, and if you analyse it you will see the exchange is largely due to the raw leaf (unmanufactured tobacco) that comes from Rhodesia; is manufactured in the Union; and manufactured tobacco shipped to Rhodesia, as cigarettes and pipe tobacco. You will notice that I have not given the figures for 1913; those are not available as yet, and in my opinion they will not be as large on the side of South African tobacco exported to Rhodesia as in these previous years, because recently some factories have started in Rhodesia that are manufacturing to a larger extent Rhodesian tobacco. The export to Rhodesia is most largely cigarettes. There are very few cigarettes in this country manufactured from locally grown tobacco of the Turkish type. Some of that type has recently been grown in the Cape, and a few cigarettes manufactured, but nearly all the so-called Turkish cigarettes are imported into this country. And a large part of that importation to Rhodesia will be tobacco, cigars, and cigarettes that are imported into the Transvaal or other parts of the Union and re-exported to Rhodesia.

5068. Now, of the different portions of the Union of South Africa, which has the soil and climate best adapted to the production of tobacco?—Well, in order to give you an idea of that, I shall have to give you a few preliminary statements. There are several different classes of tobacco; there is tobacco suitable for the manufacture of cigars, cheroots, and cigarettes, which are again sub-divided into Turkish tobacco and tobacco of the Virginian type and that which is suitable for making pipe tobacco, and plugs. The production at the present time is, in the Transvaal, about three-quarters of the entire production of the Union; that is, nearly all pipe tobacco, and Virginian type, cigarette tobaccos. Now, in the Cape, there is a small production of the Turkish type of cigarette tobacco. In Natal, there is a small production of the cigar type, which is manufactured here into the so-called Natal cheroots or Natal cigars; but as to which one of the Provinces of the Union is best adapted for the growing of tobacco as a whole would require one with more experience than myself to say very definitely. Of course, one would assume from those figures that the Transvaal, which grows about 75 per cent. of the total production of the Union, was the part most suitable for the production of tobacco; but I have been through a great part of the Transvaal and a great part of Natal, and I am able to state that if Natal had the same amount of time and interest and energy and money expended on the production of good quality tobacco that the Transvaal has had, the production of Natal would, in my opinion, be in excess of what it is in the Transvaal at the present time. The soil and climate in this Province are, in my opinion, better suited for the production of tobacco of a good class, suitable for export or manufacture into cheroots, or mixing with American tobacco, than the Transvaal. As to the Orange Free State, they have never grown very much tobacco, and I have never been through that country, and so I cannot say. In regard to the Cape, they have grown some good tobacco, but I have never been through the country.

5069. If the soil, climate, and general conditions of Natal are so suitable for the production of good tobacco, why has the production gone back?—It has not progressed, but I do not think it has gone back either. It has fluctuated. If you have noticed my figures for Natal from 1904 to 1908, the largest figure of the lot is for the year 1905. Then there was not another one up to 1908 that was as low as 1904, but the 1909-10 figures are not given, owing to Natal coming into the Union, or some other reason, but from other sources we find that the value of the tobacco exported to the Transvaal is at this time 108,768*l*. That figure is not given on the statement prepared for you, but would show that it is about 1,500,000 lbs. judging from the usual price, which is 2½*d*. to 4*d*. per lb. This year, people who have travelled through the tobacco districts, and myself, are strongly of the opinion that the production is larger than it has been for the last number of years. But the main reason why the production of tobacco has not gone forward in this Province is because it is in the hands of coolies, and up to the present no Europeans have given their attention to it. The Department of Agriculture has not given it any attention or assistance.

5070. You say it is in the hands of Indian coolies: do they work it for their own account or for European owners?—For their own account, in some cases owning the land and in others paying rent and having full control of the crop, and in a very small percentage of cases growing for Europeans on a wage or percentage basis.

5071. Why have Europeans not taken it up more?—Because, in my opinion, the Indians started the industry at the beginning. They flooded the market with this cheap tobacco. There was a sale for it at such a price that the European could not make a living or make any money, and he could not compete with the Indian.

5072. How do you propose to remedy that state of affairs?—I propose to remedy that state of affairs by going among the Europeans and getting a number of them that are willing to grow tobacco on the right lines and by the proper methods; then they will be able to produce a much superior article to any that is grown in Natal, and something that will not really compete with what is grown by the Indians, but with the tobacco that is grown in the Transvaal or is imported into this country. Then, as this production increases, the Natal manufacturers will begin to use this leaf to the exclusion of the cheaper leaf.

5073. **(Mr. Campbell.)** Is there any excise duty on tobacco in South Africa?—On cigarettes only.

5074. So that you will have fairly heavy protection for the industry?—The Customs duty is 3*s*. a pound on the imported leaf and 6*s*. per pound on cigars.

5075. Is that not rather a heavier protection than in any other country where tobacco is grown?—No. In the United States, for instance, the protection is really larger than that. The protection varies according to the different classes of tobacco, but for the cigar tobacco, which the Department of Agriculture is really trying to establish the production of in Natal, it is one dollar and eighty-five cents per lb.; that would be about 7*s*.

5076. Does not the United States impose a considerable excise on locally-grown tobacco?—No, only on the manufactured.

5077. Provided that you could improve the quality of your tobacco, do you think you could compete in the world's markets?—In Natal, it is my opinion that they could, because they can grow tobacco here more cheaply than in the Transvaal. I have had experience in both places. Here they have a better rainfall; they do not have to irrigate the crop, whereas they have to do so in parts of the Transvaal. The Transvaal has tried it and could not compete at the prices offered, but I believe Natal can compete.

5078. What is the average production per acre of leaf here?—About 1,000 lbs. per acre.

5079. That is fairly high?—Yes, quite a good average.

5080. **(Mr. Tatlow.)** You stated that the Department of Agriculture was doing nothing to encourage the growth and cultivation of tobacco?—I mentioned

that in the Province of Natal up to the present year the Department of Agriculture has done nothing.

5081. What do you expect them to do?—I expect them to disseminate information among the farmers as to the proper methods of growing tobacco.

5082. Have they begun to do that now?—Yes.

5083. Is it at the instigation of the tobacco manufacturers that they have moved?—More at the instigation of the farmers, and to a certain extent at the instigation of the tobacco manufacturers. As an illustration of the fact that the manufacturers here are anxious that the tobacco shall be improved, one manufacturer has offered a prize of 10 guineas for the first 100 pounds of Natal-grown tobacco leaf of good uniform colour, suitable for wrapping cheroots. Another has offered 5*l.* for the best 1,000 lbs. of cigar tobacco grown in the Province by Europeans from imported seed.

5084. Can the tobacco manufacturers themselves not do a great deal to disseminate the needful knowledge?—Some of them are doing that. A good few have from time to time sent their men through the districts and they always explain to the growers why it is that they cannot give as much for this class of tobacco as they could if it were better, and they tell them how to improve it. Well, this improvement is not taking place as much as it might or could have, because it has been in the hands of the Indian coolies.

5085 How many factories are there at present in Natal?—In Natal there are six of some size and there are other smaller ones.

5086. Your exports are improving, though the amounts are not yet considerable. They have risen from 17,000*l.* in 1911 to 30,000*l.* in 1913. You do not give any figures before 1911?—No.

5087. Are the exports entirely of recent years?—Before 1910 it was all from the different Provinces, and it is entirely of recent years, I should say since 1908, because, if you will notice the statement as to tobacco grown in the Transvaal, up to 1908 it was only two million pounds. Ever since the war there have been a few parcels exported, but it has not been of any appreciable amount until about 1908. And then the first figures I give are 1911.

5088. Although it is not a big sum it is progressing?—Yes.

5089. Is it showing signs of increasing?—Yes; because the quality of tobacco is getting better, and the farmers are able to produce it more cheaply, as they learn how to apply better methods, and co-operative societies are coming into force in the big tobacco-growing districts.

5090. **(Mr. Sinclair.)** Then tobacco-growing in Natal, as a white man's industry, has scarcely commenced?—It began this year. It is the beginning now, and this year 1914-15, the Department of Agriculture has put on a tobacco man to look after the Province, and to instruct the growers how to produce a good quality of tobacco that can compete in the markets.

5091. That would seem to recognise that the field is a suitable one for growing the product?—All the manufacturers, the tobacco experts, and the Tobacco Division of the Union of South Africa, are strongly of opinion that Natal is a very favourable field for the production of good tobacco.

5092. I see in your statement that in travelling through Natal you only met three Europeans who were growing tobacco?—Yes.

5093. Does that represent all that is done by Europeans in the meantime?—Well, I would not like to say it is all, because I have not met all the men.

5094. Does it approximate to all?—That approximates to it very closely.

5095. In order to establish the industry, the first thing, I take it, is to get more Europeans to take up the growing of tobacco?—Yes, that is the first step.

5096. Will the work involved in growing that tobacco be done by European or by native labour?—It will be done by native labour—the actual manual part of the work.

5097. The work will be done by native labour under the direction or supervision of the European?—Yes, under direct supervision.

5098. Then what is to be added to the existing condition of things under which tobacco is grown by the native? The direction of the European?—Yes, the direction of the European.

5099. Do you look to the direction of the European as sufficient to inaugurate an industry that up to the present has not been able to make its way in Natal?—If the European will apply proper methods I have reason to believe that he will; I am of opinion that it will inaugurate itself.

5100. The tobacco that is grown at present in Natal is a coarse tobacco, is it not?—A very large part of it.

5101. Used largely, so I gather from a statement that has been put before the Commission, for the purpose of consumption by the Kaffir in the shape of snuff, is that so?—A large amount is used for consumption by the Kaffir and a certain amount for the manufacture of Natal cheroots, of which there is at present an output of about a million a month.

5102. And you think that when you get this industry set going it will be able to compete with tobacco grown in Rhodesia?—Yes.

5103. Under present conditions Natal seems to get the labour of manufacturing the raw material that is grown in Rhodesia?—Not Natal, but the Union of South Africa.

5104. Is that likely to continue? Will in time the manufacture not take place in Rhodesia?—As I stated before, the manufacture has in the last two years been started in Rhodesia, and is taking much larger proportions, but the amount of raw leaf that has been imported in the last two years from Rhodesia is not considerable.

5105. A good deal seems to depend on the future. You are really at the commencement of an experimental stage, so far as the growing of tobacco by Europeans is concerned?—Yes, so far as the growing of it by Europeans in Natal is concerned, we are just at the beginning of an experimental stage, but judging by the class of tobacco that is grown by the coolies with their primitive methods of handling it is very very strong—almost conclusive evidence—that under the direction of Europeans, and with the care that tobacco should have, it will be a very profitable industry here.

5106. **(Mr. Garnett.)** You say there are very large areas in Natal suitable for the growing of tobacco; what are they doing at present?—The most suitable areas at present are being cultivated by Indians.

5107. You say you want Europeans to take up tobacco?—Yes.

5108. And you say there is a very large area which could grow tobacco in the occupation of Europeans?—Yes.

5109. What are those areas growing to-day?—A good deal is growing nothing. Some of it is running stock, and a good deal is being held by people who have the money to hold it.

5110. What stock is it running?—A few cattle, mostly Kaffir farming. And a large part is growing mealies. Perhaps the larger part.

5111. You are very desirous of increasing your production and exporting mealies, are you not?—Yes.

5112. I only ask this question—I want to know whether it has yet been demonstrated to the occupier of the land that the tobacco which you wish them to grow is an economically better paying proposition than what they are engaged in to-day; I presume it all hangs on that?—Yes.

5113. The occupier of land will naturally grow the crop which he is convinced gives him the best return, is that so?—Yes.

5114. Has it been demonstrated as yet that tobacco is a good substitute for mealies?—Yes, where soil is suitable.

5115. Is tobacco a crop that, if grown under good conditions and at places favourable for production, will pay better than mealies?—I say yes.

5116. But you have not yet been able to convince the owner or occupier of the land that it is a better proposition?—In Natal, there has been no attempt to convince them of that until this present season, and I have now twenty men who have already said to me that they are willing to take up the growing of tobacco and give it their direct supervision. That is a very small start. But all things must have a beginning, and in the Transvaal it has been so demonstrated to them that the production from 1909 to 1911 nearly quadrupled itself.

5117. But I wanted for the moment to confine myself to Natal. It is only just now that efforts are being made to convince owners of the soil that tobacco is a payable proposition?—Yes.

5118. And you have not yet proceeded very far in that direction?—No, in Natal itself there have not yet been grown any crops by these men.

5119. Then at present it is entirely in the experimental stage?—Yes.

5120. And the results of this experiment will largely depend on the success or failure of these farmers who have taken the matter up?—Yes.

5121. At present, there is not sufficient evidence forthcoming to say with certainty that tobacco will be a more favourable substitute for the crops that are now being grown?—Well, to my mind there is.

5122. But you have not demonstrated it—you are in the process of demonstrating it?—Yes, we are in the process of demonstrating it to the Natal farmers.

5123. Of course, however great the desire may be to cultivate tobacco, unless it is proved beyond doubt to be a more remunerative crop than anything else the farmer can grow, it will have to stand down, won't it?—Yes, naturally.

5124. **(Mr. Bowring.)** Referring to your table of exports, before Union a certain quantity was exported from Natal; now was that exported into the other Provinces of the Union, or did it go oversea?—About 90 per cent.; well, I should say all of it, practically speaking, to other Provinces of the Union. A few pounds went to the Continent and different places here and there, but out of the total in the last year, 1907–08, roughly 1,000,000 lbs. went to the Transvaal itself.

5125. The greater part—in fact, practically all—of this export went to the other provinces of the Union?—Yes.

5126. And do you anticipate that under the new regulations and under European supervision you will grow tobacco for export beyond the Union, or is it only for consumption within the Union?—We will grow first for consumption in the Union, and then it is my opinion and hope that we will grow it for export beyond the Union.

5127. You think that the quality you will produce then will be suitable for manufacture in the United Kingdom and other European countries?—Yes, I do not expect to reach that quality in the first year, nor even the second, but in the next five or six years.

5128. It will be difficult, will it not, to change the quality of your tobacco, having regard to the coarse material that you are growing at the present time. That will have an effect on any new seed you bring in?—In the market it may to a great extent, and it will be to that extent simply because it is in the hands of the Indians. No doubt, if the quality of the tobacco that was being produced to-day was being produced by Europeans whom you could go to and teach and instruct how to produce a better quality, it could very readily be changed, but as it is now, we have to go on with the production of a better quality by Europeans that will gradually replace the poor quality that is being produced now by Indians.

5129. You do not advocate the destruction of the coarser qualities that are now being grown?—To a certain extent I do, and that would be an ideal condition if you could get the people to do it: That is, to take these tobacco farms where the coolies are growing tobacco and buy them up for the Europeans to give their personal supervision. Then the production of this inferior tobacco could be replaced by the production of a better grade.

5130. It would be done immediately, instead of having to do it gradually in the course of years?—Yes.

5131. **(Mr. Lorimer.)** I gather from your memorandum that you regard the soil and climate of Natal as being very suitable for growing good tobacco?—Yes.

5132. And that the industry has been prejudiced in the Province because of the growth of rank and inferior tobacco in small patches by Indians?—Yes.

5133. And that the pollen of these inferior plants of theirs is carried into areas where the better class of leaf is grown and so serves to deteriorate it; is that so?—It is true indiscriminate cross pollination of tobacco causes a deterioration in the progeny of the cross pollinated seed. The Indians have allowed this cross pollination in their fields until the tobacco has deteriorated, but these fields are not grown in close proximity to plantations of good tobacco.

5134. What class of tobacco is grown by the Indians?—The class of tobacco that is grown by the Indians varies. Some is better than others, some is fairly good, but there is nothing really superior.

5135. Are these cigars you have submitted of your own growth?—They are of Natal manufacture, from Natal-grown tobacco, with the exception of the cover leaf. And the cover leaf we hope to grow in Natal later on. Some of the Natal-grown tobacco is used as cover, but is not of as good quality as this.

5136. These, of course, are not made from the tobacco that is grown by the Indians on their own patches?—Yes, from the tobacco that is grown by the Indians on their patches.

5137. Then you mean to say that the whole of the tobacco grown in Natal now is of one quality?—No, not of one quality. Some is better than others, but none, *par excellence*, superior.

5138. You want to mend that state of things?—Yes.

5139. And your remedy is what?—To get the growth and cultivation of tobacco into the hands of Europeans who will give it proper attention.

5140. You have a large protective duty, have you not?—Not what you can call large. It is fairly large—3*s*. per lb.

5141. And the growth would be so many pence?—Yes.

5142. That seems to be a very respectable protection?—Yes.

5143. I suppose there is no excise duty?—No, except on manufactured cigarettes.

5144. Is that enough?—Just at present I should say it is. We are not advocating a larger Customs duty.

5145. You also suggest in your paper a preference, but as you are aware, that is outside our reference. We cannot consider it at all?—Yes. But if it could be given, Natal would very soon export larger quantities of tobacco to England.

5146. We would like to see that. Of course, if the quality were equal we would rather have it from here than any foreign country, but what I want to be at is if you have the soil and climate suitable, why you don't grow better tobacco?—We are going to.

5147. It struck me that you had developed in Rhodesia in a very striking manner, but I want to know why you have fallen behind?—Natal is behind the Transvaal and Rhodesia, because in Natal, during the past few years, the Department of Agriculture and the Europeans have not paid any attention to the cultivation of tobacco.

5148. You think you have had less attention than the other Provinces?—Very much less. There has only once, for a period of two years, been a tobacco expert in Natal who has given his whole attention to the production of tobacco, whereas Rhodesia for the last few years has had tobacco experts, and the Government has built warehouses and bought the tobacco that the planters grew, and paid them a fair

price, stored this tobacco until they could get their money, and, if necessary, dropped a little on it in order to build up the industry.

5149. That is, of course, outside the operation of the Union Government?—Yes. And in the Transvaal, prior to Union, the Government voted 10,000*l.* per annum for the building up of the tobacco industry, and they imported a number of tobacco experts who organised the tobacco division. Immediately afterwards the production jumped up from 2,000,000 to 3,000,000 and then to 8,000,000. Then, prior to that, nobody would have thought anything very great about the soil and climate of the Transvaal for growing tobacco, and nobody has in the past thought anything great of the Natal Province for growing tobacco, but just recently, since Union, they have come to find out that the Natal Province is possessed of a soil and climate that are very suitable for the growth of tobacco, and they have now organised the Natal Branch of the Tobacco and Cotton Division (Union Department of Agriculture).

5150. You now hope to obtain as much attention as the Transvaal has hitherto had?—Yes.

5151. Well, if you have the soil and climate, and can get sufficient help from the Agricultural Department, I suppose there is no reason why you should not very soon do exceedingly well?—I can see no reason at all why we should not soon produce as good tobacco in Natal as in any part of the Union.

5152. **(Sir Alfred Bateman.)** Has any of your tobacco been sold in England by any of the tobacco combines?—You mean the Imperial Tobacco Company of Great Britain and Ireland?

5153. I was told several years ago that it was difficult to get any new tobacco sold in England in the shops, because so many are tied shops?—Well, South African tobacco is sold. I am not sure whether it is sold by the Imperial Tobacco Company, but if it is not, it is quite likely that it very soon will be.

5154. I have been told more than once that the great thing is to get the thing sold by them, as soon as you can get a tobacco worth selling in England?—If you can get it sold by the combine, yes, in some respects it is a good thing, but in others a bad thing to get the manufacture of any class of tobacco in the hands of one combine.

5155. There is one other point. I do not know whether you have been home recently?—No, I have not, and I am, therefore, not very familiar with the latest developments of the retail tobacco trade on the other side.

5156. My point is in reference to the Imperial Institute. I believe they would be in a position to be of some service to you in regard to your tobacco industry. When you go to London, if you call at the Institute you will find they have there the productions of the various Colonies on exhibition, and there are the productions of the different South African Colonies among the rest of the Empire. Therefore, it would be well worth your while to see that any new specimens of tobacco which you grow here are sent home to be exhibited at the Imperial Institute in London?—Yes. I may mention that the Department of Agriculture is making up an exhibit, to be used for that purpose, at the present time.

5157. It is very desirable that the Imperial Institute should give a better idea of the new products of the different Colonies, including South Africa, and you say that the Department of Agriculture here is attending to that now?—Yes. I do not know whether it has already been shipped, but if not it will be shipped before very long. It will consist of tobacco as well as the other agricultural products of the Union.

5158. There is a great advantage in being thoroughly up to date in showing your wares at the Imperial Institute. It is a valuable advertisement?—Yes, naturally. It should be of considerable benefit.

Captain H. Noyes, called and examined.

5158A. **(Sir Alfred Bateman.)** You have been so good as to prepare a paper about the *Euphorbia Tirucalli*, with a view to showing that it is a very promising source of rubber in this country. This paper has been circulated and carefully read by the members of the Commission. I do not think it is necessary to ask you to read it out, but we will ask you a few questions.

The following is the memorandum referred to:—

Rubber.—The Euphorbia Tirucalli.

The *Euphorbia Tirucalli* grows in profusion in most of the valleys in Natal up to, and within, 40 or 50 miles from the sea. It exists in countless millions in the valleys of the Tugela, Umkomaas, Umgeni, and Umzimkulu rivers, and may be cultivated in the coastal belts of Natal and Zululand. It is found in its best development in the lower lands and adjacent to water; nevertheless, it will thrive where moisture is practically non-existent. It responds amazingly to culture and fertilization.

The latex from the tree contains percentages of rubber varying from 12 per cent. to 15 per cent., and an average of 74 per cent. of resin. According to Dr. Schidrowitz, the rubber, when extracted, is worth 80 per cent. of Para rubber. So far as my knowledge goes, the resin has not been produced on a marketable scale, and although a few tentative experiments have been made in regard to the suitability of this product for the manufacturing of varnishes, I have no authentic data to submit in this respect. I am informed, however, that a first-class varnish has been produced from this resin, and that, provided sufficient quantities were available, a large varnish industry could be inaugurated in Natal.

Under the name of "Almedina," the coagulum, without separation treatment, has been exported in quantity from Portuguese West Africa, and the product of a similar species of the Euphorbiaciæ, indigenous to Hawaii, is now being studied and treated in that island with a view to its exploitation on a large scale (*vide* "The Rubber World" Feb. 19th, 1914.)

Many other varieties of the Euphorbia family exist in Natal, but, so far, the *Tirucalli* has been the only variety it has been found practicable to work.

Commercial Possibilities.

The official returns of the Tirucalli Rubber Concession, Ltd., lately working the Tugela Valley Concessions, give as their return of crude coagulum produced up to 25th March 1913, 223,836 lbs. net weight, roughly 100 tons. I have no record of the output subsequent to that date.

The majority of this coagulum has been sold either privately or on the open market, at prices varying from 4½*d.* (when first produced) to 10*d.* per lb. In Germany there exists a notable demand for the produce, but, as in London, unless a settled supply is forthcoming, the users of the material are disinclined to quote a specific price.

Within the last few months, Dr. Schidrowitz—the well known authority on rubber—has been at work on a process designed to enhance the value of the product considerably. I am informed that his process is a success and that the value of the material will exceed 1*s.* per lb., but I have no definite knowledge of the details.

I am instructed, however, that either in its original or its altered form the product will have innumerable uses; such as for mixings; for use in insulation work; for pavements and flooring; for the manufacture of "chewing gum," and very many other purposes.

But there appears to be no doubt that, apart from the possibilities of the material in its crude form, scientific experiment will open up new fields of commerce in which the treated rubber may profitably be employed.

The Labour Question.

I am indebted to the Native Affairs authorities for permission to recruit labour free of the ordinary licence or fees throughout Natal. Notwithstanding, it has been found next to impossible to procure natives for the work without first advancing them several months' wages, in spite of the fact that in most cases my centres of work (camp) have been established in the neighbourhood of the natives' kraals.

During the initial stages of inaugurating the industry, it was found that the natives were prejudiced to some extent against the work: the reasons given being that recruiters engaging "boys" for the mines had informed them that the latex of the tree was highly injurious and would inevitably blind all those employed in the work. Those who have been prevailed upon to engage themselves, however, have quickly satisfied themselves that no injurious effects are to be feared from either tapping treatment or otherwise handling the product. It is regrettable, however, that the misrepresentation alluded to has gained a good deal of credence among the natives; and the first objection offered by a raw native is usually to the effect that white men have informed him that the latex will kill him.

In the Tugela Concession the average rate of wages, whilst the industry was under my personal control, amounted to 16*s.* per month per head, the majority of the hands employed being young boys whose ages ranged from 10 to 15 years. Good accommodation was afforded them, and no charge was made for tapping knives, cups, medicine, and occasional supplies of meat.

The work itself requires no exercise of strength and in two or three weeks the boys become sufficiently dexterous to be left, comparatively speaking, to themselves, or under the supervision of an induna. As a rule, in the hot weather season, an industrious boy could bring in his appointed quantum by two o'clock and employ the remainder of the day as he chose.

Alternatively he could continue working and be paid at the rate of 3*d.* per 5lbs. of extra latex brought in. To the best of my recollection no full-grown man ever worked overtime in this manner; those who did so being "umfaans," who were also the first to bring in their appointed weight.

Woman labour has been tried by me on several occasions and found to be utterly impracticable. Not that the work is difficult or arduous—as is the case with cultivating their fields—but because, from an employer's point of view, the women are unreliable and untrustworthy. Instances are innumerable where women have tapped for an hour or so and then walked miles to water in order to adulterate the latex.

On three occasions I have visited Durban and Maritzburg and conferred with some prominent Indians with a view to obtaining Tamil labour for the industry, having in the first place secured the concurrence of the authorities for the employment of Indian labour. Although I have guaranteed up to 3*l* per month to each Indian, with further payment by results—in the case of families—for each woman or child employed, I have not been successful in obtaining the services of a single Indian.

If procurable they would be infinitely preferable to Kafir or Zulu labour, as I know from personal experience in the far and middle East. Even if paid by results only, a single Indian could in the best tapping season—from October to April—obtain without difficulty his 30 lbs. of liquid latex per diem, and on this basis he could earn from 3*l.* to 4*l.* per month. Moreover, he could live in a climate suited to his tastes, and be employed in a manner to which he is by nature and training eminently fitted.

Working Costs.

On a Monthly Basis. One Man.

A native, after a few weeks' training, produces 15 lbs. of liquid latex per diem, equal to 8 lbs. solid coagulum or rubber; the cost of one native being, as a maximum, 35*s.* per mensem, inclusive of food.

Allowing for 25 working days per month, the output of one man will be 200 lbs. rubber, worth at 7½ per lb. (the price in last November, with Para at 1*s.* 1*d.*)—6*l.* 5*s.*

Estimating superintendence, transport, packing, treatment, freight and charges at 10*s.*, the resultant profit will be:—

Wages and food of one native	35*s.*
Other charges	10*s.*
	45*s.*
Value of one native's output	6*l.* 5*s.*
Profit balance	4*l.*

It should be noted, however, that small boys (umfaans) are more suitable to the work than grown natives, the pay of the former being approximately one half of the men's.

Suggestions.

As there exists in my mind no possible doubt that we have in Natal an unfortunately neglected but extremely promising industry of enormous possibilities and unlimited scope, I would suggest that representations to the proper quarters, drawing attention to the valuable natural asset we have near at hand, might have the following desired results:—

(*a*) The standardization of the product.

(*b*) The opening up of Continental and British markets.

(*c*) The encouragement of farmers and others to plant and cultivate the tree, if and where land unsuitable for other cultivation is available.

(*d*) The establishment of an experimental station on a small scale to determine the practicability of manufacturing varnishes, water-proof paints, and other articles, locally.

Or, alternatively, the appointment of a qualified official whose duty it would be to advise land-owners and prospective planters as to the proper method of cultivating, treatment, and other details connected with the industry.

(*e*) The establishment of a special rate as to railway freights until such time as the industry is on a proper footing.

5159. **(Sir Alfred Bateman.)** Of course, an important factor appears to be that there is an unlimited supply?—Quite. When I say unlimited I would, of course, like it to be understood that the young trees that are not in bearing should be allowed sufficient time to arrive at the bearing stage.

5160. Do you consider that it has been satisfactorily tried on a big scale?—Yes, undoubtedly so.

5161. Have you ever communicated with the Imperial Institute about this?—Yes, and Professor Dunstan has reported on it.

5162. Do you know whether his report is published in the Bulletin?—I do not know whether it was, but I had a special copy of the report sent to me.

5163. And no doubt he got information from the brokers as regards the commercial value of the rubber?—Yes.

5164. He would be sure to do that?—Yes, I think so, but in the case of a new rubber like this coming on the market it requires a certain amount of time before any manufacturer will take it up seriously, because, as a rule, he is not certain of a consistent supply, and what he requires more than anything else is the assurance that this consistent supply will be forthcoming.

5165. And that is the difficulty here?—Yes, that has been the difficulty so far.

5166. You want it taken up by commercial companies?—Yes.

5167. I suppose the people who are interested in these things are continually forming companies to exploit new articles of this sort?—Yes, they are forming companies, but I think that, as a rule, the matter stops there.

5168. It is not very easy to get money just now?—I do not think so.

5169. **(Mr. Lorimer.)** What is the difficulty of ensuring a regular supply? You began by stating that it grows in such profusion that you have countless millions in the valley of the Tugela. Is it the labour difficulty?—Labour has a great deal to do with it.

5170. Because you appear to have a very valuable product here and one of which some of the values are quite evident. I am interested in the possibility of making a first class varnish. Has anything been tried in that way yet? Yes, several people have made varnishes which have been submitted to me, but not knowing anything about varnishes I cannot say whether they were good or permanent or otherwise.

5171. What did the people who made it say?—They have quoted very good prices.

5172. And they would not offer more than it was worth, probably less?—Yes, but hitherto my course of action in this matter has been to produce the crude material and leave the development to others.

5173. Would the same people attempt to produce both rubber or rubber substitute and varnish, or would it have to pass through two different hands?—It would have to go through several processes and the resinous contents would have to be submitted to quite different groups of manufacturers.

5174. There would be two different sets of manufacturers who would have to deal with it?—Yes, quite. The varnish manufacturers and the people who use it for mixings and other purposes would constitute quite different classes of manufacturers.

5175. Well now, if the product of these trees was used for one purpose, would the residue be available for the other?—Yes, if it were used for its resinous contents only the rubber would be a by-product.

5176. If you were using it for making varnish?—Exactly.

5177. Then it seems as if you had in this article something well worth further attention, because, as you know well enough, both things bring good prices in the market?—Yes.

5178. Did these people who made the varnish for you give any indication of the quality through the prices? Did they indicate what would be the value of the varnish?—The price which they stated—of course, it was not an authoritative estimate, but it was given to me in good faith—the price of the varnish manufactured from this material would be in the neighbourhood of 8s. a gallon.

5179. That is the price of a very ordinary varnish, but it would no doubt be possible to subject it to fresh treatment and further refining?—Yes.

5180. What do you think we could do for you?—Well, my principal object in being here to-day is to draw public attention to the existence of this rubber-producing material in Natal.

5181. Well, we can take notice of it, of course. Are you hopeful of being able to overcome your difficulties in respect to labour?—Yes, I think so, because there is at the present moment in London a plant being established on the recommendation of Dr. Schidrowitz which he is confident will increase the value of the crude coagulum by 60 per cent.

5182. That is a plant which you would have the opportunity of keeping going constantly?—Exactly.

5183. And if you had regular steady orders, could you do that?—Up to a certain limit. I have been asked in London for hundreds of tons a month of this material. Well, of course, in the present state of the labour market, hundreds of tons a month is out of the question.

5184. Thousands of tons I think you said?—It would amount to thousands of tons in the year.

5185. Suppose somebody started a plant to manufacture this material of yours, would it be possible for you to keep that plant supplied upon a scale that you might determine with the people beforehand?—Yes.

5186. Suppose you were to say to these people I can give you 1,000 tons a year—by way of illustration—and that suited you, would it suit them or would 1,000 tons a year be too little to justify the erection of a plant for this purpose?—Do you mean from my point of view would it be too much, or from the point of view of the people who bought it?

5187. I mean from their point of view. What I want to get at is this: Is it worth while erecting a factory for the purpose of utilising this product to the extent to which you could supply it?—I think it is quite worth while.

5188. And have you persuaded anybody to adopt that opinion?—No, I have not, because I have been waiting to see if this process is an unqualified success. I am now unofficially informed that the process is a success.

5189. And you are now in a position to put your capacity forward to these people and say, I can do so-and-so if you will enter into a contract with me?—Well, with a certain amount of organisation I could do so; it would be very difficult to promise large quantities at present.

5190. But that brings it back to the point we started from. Can you guarantee any manufacturer a sufficient quantity of this material to justify him in erecting a factory on a limited scale?—On a limited scale, certainly.

5191. The limited scale, of course, would have to be a scale large enough to make it worth his while spending the necessary money in the erection of the factory, and you know better than I do, no doubt, what is the minimum that would be really useful and profitable. Could you keep that going?—Yes. We have had contracts for 10 tons a month, which we have kept people supplied with.

5192. But no one is going to erect a factory to handle only 10 tons a month?—Not on a big scale.

5193. But when it comes to hundreds of tons a month the question resolves itself purely into a matter of labour?—Yes; the supply is there waiting to be extracted.

5194. What interests me is this, whether it is possible for you to so arrange your output as to keep in working order the smallest factory which would be economically possible?—My answer is yes.

5195. Then you are now in a position to go forward to the people with whom you have been negotiating and say, "I can start you and keep you going to this extent"?—Yes, provided the order is not too large, and provided our labour is properly organised and available.

5196. Of course, you have the extent of the order in your own hands. You can easily say to anybody, I can give you no more than that, but you cannot expect anybody to enter into a contract with you unless you were able to say, I will give you this minimum quantity—whatever it is; you cannot put any qualification on it and say, "If I can find sufficient "coloured labour to do the work I will be able to do "so-and-so, and if not, not"?—No; but with a small contract like the one we had I could find the available labour.

5197. Is this material one that could be worked in conjunction with, or rather alongside of, other forms of rubber? Could it be made an adjunct to the business of an existing company, or would they require to erect a special plant to deal with it apart from anything else they have at the moment?—I am told that they would require a special plant if they used the material as it is. But it has been used for mixtures with pure Para, Ceara, and Castilloa rubber; it has been used as a mixture for manufactures which do not require such purity as is usually insisted upon.

5198. I should imagine that your plan would be to get it in the hands of the manufacturers and let

them find out what they can do with it. It will involve a good deal of experimental work on their own account, no doubt, to find out if it is necessary to build a factory for the exclusive manufacture of this material, but if it can be worked with something else I have no doubt that many people would try it?—Over 120 tons have gone home from Natal, and I believe the majority of it has been sold at very favourable prices, although the figures have not been given me, but evidently there was a demand for the stuff or it would not have been sold.

5199. Well, at any rate, we will be glad to do what we can for you by making the thing more widely known?—Thank you.

5200. And I shall watch with interest what you do about the varnish. I should like to know something more about it?—Yes.

5201. **(Mr. Bowring.)** Have you been able to overcome the native prejudice against working with this material?—Yes, it is only a matter of a few weeks, when they thoroughly understand that it is not harmful in any way.

5202. But the prejudice, I suppose, is still there?—Yes, among those who have not worked in it.

5203. So you have probably no difficulty at the present time in obtaining the labour you require?—We have had no difficulty in getting sufficient labour for experimental work, but when it came to producing on a large scale the want of labour was a very serious difficulty.

5204. From the prejudice, do you mean?—No, I do not think so. Of course, these concessions are mostly situated in the native locations, and the Kaffir will tell you, as a rule, that when he goes to a location he goes to rest and not to work. You can overcome that prejudice to a great extent as I have overcome it, but still it is there. He thinks he is rather hardly treated if he is asked to work when he comes home for a six months' rest.

5205. You mean when he comes home from the mines?—Yes, practically.

5206. It would seem that the labour required is more suitable to the boys than to grown-up people?—Yes.

5207. And those do not go away so very much from their places, do they?—No, they do not go to the mines; but there is a great demand for them as house-boys in Durban and Pietermaritzburg and other large centres.

5208. They go into the towns and enter domestic service?—Yes.

5209. And the women you find unsuitable altogether?—Yes, the women are unsuitable.

5210. **(Mr. Garnett.)** Would you be so kind as to describe as shortly and succinctly as you can the process to which this material is subjected?—Yes, certainly. The methods of tapping employed are practically the same as I have used in Para and Ceara cultivation. The treatment is practically the same. The question of tapping knives and the correct way of tapping the tree must be considered with a view to the greatest output with the least sacrifice of cortex or bark. The tree is tapped by making an incision with the knife, and the milky latex is caught in cups and coagulated by several methods. Acetic acid and tannic acid are usually employed, and afterwards it is coagulated and becomes hard. It is then treated by heat and pressed in moulds, covered with sacking, and is then sent home to the manufacturer. That is the whole process.

5211. Would you be so good as to tell me what is the vernacular or local name of the Euphorbia?—The native name is Umsululu. That is the variety which we exploit. Of course, there are others.

5212. I was recently in the neighbourhood of Tulumus River, near East London, visiting a farm, and there I saw quite a number of trees bearing a name which was known locally as the Nowboom as near as I could pronounce it. I was informed that this tree exuded a juice which people were very hopeful of being able to make into rubber. This tree was growing in countless numbers, and I was informed that people had already scientifically investigated its possibilities as a substitute for rubber or a probable source of producing rubber?—That is the *Euphorbia Candelabra*. I have been asked to go and advise on it, but I have not had the time. I am aware that people are experimenting with the tree. We have it here also in lesser numbers.

5213. At any rate, in this district the other tree is the more favourable?—Yes, it is better in every way. The tree grows quite close to Durban.

5214. Have Dr. Schidrowitz's experiments proceeded beyond the laboratory stage, as far as you know?—I am told, but quite unofficially, that his process has turned out to be a success, but he has not written to me to tell me so himself.

5215. You are not in a position to say what quantity he has experimented upon or has produced, whether it is a laboratory production or a production on a commercial scale?—No, I cannot say that. I have seen the product he has produced, but I cannot say whether he has produced it on a large scale since I left London.

5216. Of course, before the manufacturers can be induced to place large orders for this material, they would naturally wish not only to be assured of a supply, but also that the production on a big commercial scale would attain the same purity as the laboratory test. But you are not in a position to say as to that?—No.

5217. **(Sir Alfred Bateman.)** Besides the rubber tree that Mr. Garnett has referred to, there is also, I understand, the Landolphia growing to some extent?—Yes, there is the Landolphia in Zululand.

5218. From that variety you get quite a good class of rubber, do you not?—Yes, it compares very favourably with Para rubber, the difference is that with Para at 2*s*., Landolphia Kerkii, which is the Zululand variety, principally, would fetch about 1*s*. 8*d*.

5219. That does not grow here, does it?—No, only in Zululand, and the amount is limited. It also grows in swamps and places where collection is extremely difficult.

Mr. Julius L. Wides, Tobacco Manufacturer, called and examined.

5219A. **(Sir Alfred Bateman.)** You have prepared a paper which has been circulated among the members of the Commission, so I will not ask you to read it.

The following is the paper prepared by the witness:—

Tobacco.

The climate of the coastal districts of Natal is admirably suited to the cultivation of tobacco, and I have no doubt that, under better trade conditions, a quality equal to the best now known could be produced here instead of the poor rough leaf at present representing this article.

This indifferent quality (in comparison with tobacco grown elsewhere) is due to the fact that the cultivation of tobacco in Natal is now almost entirely in the hands of Indians, who, in order to handle the returns for their work as quickly as possible, in many cases cut their leaves before they are properly matured, and then cure them hastily and carelessly. The natural result of this is that when the article is put on the market it is not of the quality which it should be, and cannot compete with other tobaccos—even South African grown.

Our tobacco is too coarse, and the foregoing is one of the reasons for this failing.

It is practically impossible for a white man to compete with the innumerable Indian growers on a small scale.

Their joint crops are such a large percentage of the total that it practically forms the basis of market quotations, and, therefore, as production costs the white more than it does the Indian, owing to their

different modes of living, he (the white) makes little or no net profit, whereas the Indian may do quite well.

Years ago the quality of tobacco produced on the coast was much better than it now is, as then whites were the only growers, and, prices ranging from 1*s.* per pound upwards, they could afford to put more labour and care into their crops, and even experiment with Havana and other first-class seed, although this latter was not successful owing to the poorer quality tobacco having been grown to such an extent that the later experiments were spoiled by the plants being impregnated with the pollen from the more plentiful surrounding common plants.

At the present time Rhodesia is producing tobacco which finds a ready market in Africa and overseas at much better prices than local or Transvaal tobaccos can command, and, although they only grow about one-tenth of what we do, yet their returns equal those for the whole crop of Natal. This is the result of commencing with well-selected seed, and of careful handling of the plant, and the same results could be obtained in this climate under different conditions than those now ruling.

The Rhodesian grower has no unfair competition, and he also is not pressed to make forced sales, owing to the fact that the Government has taken a keen interest in this industry, and nursed it to such an extent that the farmer can obtain an advance of 75 per cent. of the estimated value of his growing crop, and, moreover, his crop is cured, sorted, and stored for him for quite nine months to mature. It is then sold, and any difference between the amount advanced and the total realised is paid over to him, less a small percentage for interest, handling, and storage.

Now Natal has also to compete in the Transvaal market with Mozambique, and, so far as Kafir is concerned, the consumer seems to prefer the imported article from our Portuguese neighbour, who can produce at even lower expense than our local Indians.

The Cape and Transvaal have great futures for pipe and cigarette tobaccos, but Natal tobacco is much more suitable for snuff, cigars, and cheroots, and could be improved to such an extent that a large export trade in the near future would be most probable.

What we want to improve the quality of tobacco is an export trade to sister Colonies and to Great Britain, under a preferential tariff.

This, I suggest, would give an incentive to the Natal growers to produce something that would be acceptable to the oversea consumer, instead of growing coarse leaf almost solely for the Kafir consumer of snuff—a small percentage only of the better leaf being used in the manufacture of cigars and cheroots.

With regard to the problem now touching the manufacturer, I may say that I have been closely allied to this trade since 1896, and find that the difficulties to contend against are more now than ever before in this Colony.

The cigar and cheroot industry is comparatively new.

Until 1896 Kafir cigars principally were manufactured in the Transvaal, owing to the heavy duty on Natal cigars going across the border—even raw tobacco from Natal was 6*d.* a pound duty till 15th April 1899.

These cigars were then made by Europeans, and were wholesaled at 7*s.* 6*d.* per 100, the cigar-maker earning 3*s.* to 4*s.* per 100, and the manufacturers were all Europeans. Since the alterations in the Transvaal duty tariff, this line is now sold at 2*s.* per 100, and the cigar-maker gets 1*s.* per 100, at which figure no European can earn a livelihood, and no European manufacturer can exist in this industry.

The conditions at present ruling in Natal cigar and cheroot manufactures are practically similar to the foregoing, there being so many young Indians who make this staple, and have ousted the older Indians.

That such a state of affairs does exist is entirely the fault of the Government, which has neither fostered nor protected this branch of industry, which is fast becoming a dead letter so far as the white man is concerned.

There has never been any protective legislation, nor, indeed, any notice taken of the many disabilities under which this trade has laboured so many years, and the number of firms who have "gone under" is considerable.

One cannot blame the man who works so cheaply (be he black or white) that he can cut the prices down to the finest point, and thereby oust his competitors from the trade.

Number one is the only person he has to consider.

It is significant that, at the present time, I do not think there are half-a-dozen European cigar-makers in the whole of the Union working at their trade, nor can a manufacturer afford to employ them owing to the afore-mentioned unfair competition. I personally have brought the subject many times within recent years before the proper authorities, but entirely without success, and matters are now so bad that the trade is almost in a state of collapse.

The effect must be even felt by "the great guns" of this industry, and the remedy, if remedy there is to be, must soon be found, or a very promising source of revenue to the Colony will be lost.

I do not consider that a granting of a monopoly would mend matters, but I know that in other tobacco-growing countries where "the powers that be" take an interest in the industry, the workman can make a comfortable living, the manufacturer has a fair return for his expended capital and energy, and the Government profits by levying protective taxes.

There is a source of considerable revenue to the Government here being completely ignored and overlooked; besides, if the industry was on such a sound footing as to be able to supply the requirements of the Union in this staple, what thousands of pounds could remain here that now go overseas to the several countries supplying the demand for "smokes." Again, there is no reason why Natal tobacco and cigars should not successfully enter into competition with those of other countries, and so provide another article to mention in the export list.

Even under present conditions, if cigars manufactured in bond partly from imported leaf (on which 3*s.* per pound duty has to be paid) were subject to a rebate of a like amount, a good export trade could be done, and a fillip given to this and other industries.

It is necessary that Government fosters this and other declining industries in order not only to secure revenue from exports, but also to encourage the influx of white population, which is always a source of revenue to an industrial country; and with suitable legislation, I have no doubt that scope could be made for the more rapid progress of the white races in the entire Union.

At present our industrial concerns do not even provide work for the rising generation.

In conclusion, I sincerely trust that the results of this Commission will prove of great value both to this Union and other portions of the British Empire.

5220. **(Sir Alfred Bateman.)** You say that as far as the native trade is concerned, consumers much prefer the imported article from Portuguese territory to that produced by the local Indians? Is there a duty on tobacco from Portuguese territory?—No.

5221. Under a special arrangement it comes in free?—Yes.

5222. And you suggest that you want a preferential tariff from the sister Colonies and Great Britain?—Yes.

5223. You are mainly in agreement with the evidence which we had this morning from Mr. Wilson?—Yes.

5224. You complain that the support of the Government has not fostered or protected this branch of industry, which is fast becoming a dead letter as far as the white man is concerned?—It should have been more protected than it is at present. For instance, to-day, tobacco is just like cabbage in this country.

In other countries you find tobacco is quite different to what it is here.

5225. But you have a protective duty?—Yes, from other parts, but that is not sufficient.

5226. You want protection against the other Provinces in the Union?—No, not exactly. It should be as at present in that respect. But no licence has been necessary up to the present in the tobacco trade, or even manufacturing, and, in fact, the natives are entirely spoiling the whole business.

5227. Do you want a licence for people to produce tobacco?—No, not exactly in producing it, but in selling and manufacturing an article like snuff, for instance. To-day, snuff is quite an item in this country, and it is made mostly by natives who hawk it about.

5228. Then you rather want protection against the natives?—Well, it should be, in a way, like other merchandise. You do not find in other countries that it can be hawked about without a licence.

5229. What other line is there which is licensed?—Everything is licensed here except vegetables. No line is sold to-day without a licence except vegetables, and tobacco to-day in this country is just like vegetables.

5230. There is no licence for the sale of snuff and tobacco?—No. And then there is another point. The manufacturers would have their name on every manufactured line, like cigars.

5231. **(Mr. Garnett.)** I do not quite understand why you think this licence would be any advantage to your industry. I should like to understand it?—If an article is simply thrown on the market it brings down the price. Tobacco should be different to vegetables. To-day it is just like cabbage. For instance, tobacco may be one shilling a pound towards the end of the season; when everybody throws it on the market it makes the price go down to 1½*d.* lb. That kills anyone in the industry.

5232. I see, what you want is to try and prevent a glut on the market—a great quantity being thrown on the market all at once?—Yes, there are hundreds of people throwing the article on the market at once, and that ruins the trade.

5233. You want to restrict competition?—It is not exactly competition, but tobacco should be different to other forms of produce. It should be controlled in the same way as in Rhodesia. In that country the tobacco producer does not throw his produce on the market in this way. He gets his price immediately the article is produced, but it is not forced on to the market, and the result is that the article is always of a standard quality, it keeps up the price, and everybody who is interested in it gets a benefit. Rhodesia is only producing about one-tenth of the quantity that Natal produces, but still the returns are nearly as large as Natal. The farmer is not so pressed there, because he can deliver his tobacco to the Government, which helps the industry, and he is not forced to throw it on to the market as he is here.

5234. Then you want an arrangement made whereby the tobacco is financed until it is ready to be put on the market at the proper time?—Yes. We get a bad name for the tobacco, because it is not assorted, and it is not the same quality every time, and we get a lot of disputes in consequence. The first quality may be "A" and the next "C," and so on.*

5235. **(Mr. Sinclair.)** Apart from the question of protection, which we are not allowed to consider, what form of Government help do you want in order to foster the tobacco-growing industry in Natal?—Well, it would be rather hard for the Government to only put on a small duty.

5236. Leave the question of duty on one side. We cannot go into it. Apart from duties, what form of Government help do you suggest to assist the grower in Natal?—First, there should be a better class of tobacco seed planted; secondly, no green cabbage should be placed on the market; tobacco should be stocked for a certain time by Government officials, and be well matured before it is ready for the market.

5237. Your first suggestion is that the Government should help the grower by education, and by instructing him as to what kind of seed he should grow in order to produce the best quality of tobacco?—Quite so.

5238. Is there no such instruction given by the Government in Natal at the present time?—No, there was not up till quite recently that I know of.

5239. Is there now?—I have seen an article about a fortnight or three weeks ago, written by a tobacco expert, but I do not know if it is in force.

5240. What you want is systematic instruction given by the State in the interests of the tobacco grower?—Yes.

5241. Have representations been made by your local Chamber of Commerce to the Government, or have representations been made to the Government direct?—There is not 2½ per cent. of European producers in the tobacco industry at present. I have written a few times myself on the subject of tobacco, and have pointed out where the present difficulties could be mended, but no notice was taken.

5242. Having in mind the small number of Europeans who grow tobacco in Natal to-day, do you think that if Government help was given in the shape of instruction, a large number would take to the growing?—Europeans certainly, because there used to be in former days more Europeans than Indians.

5243. And the labour that would be employed by the European growers, would that be white labour or native labour?—Mostly coloured labour.

5244. And your other point was that there should be some financial help given so as to store up the tobacco, and not flood the market?—Yes.

5245. Will the local merchants who take the supplies not do anything in that direction?—There used to be some merchants who took a great interest in the industry, and tried to help it as far as they could, but I am sorry to say it was all failure.

5246. Have the merchants who nursed it given it up altogether then now?—They have failed.

5247. Whatever interest they took, it was a failure?—Yes.

5248. And there is nothing for it now, you think, but for the Government itself to come forward and take an interest in the expansion of the industry?—That is what I think.

5249. **(Mr. Tatlow.)** What is the chief difficulty in producing a good tobacco? You spoke rather despondently of the industry, and you said that the quality of a good deal of the tobacco was like cabbage leaves. Is that due entirely to the grower of the leaf?—Yes, as well as not maturing it. After cutting the tobacco there is a way of maturing it. But the way they do to-day in many cases is to make beds in their huts out of the tobacco leaves. It may be quite strange to you, but so it is. Ninety per cent. of the leaf to-day is prepared in that way, and the tobacco gets a different quality according to how it is stored. A great deal is of a coarse kind, and it has an unpleasant smell. While you are here I have no doubt you will see the tobacco, and see how it compares with the produce of other parts of the Union.

5250. What is it that appears to you as absolutely necessary in order to produce a better tobacco? What is essential?—A different way of handling, and to give it time to properly mature. To-day the tobacco is taken off in Natal within six weeks or two months. It is taken off from the stalks and placed into heaps, whereas other plants take as much as eight months.

5251. Do you mean instruction by the Government is necessary?—Well, it should be through the Government, because no individual farmer can take any interest if no one suggested such a thing. As the industry stands to-day, the farmer must immediately have his return, *i.e.*, must sell at once.

5252. Why should not the manufacturer do all this? Is it not worth his while to go to some expense and trouble in this matter?—Well, it would be, but

* *Note by witness:*—

A quality	-	-	24 to 30 inches.
B "	-	-	20 " 24 "
C "	-	-	16 " 20 "
D "	-	-	12 " 16 "

when it comes to big quantities it is another matter. They have done something in this direction in the past, but it has been unsuccessful. It may be all right for one year, but when they have gone from one year to another and find it has turned out a bad speculation, they have given it up.

5253. Do you represent the manufacturers? For whom do you speak?—For the Chamber of Commerce and one of the manufacturers.

5254. How does that matter of selling without a licence affect the quality? That, surely, cannot have any serious effect on the quality of the tobacco sold?—Well, it is only treated as cabbage. You will find that tobacco is sold on the Natal market at 1¼*d.* per lb. It is a sacrifice.

5255. Whether it is sold by licence or not, they can only sell what the manufacturer produces?—Yes, but if it were differently organised, everybody would be induced to take up tobacco on different lines and a different quality would be produced. But to-day there is no encouragement to go in for a better quality.

5256. What opinion have you in regard to the question of growing tobacco? Should there be some Government control over it? Should there be some grading of the leaf before it goes to the manufacturer?—Grading should be the principal thing, certainly.

5257. Is that a matter which has been brought before the Government?—I have put it to them in different ways, and about three years ago I saw Mr. Marshall Campbell, who is the representative in Parliament for Victoria County. I had an interview with him, and urged him to do something to bring the matter before the Government, but nothing has been done until the present time.

5258. How many manufacturers of tobacco have you?—About ten here to my knowledge.

5259. Have you any manufacturers' association?—No.

5260. Would it not be desirable to combine and see what could be done by combined action to bring about an improvement in the present condition of the tobacco industry in Natal, and endeavour to get the Government to help the industry in the ways you have suggested?—There were so many Indians in the trade. I suppose that was the reason why there has been no combination.

Pietermaritzburg, Friday, 27th March 1914.

Mr. J. MARWICK, Vice-President; Mr. S. B. WOOLLATT, Member, Executive Committee; Rev. JAMES SCOTT, Member, Executive Committee; Mr. DUNCAN MACINTYRE EADIE, Secretary, of the Natal Agricultural Union, called and examined.

(*For the evidence of these witnesses on "Land Settlement" see page* 41.)

5261. **(Sir Alfred Bateman.)** You have come to give us information about various subjects connected with agriculture in this Province?—**(Mr. Marwick.)** Yes.

5262. **(To Mr. Scott.)** I understand that you have to leave soon, and would wish to be examined first. Have you anything to tell us as to the growth of mealies?—I have been studying agriculture in general in Natal for the last fifty years, and I am not satisfied that this country will ever be a very large exporter of maize, because some parts of the country do not get rain enough, and generally there is a failure in one part or another. For instance, we hear there is no crop at all in the Orange Free State, and therefore a great deal of the Natal crops, which are very promising, will be required in that part of the country. We will have to send a great deal to Johannesburg. But we cannot be certain of that at present; there may be heavy crops in other districts beyond Johannesburg, but I certainly do not believe that the export of mealies is to be one of our large industries.

5263. I think your rate was reduced to 10*s.* a ton when we met last?—Yes, but we had some exceptionally good years and sent considerable quantities before that. The rate was reduced to the lower figure, which had the effect of giving a considerable impetus to the exports of mealies, but I do not believe that South Africa will ever be a very large exporter of that particular kind of produce. I have a great deal more faith in wool, wattle bark, and some of the other industries.

5264. What other industries?—Well, I hope that the dairy and cattle industry is going forward. We have now got rid of a good many of our diseases, with the help of scientific men like Dr. Hutcheons, Sir A. Theiler, and Colonel Watkins Pitchford. We have overcome a good many of the most serious diseases which have been the bane of South Africa for the last fifty years. Sir Rider Haggard will remember what lung sickness was in the early years in Natal—what a curse it was in the country for forty years. We could not keep a herd of cattle without having it swept off. Then came rinderpest, foot and mouth disease, redwater, or East Coast fever, and I think we may safely say that we have now beaten all these, and unless we get some new disease, I think we have not much to fear on this score. There is only one serious one that I know of, and that is sura. We have not had it yet, but we nearly got it in South Africa, owing to the importation of camels, but through Dr. Theiler's knowledge it was stopped just in time.

5265. When was that?—Some few years ago. Some camels were brought into the country.

5266. **(Sir Rider Haggard.)** What are the symptoms?—I do not know.

5267. **(Mr. Campbell.)** It belongs to Northern Africa, does it not, and affects camels?—Yes, Egypt and Arabia. **(Mr. Woollatt.)** And India also. **(Mr. Scott.)** It affects all domestic animals almost, but we think we have now got the mastery of all these other diseases.

5268. **(Sir Alfred Bateman.)** Have you anything to say about the things you want remedying that affect agriculture in Natal?—I think the evils are mostly in our own hands to put right, by putting a little more hard work into the country.

5269. Labour, is that satisfactory?—It is not generally thought to be satisfactory. But it is improving—I think the native is improving as a worker. I think the difference between now and fifty years ago is very very great. I have been among the natives a good deal. I have been for thirty years a missionary among them, and I think there is a great improvement in their labour to-day, but it is not satisfactory. As compared with Indian labour, for instance, the latter is far more efficient. I believe that necessity will drive the native to be a better labourer, and although the nominal sum which I heard Mr. Angus mention may appear to be small, yet the labour is like all other low-priced labour, it is not very cheap in the long run. There is not a great deal done for the money, small though it is.

5270. It wants superintending?—It needs close superintending.

5271. **(Sir Rider Haggard.)** Is there a sufficient supply of this labour, if it is well treated?—It all depends on the price you expect to pay. I think there is a considerable reserve not yet brought into use, but it will gradually be brought into use. Of course, if we could get Indian coolies in Natal at the low rates

that have been paid in the past, the Indian would oust the native altogether from many employments. On the sugar and wattle plantations he is very much more skilful in the use of his hands.

5272. The ordinary native is getting 3*s.* a day at the mines, is he not?—I am not sure now. A couple of years ago I saw them earning 5*s.* a day at piecework.

5273. And here, it seems, he is paid 1*s.*?—Yes, 20*s.* to 30*s.* a month is very common.

5274. It is no wonder under those circumstances that labour is sometimes short?—No. Of course, he goes to the best market.

5275. If the men were paid a good wage, would there not then be enough, and would they not work better?—No, they do not generally work better unless you train them.

5276. At any rate, it is a fact that the effect of the wages paid is to send him to the mines rather than the farm?—Yes, to a considerable extent.

5277. **(Mr. Tatlow.)** Is the co-operative movement being established in Natal at all among the farmers?—I have just got up from the executive meeting of the Co-operative Union. We have now about 1,500 members, which is a very good share of the farming population of Natal.

5278. Is that the dairying industry?—No, wattles, mealies, and cattle. There are three or four dairies, but not on co-operative lines.

5279. Does your organisation do anything practical to encourage the establishment of these societies? What do you call your organisation?—The Agricultural Co-operative Union.

5280. Do you do anything practical to help these societies to establish themselves?—No. Any farmer can join our Society.

5281. What are the aims and objects of your Union?—To bring the produce of the farmers to market in the best way and cheapest manner, and to help them to get the best price for their produce; also to help them to get manures and implements at the lowest rate.

5282. Are you assisted in any way by the Government?—No, it is entirely self-supporting.

5283. It is purely a voluntary organisation?—Yes.

5284. How long has it been in existence?—About three years. There is a small capital. The shares are 5*l.* No man can have more than five shares.

5285. Is all Natal represented in your Union?—I think so. Our membership is increasing very very rapidly. Three or four hundred of our members have joined in the last six months.

5286. What constitutes membership? — Merely taking out a 5*l.* share, which can be paid up in ten years or all at once.

5287. Does the holder get any return on that at present?—No, not yet.

5288. Do you give any instruction on agriculture?—No, not yet.

5289. You have no staff in the way of skilled inspectors?—No, only a secretary, with a staff of clerks.

5290. Do you look forward to developing into something more useful even than your present functions? Do you expect to enlarge your sphere of operations?—Well, first of all, we would desire to see a reserve of capital, before we went much further. We are passing something like 200,000*l.* a year through our hands on a very small capital. We have no opportunity of enlarging our sphere of activity in the direction you speak of at the present time.

5291. Perhaps that may come?—Yes, we hope so.

5292. **(Mr. Garnett.)** Can you tell us shortly what steps have been taken and what progress has been made in improving your stock of cattle, sheep, and horses?—Well, I have no figures before me, but there is a very large importation. Hundreds of animals are brought out. I brought a dozen Jerseys the other day. I have taken to Jersey cattle now as a little amusement. I am retired now from all active work, and under this "no-freight" system there are hundreds brought from England and Holland and other countries. Sheep from Australia, horses from England and Australia. The Co-operative Union has been instrumental in bringing out a good many sheep from Australia. We take orders from farmers and see to them being brought.

5293. Are there many stud rams?—A good many stud rams and ewes. I am also President of the Royal Agricultural Society of Natal, which has its grounds down here, and the grounds are available for sheep which are being brought here to be sold. They have the use of the grounds there. They hire the show yard to place the sheep in while being sold.

5294. What class of horses are being brought?—All classes, from the blood to the heavy horse. Hackneys, percherons, and all kinds.

5295. Have you any export in horses?—No. The Orange Free State is much better suited for horse-breeding than Natal.

5296. I gather a great deal has been done to improve the breed?—Yes, during the last twelve months. We are about recovered from the East Coast fever, when our flocks were killed out in thousands. And many are now stocking with a better class of cattle.

5297. When that process is completed, the country will be stocked with a better class than before the sickness came?—Yes, we hope so, but unfortunately there is a class being brought in in large numbers from the interior which to some extent has done away with the good blood.

5298. But, on the whole, you are satisfied that good progress is being made?—Yes.

5299. **(Mr. Sinclair.)** Before East Coast fever swept away so many cattle there were a number of farmers who relied on cattle-farming alone, were there not?—Yes, before rinderpest came among the cattle there were a great many more. The rinderpest was in 1897 and the East Coast fever was only about five years ago.

5300. Has one result of that sweeping away of the cattle been to drive farmers into mixed farming more than formerly?—It has had that tendency undoubtedly. Men are now doing much more cultivation than before these cattle plagues came into the country.

5301. **(Sir Alfred Bateman to Mr. Marwick.)** I understand you supplement Mr. Scott's evidence?—I fully endorse the bulk of Mr. Scott's views, but I do not quite see eye to eye with him in one or two things. The first point was about native wages. Mr. Scott was asked whether if higher wages were paid to the natives they would work more. Well, my own opinion, and I am certain that I am correct, is that under present conditions the higher the wages paid to the natives the less they will work. They would be able to earn the money necessary to satisfy their requirements in a shorter time, and they would have all the more time to play and rest. The native's idea about work is not the same as the white man's. The native's idea is that he should only work a very little, and when he has married a wife or two he should not work at all.

5302. Is there any other point?—Mr. Scott has mentioned to you about the large importation of cattle and stock to improve the breed. The principal reason for the large importations of stock lately has been the offer of free freights by the shipping company, and also the fact that the red-water is no longer feared. A few years ago, before the East Coast fever came along, and previous to dipping, 95 per cent. of imported animals died of red-water, but since then the percentage has been reduced so much that people will now risk it. Formerly, it was only a few moneyed men who could afford to import cattle. It was impossible to have done that under the old conditions owing to the serious risk involved.

5303. Have you any other matter to bring forward?—**(Mr. Woollatt.)** I should like to say that I think South Africa has a great future as a cattle country, and Natal in particular. As Mr. Scott has pointed out, most of these diseases which we suffered from have now been overcome, and I think Natal compares with any country in the world as a cattle country. I do not think it will be a great many years

before we see beef exported from South Africa. During the last three or four years we have had exceptional droughts, but I do not think we ought to let those act as a sort of indicator as to what we should expect in the future, and the same applies to mealies. I differ from Mr. Scott on that point, and I think that with proper agricultural methods South Africa will be a great exporter of mealies in the future. Mealies is a crop that will stand a lot of drought if it is properly treated, but in the past, with certain exceptions, mealies have not been properly treated.

5304. How about dairy produce, will you do without importing that?—Yes, and I think that a great change will come about. We have always looked upon the coast lands as not suitable for farming cattle on account of the tick, but now since these dipping methods have been in vogue we have gradually improved, and I think we shall see a big advance in the dairy industry in South Africa during the next few years, and it will be conducted on the coast lands.

5305. **(Mr. Garnett.)** With regard to imported cattle, that is cattle imported from England or Holland under guarantee or veterinary certificate that they were free from tuberculosis, have you ever known them to react here when they have been landed?—Yes.

5306. I should like very much to hear about it?—**(Mr. Woollatt.)** This is a matter we have been considering for some time. I have imported a lot of cattle and still import them, but the trouble is if they are condemned in England we are saved expense, but if they are condemned here we are the losers. Roughly it costs nearly 10*l.* a head to bring a beast out. Although they say they bring them free as regards freight they do not come entirely free. There is insurance and other charges to pay, and it generally comes to 10*l.* before the beast is landed on your farm. We are now asking the Government to establish a quarantine station in England, and allow these animals to be tested under Board of Agriculture supervision in England. That would do away with the second testing and obviate the 30 days' quarantine on this side.

5307. But the point I wish to get at is this. It has been represented to us that animals have been tested in England and have received a certificate although they were really suffering from tuberculosis, and when they were landed and quarantined in this country they have reacted to the tuberculosis test, and the explanation of that was that the animals had in some way or another been subjected to a dope, which for the moment had rendered it impossible for the disease to be detected because the animal would not react to the tuberculosis test, but when the animal had got out to this country and the effects of the dope had worn off it reacted to the tuberculosis test. It has also been stated that the breeders in England and Holland would not agree to a quarantine station at the other side. Can you tell us anything about that?—Well, cattle have certainly come here with certificates and have reacted to the test and have been destroyed. I myself was Chief Veterinary Surgeon for Natal at one time, and our Act required that the animal should be tested here, and in those days we found animals from Australia and England which arrived with certificates reacted to the test and had to be destroyed; but it does not necessarily follow that they were doped, it may be that there was an incubative period during the progress of the test or that they caught the disease in transit here. I understand that is one of the objections which the Government have now to a quarantine station in England. They are not able to say that the animals are free from disease on landing. You may be aware that the American authorities always insist on testing the animals on that side. I have seen cattle tested in the Cape Province and tested in Natal where they have reacted.

5308. So it would be too general an inference to make that there had been collusion or dishonesty?—Yes, it would depend on the lesion entirely. One could form an opinion only after post-mortem.

5309. Then you are of opinion that tuberculosis might have been contracted by the animals in transit between England or Holland and South Africa?—Yes, or there may have been an incubative period during the time they were tested.

5310. So it would be too broad an inference to impute bad faith in every case?—Yes.

5311. But in any case the buyer here has to make a dead loss?—Yes.

5312. **(Mr. Sinclair.)** You, Mr. Woollatt, just now expressed the belief that in a comparatively short time you hoped South Africa would be exporting beef; do you also believe that within a time that is within sight she will also be exporting frozen mutton?—**(Mr. Woollatt.)** No, I think not.

5313. I mean, of course, when you have grown enough to supply your own requirements?—With mutton it is a different thing. The sheep in South Africa appear to have more value for the wool than for the carcase, and while there are such enormous areas suitable for wool, farmers are not disposed to go in for mutton.

5314. Then you think the day is very far off for that?—Chiefly because our class of mutton cannot compete with that grown elsewhere.

5315. **(Sir Rider Haggard.)** With reference to the prospects of Natal's agriculture, I gather that you both think those prospects are good?—**(Mr. Marwick.)** Yes, I do, for those who are capable and willing to work.

5316. And are you referring to the old large system of farming, or to the small system?—Both. The farms are being cut up.

5317. You think in both cases the prospects are good?—Yes.

5318. One of you gentlemen mentioned the matter of droughts; are they not increasing in quantity?—They appear to be increasing and recurring oftener.

5319. You are aware that there is a body of opinion which thinks there is a good deal of drying up going on?—There have appeared in the Press considerable articles about it, and from what I have seen myself, as long as I can remember, I think there is something in it. It appears to be so.

5320. Do not you think that adequate legislation about grass fires and afforestation, and the preventing of old roads changing into sluits might do something to check it?—No I have a theory myself—I do not say it is true—that when we imported the Australian trees to the extent we did, such as the wattle and the blue gum, we brought with them the drought and dry climate.

5321. Well, at any rate, those droughts are sufficiently bad, are they not, to cause you to be a little cautious and to take a not too optimistic view of the future of agriculture?—I expect they have had droughts before and things have righted themselves.

5322. Have you been in the Free State lately?—No, not for some time.

5323. I think if you saw the droughts there it might tend to check your enthusiasm?—Possibly. I know they have been severe.

5324. But otherwise, putting aside the droughts, you are both of opinion that there is a good outlook?—Yes.

5325. We are told, in some parts the farms are stocked up to their full capacity—that they have as much stock as they can carry. What is your opinion?—**(Mr. Woollatt.)** I do not agree. **(Mr. Marwick.)** No. There are portions that have pretty well as much stock as they can carry under the present methods of handling.

5326. You were suggesting that there might soon be seen a beef export from Natal?—**(Mr. Woollatt.)** No, from South Africa.

5327. How do you reconcile that statement, if it be a true statement, and it is no doubt partially true, with the belief that the farms are carrying what they can already, with a possibility of an export in meat?—**(Mr. Marwick.)** A proportion of the farms are carrying what they can, but a large number are carrying no

stock at all. They have been blotted out by East Coast fever.

5328. But tell me, is it a common practice for people here to lay in winter feed?—**(Mr. Woollatt.)** In Natal it is the usual practice.

5329. But in many parts of South Africa no winter feed is grown?—Quite so.

5330. In that case, a farm can only carry stock to its winter limit?—Yes.

5331. Then what you are really looking to when you talk of the prospect of an export trade in meat is a day when farming, taking South Africa as a whole, has very much changed its character?—Then again, we have these big ranching companies starting with this very purpose in areas in which it was not altogether safe to ranch cattle in the past until we had this system of dipping. Their sole object is to raise cattle for these purposes. Rhodesia last year bought thousands of heifers in the Free State for this purpose of ranching, and I understand this winter—because it is not safe to take Free State cattle to Rhodesia in the summer—she will buy thousands of heifers again.

5332. It will involve a different system of farming?—Not necessarily, because when they have these large areas they will kill their cattle at the plentiful season, which is at that time of the year when the cattle are fat.

5333. Even on the old system?—Yes, at certain times of the year, and using the chilling and freezing apparatus.

5334. As a matter of fact, the land could really carry an enormous amount more stock, could it not, if reasonable methods of providing food for winter use were adopted?—Undoubtedly.

Pietermaritzburg, Nel's Rust Farm, Saturday, 28th March 1914.

Senator The Hon. Joseph Baynes, C.M.G., Farmer, called and examined.

(*For the evidence of this witness on "Migration, Land Settlement, and Irrigation," see p.* 44.)

5335. **(Sir Alfred Bateman.)** You are so good as to give us some evidence about your experience in regard to farming in this country. In what order would you like to give it? Have you prepared any statement?—I will just go on with my notes. Well, gentlemen, I am very pleased indeed to welcome you here as representing the Dominions Royal Commission. It is a new departure, I think, as far as the British Empire is concerned, and indeed, I believe, as far as the world is concerned. I have not heard of any similar Commission before, and I am proud to welcome you here to-day. I believe that immense good will result. It is the initiation of a system that will lead to no end of advantage to the Empire, I hope. And I am specially pleased to have you visit this farm, because in the first place, this is the first successful dairy established in South Africa. There are others which have since been established, but I believe their success followed the success of the dairy here. This dairy was started in 1899, just before the war, and, of course, as a result of that, very little progress was made for some years, and to take the year 1902, 5,562 pounds of butter was the largest output in any month.

5336. From this property?—From the butter factory. In December 1909 the record output for any month was 179,595 pounds. That shows the advance that had been made. In January 1910 we opened another dairy in the Orange Free State, at Harrismith. That is on a larger scale than this. It was built after we had got the experience here, and it was built on more up-to-date lines than this one. In 1913, notwithstanding the building of that dairy at Harrismith, notwithstanding the drought, notwithstanding the East Coast fever, and notwithstanding the large additional competition in 1913, the output for the same month at Nel's Rust, Natal, was 110,000 pounds. You see that Harrismith had turned off half the supplies, or more than half, but notwithstanding those disadvantages, the output was 110,000 pounds. That was for the month of December 1913.

5337. You speak of "we"; who are "we"?—I am speaking now of the Nel's Rust Dairy as a branch of the company Joseph Baynes, Limited.

5338. When was that Company formed?—The Company was formed on the 31st March 1911. Up till then the Nel's Rust dairy or butter factory was my own property. It is still my own, in fact, as it is only leased to the Company. In speaking about the dairy, I am referring to the time prior to the formation of the Company, and subsequently. I do so in order to show the great advance of dairying in this country in face of all the obstacles I have enumerated. And that advance, I think, will go on in the future at a much greater ratio than in the past. I believe that, given good seasons from now on, which we have every right to expect, the progress will be even more satisfactory. I suppose that Africa is very much the same to-day as it was in the days of the Pharoahs, when they had the seven years of famine and the seven years of abundance. We cannot have these continuous droughts for ever. I have reason to feel hopeful also because of the improvement that has been, and is being, made in the milking strain of our cattle, for instance, and the large numbers of imported pedigree cattle that are now arriving here as a result of the free freight established by the Union-Castle Company. That will effect a great improvement. The cattle of the country have not been dairying cattle up till recently. Then, again, the method of farming has improved very greatly, as you will see from the buildings that are in the country now, as compared with those that were here only a few years ago. Also, because of the eradication of the tick, it is quite possible for dairy farming to be established on a large scale on our coast lands, and that I regard as a very important matter indeed, for the reason that the conditions on the coast are to my mind very suitable for dairying. The conditions of feeding are also better there than on the uplands here. There farmers can grow sugar-cane to feed the cattle with, which I know is a very valuable food for cattle—at all events for dry cattle—that is cattle not being milked. For trek oxen, or cattle not being milked you do not want anything better than sugar-cane. Then, one of the best foods, and it can be grown without limit on the coast, is the sweet potato. Further there is no need to house the cattle in winter, because there is no cold to speak of, and also there is no need to worry about the heat in summer, because there is any amount of tree shade. Where there are coarse grasses unsuitable for cattle, the farmer can plough those up, and put in paspalum or other grasses which will make the coast lands as valuable as any land can possibly be for dairy farming. So that altogether I feel quite sure that the success of dairy farming will be very great on the coast.

5339. I think you are going to tell us something about the position of your company—whether it is co-operative or not, how much land you draw your supplies from, and so on?—This dairy (Nel's Rust) is at present drawing supplies from Zululand, from Matatiele—at the extreme end of East Griqualand—and numerous other places. Some people in the Free State continue to send here notwithstanding the dairies in the Free State. We are drawing supplies from all over Natal, from the North Coast and the South Coast, and even in some cases from the Transvaal.

5340. How many miles?—Hundreds of miles in each direction.

5341. **(Mr. Bowring.)** How is it forwarded—by rail or road?—The supplier sends his cream to the nearest railway station, and from the nearest railway station the Company pays railage to the dairy.

5342. **(Mr. Tatlow.)** Is it the milk he sends or the cream?—It is the cream. Each farmer has his own separating plant.

5343. **(Sir Alfred Bateman.)** Perhaps you have all these particulars in some report or memorandum which you could let us have—how much you pay a gallon for cream,* and what the contract is, and so on. If so, you might send the statement to the Commission. Also whether the Company is co-operative, and whether the suppliers of the cream share in the profits. All that information we should like to have?—I will give you a memorandum.†

5344. **(Mr. Sinclair.)** The constitution of the Company would, I suppose, supply all those particulars.

5345. **(Sir Alfred Bateman.)** Yes, and the balance sheet, the last report, and the profit and loss account?—The head office of the Company is at Pietermaritzburg, and we can supply the information desired. Joseph Baynes, Limited, was not formed as a co-operative Company, although the policy of the Company is practically on that basis, and it is my intention next month, when I shall be Managing Director, to conduct it more on those lines. But it was not established under the title of a co-operative concern at all, although it has been working as much on the co-operative principle as any co-operative business anywhere in the country, and it will continue to do that. That is its purpose.

5346. Then to come to the next point, I think you are interested in closer settlement?—Yes, I believe that with dairies and piggeries, the coast lands will be admirably adapted for closer settlement. The possibilities of the food supply there are very great indeed. I have spoken about drought and East Coast fever, and you can understand how cattle were practically wiped out, and how it affected farming. Now, there is one difficulty that we will have to contend with, and I should like to speak of it, as I think it will do serious harm in the future—that is the tendency to build innumerable butter factories in the districts already served. You will, of course, understand that when you multiply the factories, you multiply the costs of manufacture. And the cost of manufacture you cannot reduce. You must, in order to succeed, deal with the business properly. You must have an efficient and expert staff, and unless you have such a staff you are bound to make inferior butter. With an inefficient staff and inefficient buildings you cannot deal with the industry on a proper footing. You must have adequate cold storage, and even then these small factories will have all they can do to make good quality butter.

5347. You will give us particulars of your staff, the labour you employ, how much is white, how much coloured, and what wages are paid?—I will prepare these for you.‡ Another question has cropped up lately in connection with this dairy movement. The Government has been supporting dairies all along. I mean with money. But there is only one dairy, so far as I know, receiving support from the Government, that has been successful. I refer to the Tweespruit Dairy in the Free State. That was started under the auspices of Sir Hamilton Goold-Adams.

5348. He was Governor seven years ago at Bloemfontein, when I was here?—Yes. I think that is the only dairy started in that way that the Government has not wasted money on. But before it was firmly established, and its success assured, the Government handed it over to the farmers at a peppercorn rent of 1*s.* a year. I think something of that sort.

5349. **(Mr. Bowring.)** What did it cost the Government?—Several thousands of pounds, I suppose. They are still adopting this principle of advancing money to so called co-operative concerns. These co-operative dairies, and the multiplication of dairies in the country where it is impossible to get any great quantity of cream, must do a very great deal to increase the cost of manufacture of the butter. A dairy with a small supply of cream has to get its work done efficiently and successfully the same as a big establishment, and it has to provide an adequate staff, and well trained people, and I do not believe that you can afford to have that well-trained staff where the production is only comparatively small.

5350. **(Sir Alfred Bateman.)** The fixed charges are so large?—Yes. I believe that the Government is making a mistake by going on these lines. Then, again, that raises the question of the danger of producing inferior butter, because these small dairies cannot afford to pay the necessary staffs, and the result will probably be the production of an inferior article, which may have to go across the water to find a market, doing infinite harm to the industry which it is sought to establish.

5351. Yours is a superior article?—We claim to make at all events the best quality of butter here. I would like to give you an illustration. Last winter, because of the drought and one thing and another, we thought it was advisable to import. But so long as we were putting out butter ourselves, our customers would not take the imported article, although we imported the very best New Zealand article.

5352. What price do you get for your butter, winter and summer?—At the present time we are getting 1*s.* 5*d.*, 1*s.* 4*d.*, and 1*s.* 3*d.* per lb. We make three different qualities—the Fern Leaf, the Ivy Leaf, and the Oak Leaf.

5353 Where? At the factory?—In Durban, Johannesburg, and Maritzburg.

5354. All delivered there?—Yes, delivered at those centres.

5355. You pay carriage, I suppose?—Yes. That is the wholesale price, of course. Threepence or fourpence goes on to the retail price.

5356. Do they get New Zealand butter?—A good deal is imported by various people. We have a business in Johannesburg also. When you are there I shall be glad if you will call and see the dairies and tea rooms. The dairy is at Braamfontein, and I think you will see that we have there the most modern appliances in that line. In connection with the mischief of too many dairies, I will put in some papers* that will deal with that, prepared by the Chief Government Dairy Expert—Mr. Challis. He was formerly Government Dairy Instructor for Natal.

5357. He condemns the small dairy?—Yes; he condemns too many dairies, very strongly. But the system is still going on, because the question was raised in the House the other day about the contribution by the Government to a so-called co-operative dairy in the Transvaal, near our own dairy, and one in the Free State not far from one of our own dairies there.

5358. I see that Mr. Jagger drew attention to it, but his motion was lost?—Yes, but, of course, all these motions are lost. The reason is obvious. The bulk of the members do not know the true conditions, and

---

* *The witness subsequently furnished the following particulars:—*

Milk.—To farmers in Natal, 9*d.* per gallon all the year round; to farmers in Transvaal, 10*d.* to 1*s.* 2*d.* per gallon according to season.

For butterfat in cream, supplied to the Nel's Rust Dairies, in all Provinces:—

For superfine cream -	- 1*s.* 2*d.* per lb. butterfat.
For 1st grade cream -	- 1*s.* 1*d.* per lb. butterfat.
For 2nd grade cream	- 1*s.* per lb. butterfat.

(The Company pay railage.)

Where *cartage* is arranged by the Company, the usual charge is ½*d.* per lb. net for distances up to 30 miles, and 1*d.* per lb. of cream over 30 miles, which is paid by the farmer, or deducted from his cream account.

† Not reprinted.

‡ *The witness subsequently furnished the following information:—*

Labour employed by Joseph Baynes Ltd.—Europeans 190 (approx.) Coloured, 350 (approx.).

Wages paid.—The wages of the European Staff vary from 10*l.* to 30*l.* per month (male) and 6*l.* to 12*l.* for waitresses and Manageresses. Managers of some factories are paid more than 30*l.* per month. The coloured staff (natives and Indians) receive wages ranging from 2*l.* to 4*l.* per month, with free rations, quarters, or houses.

* Not reprinted.

many of them are interested in co-operative dairies, no doubt, or have received assistance in the past. Now the prices for butter-fat here are, I believe, higher than in any other part of the world. The prices to-day (or they will be from the first of next month) are 1*s*., 1*s*. 1*d*., and 1*s*. 2*d*. for the different grades per lb. of butter-fat. As the winter advances they will go higher. As I mentioned just now, we make three grades of butter here—the Fern Leaf, the Ivy Leaf, and the Oak Leaf.

5359. Those are your trade marks?—Yes. I do not think I have anything more to say about dairying. I will now go on to the bacon factory. In connection with dairying it was considered that it was desirable to establish a bacon factory, because the two should go together. Where the farmer separates his milk and sends the cream to the factory, there is nothing better he can do with his milk than to feed pigs. Now if you are going to have a large pig industry in the country you want a bacon factory to deal with it, and therefore we established such a factory here. I believe that bacon-curing in this country will be eminently successful in course of time. It has had its drawbacks, one way and another. Just as farmers were beginning to breed a proper class of pig to send to the bacon factory, within proper weights, the drought came, and mealies went up to 1*l*. per muid of 200 lbs., and the farmers got alarmed about it and sold their pigs as hard as they could, and now the bacon factory is there and can deal with 1,000 pigs a month, but it is barely getting 400.

5360. Is that on the same basis as your dairy?—Yes; it belongs to the Company—Joseph Baynes, Limited.

5361. We shall doubtless have an account of the bacon factory in the report?—Yes, in the memorandum.*

5362. I gather that it has not been entirely successful?—Well, like all new industries, it has had all kinds of difficulties to meet with at the beginning, but it has met those difficulties successfully, and now, although the output is quite small, it still pays its way, and leaves a margin of profit. But the difficulties in starting an industry like that are very great. You have to educate the farmer first of all to the class of pig you require if he has not been in the habit of breeding any particular pig. Because to make good bacon you must have the right pig.

5363. What is your pig?—I have here the Berkshire and the large black. I cross the large black sow with the Berkshire boar. We have very little protection for the bacon industry in the way of Customs duties on the imports of bacon and so on. But I think the farmers will very shortly learn that it will be more profitable to them to put their mealies into bacon rather than export them, and they will come into it before very long. As I say, I do not think there is any country in the world more adapted for bacon-curing than this. Closer settlement, again, would help the pig industry very considerably.

5364. Now, about the eradication of tick diseases by dipping?—I started dipping in January 1902 from information I received from North Queensland.

5365. (**Sir Rider Haggard.**) Were you the first to start dipping?—Yes, cattle dipping. I was the first in South Africa—the first in Africa, I think, as far as that is concerned. I realised that to farm under the conditions I have already mentioned with the tick to contend with was impossible in dairying or stock raising or any other way. Nobody ever dreamt of farming cattle on the coast, because of the tick. I never dreamt of eradicating the tick at that time, because it seemed impossible to eradicate them from the veldt. If one could moderately reduce the number of ticks, until they had no effect on the cattle, that, to my mind, was all that could be hoped, and that was all I was looking forward to. The East Coast fever came along then. That was the most serious disease carried by the tick, but not by the tick that carried red-water—the very reason why dipping was put down in Queensland—but by a flat brown tick. The tick that carries red-water is distinguished from the other by its colour. It is a large blue tick, and that did not carry the disease itself, but it carried it through the egg—that is, the next generation. I am speaking of red-water now. It was from the egg of the tick that got on to the diseased animal. But East Coast fever was carried in a different manner altogether and by a different tick. The blue tick only gets on the animal once, and remains on until it is engorged and drops off to lay its eggs. Therefore, it could only carry it through the egg. But East Coast fever is carried by the tick that gets on the diseased animal. It is only on a few hours or days, at the most, drops off, casts its skin, gets on an animal again, and if it gets on a diseased beast the first time, the second time it gets on it carries the disease. Well, with this tick getting on one animal and then falling off and getting on another, three times in succession at least, it was difficult to "nobble" him. You might dip and dip and dip, and yet not nobble the tick, because he was possibly on the ground at the time. That resulted in the Natal Government asking Mr. Watkins Pitchford, who was the bacteriologist at the time, to try and invent a dip that could be used, and he evolved a dip that you would use every three days without injuring the animal, and so by the frequent dipping we were able to nobble the brown tick.

5366. When was that?—I put in for you a paper giving the whole history of this dipping business.* It was in consequence of the East Coast fever, therefore, that we had to find means of destroying the ticks more frequently than by the use of the Queensland dip. On account of its strength and composition, to start with, you could not use the dip more frequently than once a week, and weekly dippings would not suffice to get at the brown tick. I was using a dressing on the cattle, in between the weekly dippings, and I clipped the hair from their tails and from the sheath, so as to get the dip to every part affected.

5367. What was the result? Did you get rid of the tick?—Well, the result is that you may examine my cattle as close as you like, and you will not find a single tick, whereas before the ticks were as dense as possible on the animals.

5368. Have they now all been absorbed?—They must have been taken up, or they would get on the cattle.

5369. Have not the cattle collected most of the ticks off the veldt now and have they not been destroyed in the dipping?—Yes. That is the case. The cattle collect the ticks, and by the dipping and by one means and another we kill the ticks, and so there are none left to carry on the propagation of the tick. In this connection, I will give you another illustration of the way in which we have been able to fight these plagues that have been such a bane to the country in times past, and that is in regard to the locust plague. Means have now been found to eliminate that pest. Natal is in the proud position of having discovered a means by which the locust plague should not occur again. It is so simple, and I want to emphasise this point, because we do not realise the benefit to humanity of the discovery made by Anthony Wilkinson of Ottawa. We were troubled with flights of locusts that destroyed the vegetation, that left orange trees with the oranges hanging on the branches and not a single leaf, that left the ground by the side of the rivers absolutely bare of grass. They were all over the country and destroyed pretty nearly all the vegetation that existed. The sugar planters were getting very concerned about these invasions. Well, Anthony Wilkinson got the arsenical spray, and he first cut and sprayed some sugar cane tops with this arsenical preparation, for the voetgangers, as the hopping locusts are called, to eat. They seemed to appreciate a little treacle along with the arsenic. He spread these cane tops about, and the locusts ate and died in millions. Later on, we got the knapsack spray. We mixed water, and sugar or treacle, and arsenic or arsenate of soda. We did not use arsenate of soda at first, only arsenic and soda separately, and

* Not reprinted.

these with sugar or treacle and water were all combined together, and if a man went with this knapsack spray and pump on his shoulder, pumping with one hand and spraying with the other when the locusts were clustered together, he could destroy them in millions. When the locusts come out of their eggs, they collect in closely packed clumps : well, with this spray pump the liquid is sprayed over these clumps, and the locusts are destroyed in the simplest manner possible. And now if the authorities will only take steps in time, and find where the locusts are depositing their eggs, and be ready by the time the young locusts emerge, they can with very little expense and trouble destroy every swarm. That can be done all over the country, so that the locust invasion should now be a thing of the past. Wilkinson has conferred a great benefit on his country by his simple discovery. Then also, the dipping I referred to just now, which eradicated East Coast fever, has also been instrumental in eradicating other cattle diseases. As with dipping for the East Coast fever—so with the dipping of horses in regard to horse sickness. Those responsible to the Government for these matters, for some reason or other, are not entirely in sympathy with this matter of dipping. For instance, the Government went on slaughtering cattle long after it was demonstrated that it was possible to combat the disease by dipping.

5370. **(Sir Alfred Bateman.)** The Union Government?—Yes. They went on slaughtering to such an extent among the natives that if they had slaughtered many more cattle there would have been a native rebellion in the Transkei Territories. That is what led the Government to stop the slaughter. I firmly believe that the frequent dipping of horses will equally prevent horse sickness, as it has done East Coast fever.

5371. Has it been tried?—Yes, up and down the country. I believe that it will stop horse sickness, for the simple reason that it will to a very great extent prevent the mosquito, which carries horse sickness, from biting the animal, and, if it does bite I believe that the arsenical impregnation of the skin will kill the venom of the mosquito. That is my opinion. But I do know that continuous dipping has eliminated very many diseases from my own live-stock, and I firmly believe that it will eliminate horse sickness if properly used.

5372. Is there anything else?—Then, as regards General Gorgas's work in the eradication of the malarial mosquito on the Panama Canal, I believe that will be of immense benefit to this country, too. That work will extend to this country and into the tropical regions of Africa and elsewhere, and the benefit to be derived therefrom is incalculable. We have now control of the tick, we have control of the locust, and I believe we will eliminate malaria and other diseases from all our tropical and sub-tropical regions. And the effect of these measures will be something marvellous.

5373. **(Sir Rider Haggard.)** What is the name of this dairy company?—"Joseph Baynes, Limited."

5374. What is the capital?—175,000*l.*

5375. What dividends do you pay?—We have paid two dividends. The first dividend was for eighteen months, and that was 8 per cent., and the second dividend was 5½ per cent. for the twelve months.

5376. Do all the shares belong to you?—They are held by myself and others.

5377. You say it is run on co-operative lines?—Yes.

5378. Do you follow the rules of the Danish co-operative dairies?—It is my intention. We pay the highest prices up to now of any dairy company in South Africa, but by one reason and another we have been unable to pay any larger dividends or bonuses, especially owing to the drought lately. We have only been running three years as a company. Previous to that it was purely my own property.

5379. Do you intend to turn it into an actual co-operative company, or merely to follow the usual co-operative rules?—It is the wish of the directors to work on the best co-operative principles, so far as securing the greatest possible benefit to the farmer is concerned; and, when such is possible, in addition to paying good prices for butterfat, we intend to pay a bonus to the suppliers. (*See* last Report of Directors.)

5380. **(Sir Alfred Bateman.)** You are the Company?—No. It is managed by a board of directors, but I hold the controlling interest.

5381. **(Sir Rider Haggard.)** You mean to run it on co-operative lines, but not to turn it into a co-operative company?—That is my purpose.

5382. And you object, you say, to the establishment of a number of co-operative companies all over South Africa?—Yes, all over the country, I do.

5383. And the reasons you have given—you need not repeat them—but I would ask—does not the question of distance enter into the matter—the sending of the cream so many hundreds of miles, which you must do, unless there are factories at hand?—We make three grades, and, given proper treatment, from the longest distance we can make the first grade butter.

5384. But there is the question of carriage?—Yes.

5385. The carriage must come heavy if you send from the other side of the Free State here?—The railage is paid by the Company—and not by the supplier.

5386. But somebody has to pay it, whether the Company or the supplier ; it must increase the cost?—It does not make much difference

5387. Well, Denmark is the premier country in the world in reference to co-operative dairy matters, and there they have factories every few miles?—They have a very big and dense population there too.

5388. The carriage is very cheap on the Danish railways, but nevertheless they do find it desirable not to draw supplies from too large an area. You think that does not apply here?—I do not think it applies in Denmark either.

5389. Well, those people are very hard-headed, and know their business pretty well. But at any rate, you think that their plan would not suit here?—I do believe that you can make as good butter from one dairy in Denmark as from a number of dairies up and down the country. I have been in Denmark, and I know. And I have had Danish dairymen here also.

5390. Now I want to put one general question. With all these boons as the result of dipping and so on, what do you consider the general prospects of farming in Natal?—I have already expressed my opinion, that there is no part of the world that I would rather farm in than this.

5391. I thought you said that because of its agreeableness, but what are the prospects from a remunerative point of view?—Well, I do not think there is any part of the world where farmers are better off than they are here.

5392. Then you have a high opinion of the future of South African farming in general and Natal farming in particular?—There is, of course, the question of the native and the European. At every election there is a cry to do something to make this a white man's country. Well, to do that you would have to exterminate the native, and that, I would hope, will never be done.

5393. Do you consider that South African farming in general and Natal farming in particular offers good prospects as an investment from a business point of view?—Yes, I think so. I do not think there are any people better off than the Natal farmer.

5394. Then you consider that they can not only make a good living, but possibly lay something aside? I know many who have done so who started with nothing and are very prosperous men to-day.

5395. Do you consider that the price of land to-day is fair and just, or do you consider it inflated?—A man should have no difficulty in making a good return on the land at the price it is to-day.

5396. In other words, you think it is inflated?—I think the price of land is perhaps quite as high as there is any warrant for.

5397. If not higher?—Well, some will think that it is higher.

5398. **(Mr. Sinclair.)** Your dairy company, I understand, was the pioneer company in Natal, was it not?—This was the first successful dairy, but not the first

dairy company. Our company was only formed in 1911.

5399. There are other companies carrying on business in the locality, are there not?—Yes.

5400. Has the general effect of the system been to bring about an improvement of the dairy cattle and a larger production than before?—Yes.

5401. That has been the general effect of the whole system?—Yes, undoubtedly.

5402. What is the value of land that can be profitably employed for dairy purposes?—I am afraid I cannot say.

5403. Can you not give us the average?—I am afraid I cannot. Those are matters that I have not gone into very much because they have never affected me. I have a large area here and the price was very moderate when I secured that area.

5404. You said just now in answer to Sir Rider Haggard that you thought the value of land here, and you are speaking of dairy land, I take it, is inflated. I want to get from you an idea of the capital value of the land that could be profitably utilised for dairy purposes?—It would depend on its locality. I believe that land on the coast would be more valuable than land in Natal at a higher elevation, because I believe on the coast you can grow food most advantageously for cattle.

5405. I have in my mind the value of land that can be profitably utilised for dairying purposes in New Zealand, and I wanted, if possible, to see what the value of your land was so as to make a comparison. Can you make land worth 15*l*. an acre pay?—I cannot speak from practical experience, but on the coast I believe they can. You can grow sugar-cane there for feeding the cattle and you can grow up to a maximum of 80 tons per acre per annum. That will give you an idea.

5406. Do you think that land worth 30*l*. per acre could here be profitably employed for dairy purposes?—Well, I would rather buy cheaper land myself.

5407. You referred just now to a country that can make dairying pay and can send its butter to England with its land at a higher price than the figures I have mentioned?—Well, I believe on the coast you can get land that will equal anything that you can get in New Zealand for dairying purposes. You may have to cultivate the grass the same as in New Zealand, and you can grow sugar-cane and sweet potatoes in a way that you cannot in New Zealand.

5408. In this country you have cheaper land and cheaper labour?—If it is possible in New Zealand to carry on dairy farming on land costing 30*l*. or more an acre, I think it would be equally possible here—that is on our coast lands.

5409. Then you ought to have a great industry with your natural advantages here?—Yes, I believe we shall, that is my opinion.

5410. Now you spoke about having too many factories, and you do not approve of that. You favour, I believe, small settlement?—On the coast I think small settlement could be very favourably placed.

5411. If you have small settlements must you not have dairy factories within reach?—That is not my experience.

5412. Take the case of the small settler who is not on the railway line. How is he to get his milk to the factory?—There would be stations all along the line, and he can send his cream to the station by road.

5413. I have in my mind a system of small farmers who co-operate in sending their cream or milk to the factory. Suppose a man has a small place with a few cows and only a little milk, it will not pay him to carry his milk a long distance, but if there is co-operation between a dozen farmers can they not do the business more economically. Is there nothing of that kind going on here?—My Company provides transport in some cases at long distances from the railway.

5414. **(Mr. Garnett.)** Can you give any particulars as to the kind of cattle which you find the most useful?—On my estate I confine myself, practically speaking, to only two breeds, the Shorthorn (Lincoln Red) and the Friesland. Ayrshires and Devons also do well, and are much favoured by farmers throughout South Africa.

5414A. Do you milk by machinery?—I do not favour milking by machinery in any circumstances.

5414B. What is the percentage of butterfat produced?—Taking the supply of butter-fat to the dairy at Nel's Rust, the average of low tests may be placed at 35 to 40 per cent. (butter-fat in cream), and the high tests at 50 to 55 per cent. Cream is sometimes received with butter-fat percentage as low as 30, and as high as 63 per cent.

5415. I should like to ask you what is the extreme distance from which you can get cream forwarded to you?—I get cream now from the extreme parts of Zululand, about 170 miles, and from Matatiele on the other side, up to 200 miles, say.

5416. What is your rate of carriage for that?—I cannot give you that off-hand, but I will put in a statement.

5417. **(Mr. Tatlow.)** Would you, when doing that, give also the rates from various stations, for distances of, say, 25, 50, 75, 100, and 150 miles?—Yes.

5418. **(Mr. Garnett.)** I wanted to see what was the extreme rate for the longest distance and the shortest, and so on?—I will give the rates up to 200 miles.*

5419. Is that your limit—200 miles?—No, in isolated cases we get cream from longer distances.

5420. Well, I would like to have the extreme distances?—The longest distance is from Greylingstad to Nel's Rust—349 miles.

5421. **(Mr. Bowring.)** In moving the cream these long distances what methods are taken to keep it sound and sweet?—If the cream is taken from the farm to the station in the best possible manner, that is, protected from the heat by wet canvas put round the can to keep it cool, then it can travel long distances and arrive at the dairy in good condition for first-class butter. The cream needs to be kept some time to ripen before it is churned.

5422. Even if it is days on the road?—Yes, if it starts perfectly sweet. If it leaves the farm directly after it has been separated and cooled and is brought to the station in good condition it will arrive at the factory in good condition.

5423. There is no necessity to sterilise the cream or anything of that kind, is there?—You can bring it long distances without sterilising if it arrives at the station in good condition, but when the cream has to travel very long distances, as it does in Griqualand East, by road and by rail, the damage is done very often before it gets to the railway.

5424. **(Mr. Tatlow.)** Is the cream carried in cans?—Yes.

5425. By goods train or passenger?—Mostly by passenger.

5426. Do they charge any more by passenger than by goods train?—The charge is the same.

5427. Do they carry the empty cans back free?—Yes.

5428. **(Mr. Garnett.)** What is the extreme distance that the cream is brought. What is the extreme distance that you collect it from the railway? How far has it to be driven to the railway?—The less the better. I will furnish information in my memorandum.

* *The witness subsequently furnished the following statement:—*

Railway Rates on Cream.

1—25	Miles	½*d*. per gallon of cream.
26—50	„	1*d*. „ „
51—75	„	1¼*d*. „ „
76—100	„	1½*d*. „ „
101—200	„	2*d*. „ „
201—250	„	2½*d*. „ „
251—300	„	3*d*. „ „
301—400	„	3½*d*. „ „
401—450	„	4*d*. „ „
451—500	„	4½*d*. „ „
501—550	„	5*d*. „ „
551—600	„	5½*d*. „ „

(Minimum of 3*d*. per consignment.)

5429. But how far from the railway does it pay to collect it?—In Griqualand East we are carrying cream long distances and there is no doubt deterioration takes place on the road.

5430. Can you say what is the limit that the cream can be brought by road?—It depends so much on the mode of transit, whether the conveyance is run by oxen, by horses, by mules, or by motor.

5431. I want to get the extreme distance which the cream is brought by road before it is put on rail?—Well, about 50 miles.

5432. And what is the length of the railway journey on top of that?—About 150 miles.

5433. Could you say how far it has to be driven to your 200 mile limit or over? What road journey does it have in addition to the 200 miles?—There is no long road journey, the farms being situated near the railway line.

5434. **(Sir Rider Haggard.)** I understand that dipping is compulsory by law, is it not?—I am afraid the law is not carried out even where it is compulsory. There is a compulsory Act for certain districts which are declared under the Act, the Act being permissive.

5435. Well, what is the state of the law as regards dipping?—I am afraid, if there is a law in existence supposed to enforce dipping, that that law is not carried out.

5436. Is there such a law?—We had laws in Natal before Union in which was a provision whereby a district could accept the law or not. It was optional.

5437. **(Sir Alfred Bateman.)** Do you mean province or district?—I mean the magisterial division. I think under the Act the Government can proclaim certain areas as infected and under the regulations they can compel dipping within those areas, but if there is no necessity to do it there is now no compulsory dipping.

5438. If the Government decides to declare an area infected, it is compulsory then?—Only as already stated.

5439. **(Mr. Garnett.)** I should like to ask whether there are any regulations prescribing dipping, say, in the Transkei and these other districts occupied by natives, which must, one would think, be infested with ticks and therefore be breeding grounds for the diffusion of the tick. Could you say if that is so?—The Government is controlled mostly by farmers and the farmers, many of them, are absolutely averse to anything of this kind; they are averse to the least compulsion, and the Government dare not to-day bring in a general compulsory Dipping Act over the Union.

5440. **(Sir Alfred Bateman.)** Well, you have given us very valuable information, and it is a pity that we have not more time to go further into these matters?—Thank you. I hope the information which I have given will be of assistance.

(The Commission then inspected the dairies.)

TRANSVAAL.

Pretoria, Monday, 30th March 1914.

Mr. Edmund Francis Bourke, President of the Pretoria Chamber of Commerce, called and examined.

(For the evidence of this witness on "Fruit," see p. 319; *and on "Mining," see p. 33 of* [*Cd.* 7707].)

5441. **(Chairman.)** Would you kindly give your evidence?—Yes. As regards the agricultural development of the Pretoria district, we wish to draw attention to the geographical position of Pretoria. It is on the railway at the converging point of the lines from the east, north, south, and Rustenburg districts. The agricultural and mineral development of those areas will flow through Pretoria, the bulk of it, and flowing through, its nearest way out is through Delagoa Bay. Then we also wish to point out that during the last three years we have suffered from drought in this part of the country. Before that time the export of maize had just commenced and had already reached large figures. In the following years, owing to the drought, the production of maize fell off, so much so that mealies which had been shipped to Europe had to be repurchased and brought back to this country again to supply the wants of the country owing to the shortfall on account of the drought. The area under cultivation in this district has enormously increased of late years, however, and given favourable years the output of maize alone from the Pretoria district, the Waterberg and Zoutpansberg districts, all of which, in addition to the Rustenberg district, will flow through this centre, that quantity will be very large. The quality of the grain produced about here is probably second to none in South Africa, and the London market pronounces it to be some of the best that reaches that market. We would also like to draw attention to the fact that the production of tobacco already in the Rustenburg district has reached such proportions that they can no longer consume it locally, and enormous quantities are stored. We are now waiting for some method of preparation which will enable the market to be further extended, and there is no doubt that tobacco-growing will be greatly changed before long, as regards the methods of culture. They will have to be changed in order to capture the European markets, but we have every indication that we are on the right lines, and it will not be long before we are able to produce the required article. Then the tobacco in the northern districts of the Zoutpansberg amounted in 1911 to 5,166 lbs. and the population of natives in that district was 132,215, men only 89,215; of those seeking passes on the Witwatersrand, men were only 26,608 in 1912. We should like to point out also that already the Government has recognised the necessity of giving support in order to encourage the exportation of our maize by giving a flat rate on all maize exported to the London market. We want that same principle applied to shipments of ores that will enable the districts in which we are concerned to develop more rapidly.

5442. **(Mr. Campbell.)** The whole of the Transvaal practically is a good country in which to grow maize, is it not?—On the high veldt they are hampered at times by early frosts. If they get early rains on the high veldt it is also a big producing area, but we in this district are more favoured, because our frosts come later, and our maize is of a higher quality owing to the amount of sunshine and warmth that it gets during the ripening period.

5443. Is it not in this district that there exists one of the largest maize farms in the world?—There are some large growers. There is one farm belonging to the Transvaal Land Development Company. They have only had the land under cultivation for two years, I think. The first year it was broken up, and last year they put in the seed, but owing to the drought the crop that came was very small. But that land is broken and ready for cultivation, and during the present season I am sure there will be a very big output from those estates. In addition to that there is an area known as the Springbok Flats, which at one time was looked upon as almost a desert, but to-day it is being very largely developed. Its future depends on the amount of water they can find. In some instances water has been found by means of boreholes at a com-

paratively easy depth, in others, again, the water is the condition which means occupation or non-occupation. But that country is also a good pastoral country, and it is being developed as such at the present time. I think that, apart from development along these lines, it will be probably something like double or treble what it was last year. I mean, in addition to the large amount of land under cultivation by white farmers in the Transvaal there is a large amount cultivated by natives.

5444. Can you give me any explanation of this fact, which has been my chief difficulty, and I fancy also the difficulty of most of your visitors, that in a country which, I suppose, is as eminently adapted for the growth of maize as any country in the world, you are one of the greatest importers of bacon and bacon products, and dairy produce? Can you tell me how it is that pig-raising is not connected with maize-growing as it is in other countries, and that dairying is not carried on more where an artificial fodder like maize can be grown so well?—Well, for one thing, we have still to get the full benefit of railway communication, and in this way be able to reach the market easily. Take the milk produce. The milk season is, of course, during the summer months, when the heat is very great. It is largely a question of facilities for handling the milk—co-operative dairying—and it will come in time. There have been attempts made already, but they were rather hastily conceived and not well carried out. But the time is coming when that reproach will disappear. In regard to pigs, it is not so easy to reply. We have had three years of drought, and during those three years it has been difficult to get fresh produce to feed the labourers and stock on the farms, which are of first importance. The pig industry also flourishes better in areas where there is swampy ground, and that we have not got. I think they do better also in colder areas, and the northern districts of this country are too warm. It is favourable for maize cultivation, but not so favourable for the pig. It does fairly well, but it is not too profitable.

5445. But the pig business is developing?—It is capable of development, but I do not think it will ever do so well here on account of the heat and the lack of stretches of low-lying marshy land.

5446. But in climates warmer than this, is it not a fact that the pig does very well?—It may be, but we have not yet come to our own in that respect.

5447. Do you not think as an economic solution of your difficulties that it would be far better as a policy to encourage dairying and pig-raising, which are fairly high-priced products, rather than to encourage the export of maize, which seems to be the policy of the Government? Maize is a bulky article and difficult to transport and has rather an uncertain market abroad, whereas the other products, which in other maize-growing countries are dependent on maize, are valuable and have a certain market?—Well, in normal times we have a big output of maize. We have not hitherto been able to do very well with our pigs, and our dairying industry needs improvement, but I may say that we are moving along those lines now. We have in this area a fair number of good shorthorn cattle, which as time goes on will mean a greatly improved output, and the question of winter feeding is receiving attention. Ensilage pits are being established and the cattle are being fed better in the dry season. The farming methods here have been rather primitive in the past, but we are improving.

5448. But that hardly answers my question. There is a very strong tendency, as a matter of Government action in this country, to encourage the export of maize. Special rates on the railways are granted, special loading facilities provided, and encouragement given in other directions to export this maize from the country where it seems to be so badly needed in the directions I have mentioned, and there does not seem to be the same strong tendency to encourage these other industries which are dependent on maize production very largely, and for which products South Africa is at present dependent on outside markets. Do not you think that the policy should be rather in the direction of encouraging these other industries?—We are dependent entirely on the inhabitants of the country. When they see the policy of doing what you suggest and it is brought home to them effectually, it will follow, but to-day they take what we have, and maize being the product that is in general cultivation the idea of creating a market for that product was the first consideration, but I would say also that the other matters are not being lost sight of. There must be education on the part of our farmers, and that is gradually taking place. But in this country the farmers do not go so much for theoretical education as they do for practical example, and one farmer successfully raising pigs and making butter satisfactorily will set a whole district going on the same lines. That has been done, and is being done to-day.

5449. (**Sir Rider Haggard.**) Drought is a very important factor in all this farming, is it not?—Yes.

5450. During the last three years has it been possible to make grain farming pay on the high veldt?—Yes, in places, but in the back veldt we have done very badly.

5451. Wherever dry farming is possible, has it been possible to make it pay in these years of drought?—I do not think so.

5452. Therefore, in considering this agricultural question you have to bear in mind the possibility of these severe droughts, have you not?—Yes.

5453. Then does it not follow that farming can only be a certainty here where you have the possibility of irrigation. I am speaking now from practical experience?—I think the future of South African farming is in the direction of mixed farming—that is to say, by producing crops to feed your cattle, and by having the cattle as a standby during the time your crops fail or partially fail. They do not altogether fail. We have had instances where a man has had no crops at all, but usually he has enough to feed his stock.

5454. But that is not my question; can farming be looked on as a remunerative certainty except in those districts where there are possibilities of irrigation?—Well, I believe it can be made to pay even with the bad seasons, because when the seasons are normal the results will be sufficient to tide the farmer over the bad time. Two or three good years will mean that it will pay.

5455. You mean that you would not mind investing capital in the face of drought?—We have done it.

5456. And you think it is still payable?—Yes.

5457. What is the average value of agricultural land round here now?—It varies very much. It is exceedingly difficult to say. Take the Springbok Flats, for instance, where the soil is more valuable than in any other country. It is very patchy. There are large areas of very good black soil, approximating to Indian cotton soil, and next to it a chocolate soil, and then again a light red soil which needs fertiliser; they are all good in their way, but differ in value. The value of land, I should say, taking it all round, would be perhaps from 15*s.* to 20*s.* an acre, and for picked spots a little more.

5458. Within a radius of, say, 50 miles of Pretoria?—Yes, I should say so.

5459. Has it risen very much in the late years?—Yes, where development has taken place there has been a considerable advance.

5460. Is dry farming really practicable in the face of severe droughts?—I think so, but not to a man with a small farm of, say, 160 acres like it is in Canada. A man would require, I should say, at least 1,200 acres to have a fair chance of coming out.

5461. That means large capital?—No, I do not know that it does.

5462. To put 1,200 acres under the plough?—No, you would not put 1,200 acres of land under the plough. On a farm of 1,200 acres I should think he would put 200 or 250 acres a year under the plough.

5463. Then you look with confidence on the future of local agriculture?—I do.

5464. You think it is going to be a prosperous business?—Yes, but it is going to take time to develop

5465. And you believe that the reproach to which Mr. Campbell has alluded, namely the importation of all these foodstuffs, will be done away with?—I am

sure of it. The price of butter, for instance, has fallen tremendously from what it was two or three years ago.

5466. But you will remember that during the last forty years it has not been done away with : the conditions are much the same as regards importations as they were forty years ago ?—Yes, but the population has increased very much. I should like to say this also : there are certain facts worth remembering. For instance, in 1870 or thereabouts large quantities of butter were sent down from Wakkerstroom, Heidelberg, and Utrecht districts and sold in Natal, and even shipped to Mauritius and Cape Ports. Later on that production of butter seemed to die out completely ; for what reason I cannot tell, except that they probably found it cost money to produce butter and that it was cheaper to sell the cattle or something of that sort. And then at that time too there was, comparatively speaking, a much larger export of wool than there is to-day. But we are getting back again to a better position in those respects.

5467. But the position is no better than it was ?—I think it is.

5468. Although those exports have died off ?—Yes, I am sure it is. The position has changed. The local consumption is much greater than it was.

5469. Then as regards the future, as far as Pretoria is concerned, do you look upon it as having an agricultural future—as a city that will depend largely for its existence on the primary products of the earth ?—I look upon it as becoming in character—though possibly to a lesser extent in degree—a second Winnipeg. I also believe that the mines which have been already discovered are only the forerunners of those that will follow.

5470. But that is problematical ?—I think the probabilities are in favour of that belief

5471. Has the population of Pretoria grown lately ?—Not lately.

5472. Do you think you can approximate your tobacco to European taste and standard ?—I think it is mainly a question of selection of soil and seed and skill in the manufacture and production of the tobacco

5473. And you hope you will be able to do so ?—I see no reason why we should not.

5474. **(Mr. Sinclair.)** Can you tell us what proportion of a normal crop of maize this district has produced during the last three years ?—We have applied for the figures from the Agricultural Department, and they could not give them to us.

5475. You cannot tell us ?—No.

5476. Which would be the more sensitive to droughts, do you think, maize farming or dairying ?—I think maize production would be the more sensitive.

5477. Then that would be an additional reason, would it not, for directing greater attention to what you have referred to as mixed farming ?—Yes. I may say that not only is maize itself a food and a marketable product, but the stalk is an exceedingly valuable article of food for cattle. When the maize crop has been taken off, the cattle go into the maize fields and eat the dry stalks of the maize, and the product of milk increases very much. As an ensilage plant it is second to none, I suppose. It is a magnificent fodder, and this is only just beginning to be used. It is going to assist wonderfully in establishing dairy farming in this country.

5478. You think that maize farming is more sensitive to drought than dairy farming ?—I think they are both affected, but I think maize is more affected than dairy farming, for this reason. Because even with a failure of the maize crop you may get a sufficient crop to fill your ensilage pits, which would form a very fair proportion of food for your cattle. In that way, of course, it is not so sensitive.

5479. And your belief is that as each year passes, as a result of boring operations, and as a result of dry farming, more will be done to make the farmer less affected by periodical droughts ?—Yes.

5480. Is there much dry farming done in this district ?—It is extending every day.

5481. That is the system of cultivation which preserves the moisture in the soil, so as to lessen dependence on rainfall ?—Yes, and to take every precaution in the way of crops that will make the farmer independent or only partially dependent on the one crop.

5482. And is it extending in your district generally ?—Yes. And there is one phase in regard to dairying more particularly that I would like to mention. In time past, the cattle were entirely dependent on the veldt, and after a period of protracted drought the grass becomes so dry as to be almost useless for fodder, and the cattle in a very dry spring would get into a very poor condition. Dairying suffered materially in consequence of that. Now, with the introduction of ensilage and the gradual increase of it, it means that cattle are kept in better condition, the progeny is more certain, and dairying prospects very materially brightened. But I should also like to say this, that in regard to our farming we are still to a great extent experimenting, and you must not think that we are altogether slow. Look at the progress of Canada : well, it has only progressed and developed during the last twenty-five years. They have only recently found out what they could do with the land there, and we are labouring under the same conditions very much. But as to our future I have no doubt, though we still have a good way to go.

5483. I want to ask one general question ; has not the attraction of gold-mining and diamond-mining in the past put farming generally somewhat in the background ?—It is so, no doubt.

5484. And you will have your great farming industry to fall back upon after the last mine has disappeared ?—Yes, a permanent source of wealth. And in those days it will come to its own.

5485. To the good of the whole Union ?—Yes, anything that tends to the development of one part tends to the development of the whole.

5486. **(Mr. Garnett.)** In answer to Sir Rider Haggard on the subject of irrigation, you said you thought that with irrigation a farmer might hold his own, and that otherwise, after a period of drought he would need two or three years to recuperate. I suppose you would agree that if water conservation were practicable in this district, it would be of great advantage ?—There is no doubt, and we are feeling our way now in regard to that matter. Let me give you an example. On a farm we have been holding for some years we are only now just beginning to use the underground water supplies, but we have to be careful, because we do not know to what extent these supplies exist. At present we are putting, perhaps, 50 or 60 acres under cultivation. I do not know whether Sir Rider Haggard will remember the agricultural conditions of the Zoutpansberg and Waterberg districts in the days he was here, but in those days wheat was sold in Pretoria for something like 10*d.* a bushel, wheat which would equal the finest that the world could produce. If we could have some method of water conservation in the Waterberg district, and that particular area known as the Springbok Flats could be brought under cultivation, there is the prospect of that becoming an immense producer of wheat. But the difficulty is to get the conservation of water. But I do believe that there are large areas in these flats where we can be saved from total drought, and where we can live through the drought and make money in the good years to tide over the lean years. Every pound the farmer makes during the good years helps him to carry over the dry times.

5487. And you have large areas which could be irrigated with an expenditure of money ?—Yes.

5488. By conserving the water that is running away to the sea in flood times ?—Yes. But the rainfall over that area is not very great.

5489. All the greater reason for catching all the water you can ?—Yes.

5490. That will, of course, enable you to grow a number of other crops—stock foods—and so forth ?—Yes.

5491. You are then very greatly in favour of water conservation ?—Yes.

5492. **(Mr. Tatlow.)** Has dairying on co-operative principles established itself here yet ?—It has been tried, but most of those who were interested were inexperienced and went a little too quickly.

5493. Do you believe in that system for helping the development of the country?—I think myself the best system is that which is developed by individual effort—like that of Joseph Baynes in Natal. I think that is where our future lies, and I think that one or two farmers joining together in the marketing of their produce and in the development of the dairy business would do more good than any big schemes. The thing would grow and increase automatically, as it were. But I think that where you attempt to carry on the business on a large scale before trying on a small scale first, you are very likely to fail. It is no use trying to force it, it will develop in the ordinary course of things.

5494. These societies which were established and did not flourish—were they established or assisted by the Government?—I think the Government rendered assistance, but, generally speaking, they were carried out by farmers who took it up on the glowing accounts of the success attained elsewhere. But they forgot that in other places it was a gradual growth. Here they started on a big scale to begin with. That, to my mind, was the secret of their non-success.

Mr. IZAAK JACOB HAARHOFF, J.P., called and examined.

(*For the evidence of this witness on "Land Settlement," "Forests," and "Fruit,"* see *pp.* 45, 301, *and* 319; *and on "Mining,"* see *p.* 33 *of* [*Cd.* 7707].)

5495. **(Chairman.)** What have you to tell us on agricultural development?—There is one point I should like to suggest, if I may, and that is this. Is it not possible for the British Government to arrange with our Government here to take tobacco at a certain price for the Navy? If our farmers knew that they could get 6*d.* a pound for all they could produce it would result in a great development of the tobacco-growing industry. Rustenburg has always had a name for tobacco, and it has been proved that there is no district where you can grow it better, but it can be grown almost anywhere in the Transvaal. Then the bacon question has been touched upon by one of the members of the Commission, and I would like to mention that in the Cape it has been a success, at Wellington. But they have tried the bacon industry in Natal at Nel's Rust farm and they cannot make it a success. I am inclined to think it is the climate, because you can buy ordinary pork to-day here at the same price as in England. The scope is there and if the market was there I think you would get more. Now, in regard to dairying; as far as I remember we have four dairies in the Transvaal, one at Ermelo, one at Middelburg, one at Standerton, and one at Potchefstroom. They are turning out a fair amount of stuff and taking the cream from the farmers. The cans are put on the trains as they pass down the line daily. Even Natal is taking cream from the Transvaal to day.

5496. **(Mr. Sinclair.)** You spoke about tobacco and you expressed the hope that the British Government could be induced to do something. Do you suffer from inability to get markets for the tobacco?—Well, there was a big surplus from the last crop.

5497. Do you suffer from tobacco trusts?—In a sense we do.

5498. You cannot get a market for what you grow under existing conditions?—No.

5499. And it is one of the industries that you believe would largely develop in the future if you could only secure a sufficient market?—Yes.

Mr. JOHN BRUCE MOFFAT, DIRECTOR OF CENSUS, and formerly SECRETARY OF THE ECONOMIC COMMISSION, called and examined.

(*For evidence of this witness on "Statistics,"* see *p.* 128 *of* [*Cd.* 7707].)

The witness had previously been asked whether he could give evidence to the Commission on the following points: The general balance of imports and exports to and from South Africa, with particular reference to the small agricultural production and the large deficit of wheat, milk products, and other articles of consumption which South Africa has to import; the prospects regarding these questions, and the effect on imports and exports of possible diminution of mining production.

In reply the witness furnished the following memorandum:—

To deal adequately with the question of the small agricultural production of the country would require more time than I have had since receipt of the Secretary's letter.

It is only since the war that attention has seriously been given in this country to agriculture as distinguished from pastoral farming.

The census returns for 1911 show considerable development in agriculture since the previous census in 1904. This development is continuing, and although there must be periodical checks owing to bad seasons there is a prospect of production approaching, if not overtaking, consumption.

Lack of facilities for getting produce to markets has discouraged the development of the agricultural resources of the country. This is being gradually remedied by the building of railways throughout the country. Although this country may be able before long to meet the local demand for foodstuffs, it will be many years before it can hope to seriously compete with profit in the world's markets, which are supplied by countries in which agriculture is carried on on a more extensive scale and in which, consequently, the cost of production must be very much lower than it is in this country.

5500. **(Chairman.)** You say that attention has only seriously been devoted in this country to agriculture as distinguished from pastoral farming since the war?—Yes, practically.

5501. And since the war is it within your knowledge that great progress has been made?—Yes, the census return for 1911 shows great development since 1904.

5502. Can you summarise the particular heads under which great progress has been made?—I could give you the figures. In regard to the production of wheat in the Union, in 1911 it was returned at 1,810,000 muids and the figures for 1904 are 708,000.

5503. Have you figures before 1904?—No.

5504. There is no comparison with the years before the war—1898 and 1899?—Well, we might get the 1891 figures from the Cape.

5505. 1904 is starting, of course, from a very low level; is that not so?—Yes, we can give you the figures, I think, for the Cape in 1891, that is the previous census, and the Cape collected statistics between the 1891 census and the war annually.

5506. Will you give us further figures between 1904 and 1911?—Yes; maize was 8,632,516 in 1911 and 3,611,588 in 1904. Potatoes show very little difference.

5507. With regard to the number of animals?—In the Union as a whole, from 1904 cattle increased by 65 per cent.

5508. Can you give the figures?—Well, I have just the figures here. The increase was 2,286,000.

5509. **(Sir Rider Haggard.)** Was that for the Transvaal?—No; for the whole Union. Of course, the country was practically denuded of stock in the war.

5510. **(Chairman.)** Can you give the number now?—Well, in 1911 there were 5,796,000 cattle, and in 1904 3,500,000. As regards sheep, in 1911 there were 30,656,000, and in 1904 there were 16,322,000.

5511. And pigs?—They went from 679,000 to 1,081,000; horses from 449,000 to 719,000; mules decreased from 134,000 to 93,000; donkeys increased from 141,000 to 336,000.

5512. You take the view then that the country will, in the course of a short time, be able to supply its own wants in the way of food-stuffs?—I think it will.

5513. In what period?—That is rather difficult to say, but I should say in ten years' time we should be able to do it.

5514. But you do not anticipate that production will increase to the extent of making this an exporting country?—Ultimately it may; but until agriculture is carried on on a large scale we cannot hope to compete with countries producing large quantities.

5515. What have you to say in regard to this country becoming a meat-exporting centre?—I think it may, possibly.

5516. What proportion of the meat requirements do you now supply?—I think we import about 10,000,000 or 11,000,000 lbs. of meat. That is a comparatively small thing; we cannot give you figures of the actual consumption.

5517. Is your consumption increasing here?—It is very large. People eat a great deal of meat in this country.

5518. But you cannot say whether it is increasing as compared with 1904?—No.

5519. **(Mr. Sinclair.)** At the conclusion of your précis you say it will be many years before this country can hope to seriously compete with profit in the world's markets which are supplied by countries in which agriculture is carried on on a more extensive scale, and in which, consequently, the cost of production must be very much lower than it is in this country?—Yes.

5520. You refer, I take it, to such products as wheat and maize?—Yes.

5521. And the exportation, when the time comes, of sheep's carcases?—Yes.

5522. You do not refer to butter and cheese, which, I suggest, are largely increased in production as large areas are cut up into small farms?—I was not thinking particularly of butter and cheese, but more of wheat and maize.

5523. I have only one further question. You told us when you were referring to the increase of stock that your sheep had nearly doubled in the period which you covered, but you have not exported frozen mutton. You have not exported any of your carcases; you have kept your ship to use on your large areas?—Yes; there have been one or two trial shipments of mutton, but nothing very much.

5524. It has not become a commercial line?— No.

5525. **(Mr. Garnett.)** Can you give us your average production per acre of wheat?—No, but I have the area return.

5526. You have not got the number of bushels?— No; but we have the area return as under wheat, 379,000 morgen. It works out at about 5 muids, or 1,000 lbs. a morgen. A morgen is 2 acres and one-ninth.

5527 **(Sir Rider Haggard.)** Could you give it in bushels?—Well, it could be worked out roughly.

5528. **(Mr. Garnett.)** There are 60 lbs. to a bushel?—There are 3 bushels to a muid, and the production is 1,810,000 muids. That is, roughly, 5 muids to a morgen, that would be 7½ bushels to the acre.

5529. Well, that is lower than other figures which we have had put before us in this country.

5530. **(Sir Rider Haggard.)** That is lower than in Australia?—Of course, I do not know whether these figures of areas under cultivation can be absolutely relied upon.

5531. **(Mr. Garnett.)** The reason I put the question to you is this—You do not think you would be able to export, but from other figures we have had it seemed that your figures of production were considerably greater than for other countries which exported wheat?—I cannot say definitely what the production per acre is.

5532. **(Sir Rider Haggard.)** We should be glad if you could let us have figures?—I started to work it out in the different districts but the results varied so considerably that the figures were evidently wrong.

5533. **(Sir Alfred Bateman.)** Those figures are not very reliable, are they?—No, I do not think so, but we are proposing to collect statistics of agriculture by the department very soon.

5534. **(Mr. Garnett.)** I submit that this has a very important bearing on the question?—Yes.

5535. **(Chairman.)** Well, you might give us what you can, will you?—Yes.*

5536. **(Mr. Tatlow.)** You say that lack of facilities for getting produce to market has discouraged the development of the agricultural resources of the country. Has that lack of facilities been serious? Does railway construction lag seriously behind the agricultural industry?—It did up till ten years ago.

5537. Is it doing better now?—Yes, the railways are extending. For instance, there is one area in the north-west of the Cape Province which promises to be an excellent source of wheat supply. They were 230 miles from the railway, but they are now building a railway to that part.

5538. You spoke of the difficulties of this country competing in the world's markets for agricultural produce. In that matter do you not think that this country has a great advantage over other countries in the matter of cheap labour?—Well, people say we have cheap labour, but I do not think it is cheap.

5539. Do you not think it is cheap as compared with Australia and New Zealand?—No, you certainly pay less for it, but it is not so good. I think it is a mistake to talk about farmers having cheap labour.

* The witness subsequently furnished returns of agricultural produce and live stock for the Cape and Orange Free State Provinces, printed as Appendix IV., p. 271.

Pretoria, Tuesday, 31st March 1914.

Mr. CHARLES ELIAS GRAY, M.R.C.V.S., Principal Veterinary Surgeon, Department of Agriculture, Union of South Africa, called and examined.

5540. **(Chairman.)** Will you give us a brief statement on the subject of the success which you have met with in eradicating the various animal diseases in the Union?—In regard to that I must say we have met with a very considerable measure of success since the Department was first established.

5541. That is four years?—No, ten years. It will be understood, of course, that so far as animal diseases are concerned you may sub-divide them into two classes, that is one class with respect to which we know the method of spread, and another class in regard to which we are not fully advised and about which investigations are still taking place. Well, as far as the diseases are concerned that we know about and understand the methods of spread, the outlook is very satisfactory. That class of disease has been handed over to the Administrative Division of which I am the head. On the other hand in regard to diseases whose causes have not been definitely made out, they are at present engaging the attention of the research division of which Sir A. Theiler is the head. Now the Administrative Division is called upon to administer a Stock Diseases Act, under which certain very important diseases are scheduled. With those diseases we have been, I think I may say, very successful, and have made very satisfactory progress indeed. Perhaps the most important which we have been called upon to deal with has been the East Coast fever, that is the tick-communicated disease introduced into this country about eleven years ago. When it first came in we were not acquainted with its method of spread and we did not quite know how to combat the disease, but investigations which were made pointed the way out of our difficulties, and in following out the policy which has been adopted in that direction, and which was based upon our knowledge of the disease, we have been very successful indeed. I have prepared a short statement here showing what has been done in the Transvaal.

I have been in charge, I may say, of this division, the Administrative Division, since 1905. When I came down here a very large section of the Transvaal was invaded with East Coast fever. That disease is a very difficult one to deal with on account of the long period during which infected areas retain the infection. They remain infected for fifteen months, and fifteen months' quarantine is necessary before we can be satisfied that the place is clean. At first we dealt with it by killing off the infected herds, compensating the owners, and fencing. Later on it was discovered that the disease could be satisfactorily combated by the erection of dipping tanks and frequently dipping the animals in order to free them from the ticks, and as our discoveries proceeded we altered our policy to fit in with the results of our investigations. In 1904 in the Transvaal, and I refer specially to the Transvaal now, because I can give you the best idea of the condition of things in this Province, we had 400 outbreaks of this disease, over 14,000 animals died. But that is an estimate which is very much under the real figures. In 1905 we had 214 outbreaks. In 1906 we had 98. In 1907 we had 63. In 1908 we had 142. In 1909 we had 104. In 1910 we had 131. In 1911 we had 45. In 1912 we had 25, and the country is now being rapidly cleaned out, because while these outbreaks are diminishing we have been able to release farms from quarantine and open up the country for the movement of stock. I have also prepared a short statement showing what has taken place in other parts of the Union since the various departments were amalgamated, but I cannot go so far back as I can in respect to the Transvaal. The area which is most seriously affected by the East Coast fever at the present time is the native territory of Transkei. That country is pretty well invaded by the disease, but steps are now being taken there to erect dipping tanks and to fight this disease and we expect ultimately to be able to eradicate it even there. The disease has also invaded the Cape Province, but the fight which has been put up in the Cape Province has been so strenuous that the disease has made no headway and we are stamping it out in that Province. In the Province of Natal the position, of course, is not altogether satisfactory yet, but a very large number of dipping tanks have been erected by the farmers in that Province, something like 1,300 to 1,400 altogether, and the Government in addition to that are erecting dipping tanks in the native locations and the native areas and fighting the disease in those localities by means of this system of dipping, so that the position even in Natal is also rapidly improving, and the outlook in that direction is quite satisfactory under the circumstances. After this, perhaps the most important disease, or at least the one that is giving us cause for most anxiety at the present moment, is tuberculosis. We have not yet got a great deal of tuberculosis in this country, so far as our information goes, but our information is not very full or complete. The area in which we know most about the disease perhaps is the Cape Peninsula, where a considerable amount of testing of dairy herds has been carried out. There we have tested, I may say, over 17,000 head of cattle, and in that 17,000 head of cattle, I think we found about 3·7 per cent. of the animals tested had proved to be infected with tuberculosis, which is a very satisfactory state of affairs so far as it goes, when you compare that with the position in Europe, where at least 30 per cent. of the cattle are said to be affected. Take Great Britain, for instance, you can say without hesitation that at least 30 per cent. of the cattle in Great Britain are infected with tuberculosis at the present time. Therefore, I think, it is not too late yet for us to take still more vigorous action and more vigorous steps in connection with the eradication of this disease. We test all imported animals in order to make sure that we are not getting any infected animals brought into the Union from over sea, but we find a certain proportion of them are infected although that proportion is a comparatively small one. Most of the people who import stock from over sea at the present time take the precaution to have them tested before bringing them out, but I may here mention that it is possible for the animals to be fortified against the test and it takes some considerable time for the immunity conferred by fortification to wear off. Therefore, there is no doubt that although we find infected animals are brought here from over-sea, which animals have been tested on the other side, it does not reflect on the good faith of the people who have carried out the test at home, and it may be regarded as evidence of the fact that in some cases, at all events, the animals have been tampered with before the test, or that the animals had been in the initial stages of the disease, and the disease was not sufficiently developed to enable the animals to react to the test. Then I may also say in regard to tuberculosis, there is one interesting fact that has been brought to our notice in the last year or two, and that is this, that the disease is not confined to cattle in this country alone, but we also get it amongst pigs. A fair number of pigs have been found to be affected by tuberculosis when sent to the Johannesburg abattoir. It has been a matter of conjecture as to how these animals originally became affected and we have made inquiries to ascertain the probable cause of the infection and what we have found out is this, and it is an interesting point, that these pigs very largely come from native territories, and not only is that the case, but the strain of infection that we get amongst these pigs is of human origin. As you may be aware there are two strains of the organism that causes tuberculosis, the human strain and the bovine strain. Now, these pigs that have come from native territories, in many cases, though not in all, have been proved to be infected with the human strain and the reason for that has been attributed to the scavenging habits of these pigs, which have become infected from natives who have contracted tuberculosis.

5542. Do you mean corpses?—No, they scavenge round the kraals, and become infected by means of expectoration, and so on. Now, passing on from tuberculosis—a disease that is causing us a great deal of anxiety is anthrax. There is no doubt that it is increasing in this country to a very considerable extent. Our records since the war show that anthrax has increased very considerably. I will give the figures in regard to anthrax which have been recorded in the Transvaal since 1904. In 1904 we had three outbreaks, but this small figure may have been partly due to neglect on the part of the farmers to report outbreaks of the disease. In 1905 we had 11. In 1906 we had 10. In 1907 we had 9. In 1908 we had 13. In 1909 we had 17. In 1910 we had 57. In 1911 we had 68. In 1912 we had 104. There is no doubt that this increase in the prevalence of anthrax is largely due to a want of care displayed by farmers in disposing of infected carcases. We have published warnings, we have issued circulars describing the disease, we have communicated with the Press, but in spite of all these steps there is still a great lack of care on the part of farmers in disposing of the carcases of animals that have died of anthrax. It follows that the disease will undoubtedly become more prevalent in those areas in which odd cases have occurred, and it is giving us cause for considerable concern at the present time. There is a disease called gall lamziekte, which is prevalent in the South West Transvaal and adjacent districts. There, I am sure, it is the custom with many of the farmers to put down all deaths of animals to this so-called gall lamziekte, which is not contagious in the ordinary sense of the word, and the consequence is that if an animal dies from anthrax, it is very often cut up and carried away and skinned, on the assumption that it died from gall lamziekte, and the veldt in that area then becomes infected. Of course, the disease can be checked by inoculation, and we are carrying out a considerable amount of anthrax inoculation at the present time. But the number of people who comprehend the benefits derived from inoculation compared with the number of people who are careless in handling outbreaks is very small. The next in importance, perhaps, as far as this Division is concerned, is glanders. Glanders is a disease of horses communicable to human beings, and it was very prevalent in this country after the war, but since then it has been steadily diminishing. In 1904 we had 158 outbreaks

and they have now dwindled down to 40 in 1912 in the Transvaal. The position now is more satisfactory. Next comes lung sickness, or pleuro-pneumonia, which is a disease known and recognised in Europe as well as here, and was very prevalent in this country after the war, but the measures which have been taken in order to control it and stamp it out have been very satisfactory. In 1904 in the Transvaal we had 256 outbreaks, and in 1912 we had only 7, so that, generally speaking, all along the line I think we can claim that, in respect to proclaimed diseases, we are making very satisfactory progress. Of course, our work is not confined to this, we have other work to do, and we are carrying out a considerable amount of horse inoculation at the present time by means of serum, for the protection of animals against horse-sickness, both mules and horses. This serum has been prepared at the research laboratory for some time, and the immunisation of the animals in the field is work carried out by officers of the Administrative Department. During 1912 we inoculated a very considerable number of horses, nearly 500, with very satisfactory results, but the mortality was something like 12 per cent. resulting from the inoculation. This is not as satisfactory as we could wish, and endeavours are being made by the research division to improve the quality of the serum and reduce the death-rate, that is, for horses. In the case of mules we have for some years past succeeded in immunising them with very satisfactory results indeed. The percentage of mortality, as far as mules is concerned, is considerably less than in regard to horses. The figure is about 4 per cent. Generally speaking, the results have been all that one could wish, and this inoculation, of course, has been of the greatest assistance to European farmers living in horse-sickness areas. I do not want to take up your time unduly, or I could go into further details. I do not know whether there are any other points which I can emphasise, but if you care to ask me any questions, I shall be pleased to answer them.

5543. **(Sir Jan Langerman.)** There is one question. You spoke about tuberculosis in pigs and you traced it back to the Kaffir kraal. Presumably those are Kaffirs suffering from phthisis. How do you connect phthisis with tuberculosis, they are quite different?—No, they are due to the same causes, the same organism.

5544. But it is not the same disease?—Yes, it is.

5545. On the mines a man suffering from phthisis is not regarded as suffering from tuberculosis at all?—Yes, he is.

5546. No, because they make a distinction as to compensation?—They may do so, but the cause is the same in both cases, it is the same organism.

5547. It attacks the same organ, that is true, but is it the same disease?—Yes. Phthisis is a condition in which the lungs are invaded by the specific organism of the disease, that is tuberculosis. Of course you may have general tuberculosis of any organ in the body, that is the only difference however.

5548. How far have you gone in dealing with gall lamziekte?—That is engaging the attention of the research division to-day. They have been working on it now for the past ten years. It is a disease that has caused very heavy mortality, principally in the western parts of the Transvaal, in Bechuanaland, and in some parts of the Cape Province and it has baffled all researches up to date and all investigations. The only evidence that we have been able to find which points to the probable cause has been these experiments which we made some time ago. The disease is believed to be due to dietetic causes, probably some deficiency of nutrition in the food. Experiments were made some time ago by the research division with 100 head of cattle. Fifty head were taken to a farm in which this disease was very prevalent. They were muzzled and put on the veldt and allowed to run with the other 50 which were unmuzzled, the muzzled ones being fed at night. But all these animals ran together and drank out of the same pools. The consequence was that out of the animals that were unmuzzled something like eight head contracted the disease, but of the muzzled animals not a single one got the disease. Now that is rather significant and it rather points to the fact that the disease is dietetic.

5549. Is it a fact that the disease is travelling eastward?—I do not think it is. I think the incidence of the disease depends considerably upon the climate, it is due to climatic conditions. The prevalence of drought and the succession of droughts seems to favour the appearance of the disease, there is no doubt about that, I think. If you have a very dry year you are likely to get a good deal of it. We have had a succession of dry years of late and the condition has throughout been aggravated, and we consequently hear more about the disease than we did a few years ago, but I do not think it is invading new areas at all.

5550. **(Mr. Garnett.)** I would like to ask if this disease could be described to us. What are its symptoms?—It is a peculiar disease and it attacks to a very large extent cows in calf and cows that have recently calved, although it is not confined to them. You get two types of the disease: the acute form, in which the animal may appear to be in good health the night before and the next day will be dead; or you may get the chronic type, in which animals may linger for months and may ultimately recover and afterwards get a second attack and then die. The symptoms of the disease are peculiar to South Africa, as far as I know. The chief symptom is disordered locomotion, the animal is stiff in its movements, it lies down with great difficulty, and when it does lie down, although it may eat and appear to be in good health, it shows a disinclination to get up, and ultimately the limbs become more or less paralysed. They lose the power of motion, and this paralysis extends to the general muscular system, until finally the animal dies. So far as I know it is confined to South Africa and it has been very prevalent during the past few years in certain parts of the country, so much so that people have had to give up cattle-farming altogether. You can well understand that if cows, after they have calved recently are victims of this disease, there is very little hope for stock farmers doing anything on farms where the disease is prevalent.

5551. **(Sir Alfred Bateman.)** Are you in communication with the Board of Agriculture at home?—Yes.

5552. Do you derive any benefit from their experience?—Yes, we follow their work very closely and I may just mention that the Principal Veterinary Officer of the Board of Agriculture at the present time was my predecessor here in the Transvaal, and so naturally we are very much in touch with one another.

5553. And are you in communication with the Imperial Institute in London?—No, not to any great extent.

5554. I thought they were of use some time ago in finding out something in connection with a certain plant which you sent to them for investigation?—Yes, but it did not go through us. They do carry out investigations in regard to poisonous plants. We collect the material and send it home.

5555. But you would not know the result?—Yes, they generally advise us of the result.

5556. **(Mr. Sinclair.)** Generally speaking, you think that satisfactory progress has been made in the treatment of the various diseases you have spoken of?—Yes, I am satisfied of that.

5557. You spoke of anthrax being one disease which has caused you considerable trouble. Now, are there public abattoirs in the various districts, I mean licensed abattoirs?—Only in the large towns. In some of the towns they are exceedingly good. The one in Johannesburg, for instance, would compare favourably with any abattoir in Europe, but in other parts of the country the arrangements for the slaughter of animals are very primitive.

5558. And is there any systematic inspection of animals slaughtered at these abattoirs?—No.

5559. **(Mr. Garnett.)** Could you just tell us as shortly as possible what are your dipping arrangements. We have had some difficulty in finding out whether the dipping system is compulsory everywhere, or whether it is more or less permissive, that is, whether certain areas can be proclaimed as dipping areas or whether it is compulsory all over the Union?—What we do is

this : we preach the doctrine of dipping to all farmers, and urge them to go in for it not only for the purpose of protecting the stock against East Coast fever, but also to protect it against other diseases as well. When an outbreak occurs on a farm we have legal power, which we exercise, to order compulsory dipping on that farm, and we compel the owner to put up a tank. That is the power we exercise so far as the districts are concerned which are infected. In other districts we try to get the majority of the farmers on our side and get them to ask for compulsory dipping. It is very often the case that in a district where East Coast fever is prevalent the farmers ask for compulsory dipping.

5560. Then at the present time it is more or less permissive ?—Yes, it is more or less permissive.

5561. It is not by universal application ?—No.

5562. Then it is some time before you may expect to eradicate the tick ?—Yes.

5563. Do you say that these regulations are being made applicable to the native territories in Transkei ? —Yes, they are.

5564. To return to this question of testing imported stock to find out if they are suffering from tuberculosis, I just want to ask one question about the doping. I gather from you that it is quite possible for a veterinary surgeon to give a certificate that the beast is free from tuberculosis in absolutely good faith ?—Yes.

5565. There might possibly be collusion, but it does not necessarily follow that there is ?—Quite so.

5566. The most perfect *bona fides* might be exercised, and yet a man might give a certificate that the beast was not infected when it actually was ?—Yes. I know one or two men at home who specialise in the testing of animals, and who are absolutely above suspicion of anything of the kind, and yet it is possible for them to pass animals which are suffering from tuberculosis.

5567. In regard to this dipping again, do you find much opposition on the part of the natives to the dipping system ?—No, they are very teachable. In the Zoutpansburg district I may say that the natives have even gone to the extent of paying up the money themselves to erect the necessary dipping tanks. They simply want to be led. If they have a good Native Commissioner in whom they have confidence, they will take up these things themselves. There are cases that I know of where they have actually clubbed together to put up a tank.

5568. Then there is no danger of those areas being kept as sanctuaries for the breeding of ticks ?—No.

5569. What you said about ticks and tuberculosis was very interesting, and we have had it stated in evidence that tuberculosis is increasing among the natives. Now, without going into the question as to whether bovine tuberculosis is communicable to man, have any researches been made into the question of porcine tuberculosis as to whether it is communicable to human beings ?—I think the risk is very small in that respect, because when you get a pig infected with a human strain of tuberculosis bacillus the lesions are of a very limited character, and they are more or less localised, and the chances of people getting the disease in that way would be very very small. Why I mentioned the thing was this—the gentleman who gave evidence before me remarked on the way in which tuberculosis was spreading among the natives, and I brought out that fact as evidence in support of his contention.

5570. All I wanted to know was whether tuberculosis among pigs came from human beings, or whether it was worked backwards, and human beings were contracting it from pigs ?—I should say, No.

5571. Now, you have had serious outbreaks of anthrax, you say ?—Yes.

5572. Among sheep and cattle ? — Mainly among cattle. In some places horses have been affected, in the Kimberley district, for instance.

5573. But you have had no complaint of anthrax being present in your wool shipments ?—No, not to any extent.

5574. Has it been reported ?—No.

5575. What regulations have you in regard to the disposal of carcases of infected animals ? Have you regulations prescribing that they shall be consumed by fire or buried in quick lime ?—They have to be disposed of according to the instructions of the Chief Veterinary Surgeon. If they are not burned they must be buried at least 6 feet down, preferably in quick lime, in places where water is not likely to be contaminated.

5576. Have you had many fatal cases among human beings ?—Yes, undoubtedly there have been some. We have had cases among the natives, but they are not always fatal. We often get cases among the natives because they are very careless, particularly along the Reef. Along the Witwatersrand the local conditions are such that the spread of the disease is favoured. If an animal dies, sanitary fees have to be paid for the removal of the carcase, and many owners of a single animal or one or two beasts, if they die out on the veldt and the thing is reported to them, do not claim the animal, in order to evade payment of sanitary fees, and the consequence is that very soon the natives come out of the nearest compound and carve the animal up and carry it away. Of course, these conditions favour the spread of the disease very much.

5577. You gave us figures of 104 outbreaks. In which year was that ?—That was in 1913.

5578. How does this year compare ?—I think it will work out just as high.

5579. Then you have not got control over the disease yet. You have not really grappled with it sufficiently ?—No, because we have not been able to impress upon the farming community the serious nature of the disease.

5580. (**Sir Rider Haggard.**) This anthrax is also found among ostriches ; is it not ?—Yes, it has been discovered in the Grahamstown District among ostriches. Formerly it was supposed that birds, on account of their high temperature, were not susceptible to the disease, but cases are on record in the Grahamstown District in which ostriches have died from anthrax, but it is not usual.

5581. Is the ostrich anthrax communicable to cattle ? —Undoubtedly, it is the same organism.

5582. Because I have been told of a case in which many ostriches were found to be suffering from this disease. In this instance I was informed that the strange thing was that cattle running with those ostriches were not affected ?—Well, the farmer must have been rather careful in disposing of the carcases perhaps, but the same disease is transmissible to human beings, to cattle, to sheep, and to ostriches.

5583. This dipping system appears to be the great specific for many ailments that we used to have in South Africa in former times, and especially for East Coast fever. Is there any disease that is not amenable to dipping ?—Yes, it would not have any effect upon lung sickness, for instance, it would not have any effect on rinderpest nor on foot and mouth disease, nor on gall lamziekte, nor on anthrax, nor yet upon horse-sickness.

5584. But there are people dipping for horse-sickness, are there not ?—Yes, there are, but it has not yet been shown that it is beneficial. Some people believe it is, but it has not been satisfactorily demonstrated. And then again there is the fly disease, the disease caused by the tsetse fly. I very much doubt if dipping would be a preventive of that.

5585. So there are still a good number of diseases for which dipping is no remedy, especially lung disease ? —Yes, those you cannot fight by dipping.

5586. Is lung sickness as prevalent as it used to be ?—Not nearly as prevalent, we have very very few outbreaks now, even in the Bechuanaland district where it used to be so prevalent.

5587. But dipping has materially altered the situation as regards stock farming ?—Yes, there are a good many diseases for which dipping is a satisfactory remedy. For instance, what we used to call gall sickness and bush sickness, red-water, and East Coast fever—there is no doubt that all those diseases can be met satisfactorily by dipping.

5588. And the rest can be kept off by isolation ?— Yes, and by proper sanitary measures.

5589. And by paddocks ?—Yes.

5590. Speaking generally as regards animals, you would say the outlook for agriculture in the Union of

South Africa is better than it has ever been before?—I should say so.

5591. To a marked degree?—Yes.

5592. Have you an adequate number of veterinary surgeons in private practice here?—Very few.

5593. Is there work for more?—Yes, there is.

5594. Remunerative work?—Well, that is an open question; I am not so sure about that, but there is lots of work we could do with a larger Government staff than we have at the present time. It is certainly not big enough.

5595. **(Mr. Garnett.)** Just one more question. I understand you are the Principal Veterinary Surgeon of the Union?—I am.

5596. When I was in the neighbourhood of East London a short time ago I had occasion to visit a farm, and on the way I passed through some country that seemed to be excellent pastoral country, rich downs, and yet it was almost bare of stock. On inquiring the reason, I was told that the tick had driven everything away, but now since they have applied this dipping system they expect that the country will once more become a good pastoral country?—Yes.

5597. There are a few cattle there, about 200, and they seemed to be in very good condition?—Yes. Of course, in the East London district we have this disease of East Coast fever very bad, and that has caused a great deal of trouble down there, and it has hampered very largely the development of this fine pastoral country. Another thing which has also had a very serious effect on the development of that district has been the prevalence of heart-water among sheep. That disease is also contracted by a tick known as the bont tick, because of the fact that it is spotted on the back. Well, by dipping you can get rid of that tick, and after you have got rid of the tick you can re-stock these farms.

5598. The general result then will be to bring in vast areas of country that are at present unsuitable, or that have been unsuitable in the past for pastoral farming?—Yes, particularly the coastal areas, which are extremely well suited for the breeding and raising of dairy stock, and in many places for sheep.

5599. **(Chairman.)** You will send the Commission a statement in regard to tuberculosis and doping?—Yes.*

* *Note.*—The witness subsequently supplied the following statement:—

I wish to make it clear that I do not believe it is customary for British breeders of good repute to fortify their cattle with tuberculin in order to enable infected animals to withstand the tuberculin test applied in Great Britain as a usual preliminary to export; nor do I suspect there is any collusion between such breeders and the professional men who are employed to furnish certificates as to the freedom of the animals from disease in such instances. At the same time we find, on re-applying the tuberculin test one month after imported animals have landed in this country, that a certain number of cattle do react to the test (19 out of 557 tested within a period of 15 months), and although the circumstance that they have not reacted when previously tested in Great Britain may be explained in some instances by the assumption that the disease was in its incubative stage on the occasion of the first test, post-mortems made, in some instances, certainly warrant our coming to the conclusion that their failure to react cannot be attributed to that cause, and may, and probably are, due to the fortification of the animals with tuberculin as a preliminary to the original application of the test made before shipment.

Pretoria, Wednesday, April 1st, 1914.

Mr. Alfred George Robertson, Mr. W. A. Pilkington, Mr. F. R. N. Findlay, Major Richard Dines Doyle, D.S.O., Mr. J. L. Van Heerden, and Mr. T. Kleinenberg, representing the Transvaal Agricultural Union, called and examined.

5599*a*. **(Sir Alfred Bateman.)** I am very pleased to see you although it is now the eleventh hour, and to hear your views on the points you have submitted. I wish we could have had your memorandum earlier, but we have only just this moment received it, and none of us have had time to read it, and some of the members have left for Johannesburg already, including the Chairman.

The following is the memorandum referred to:—

(The portions relating to "Irrigation," to "Cotton," and to "Fruit" are printed on pages 52, 286 *and* 320.)

Cattle.

There can be no doubt that within the past few years considerable improvement has taken place in the quality of the cattle which are being kept by progressive farmers, and there is likely to be further improvement in the near future. This state of affairs is very largely owing to the enlightened policy which has been followed by the Agricultural Department of the Transvaal, in placing specimens of various imported breeds in the Agricultural Shows, which are becoming more and more popular throughout the Province. The most common of foreign breeds are, in the order of their numbers, as follows: Friesland, Shorthorn, Ayrshire, Devon, Hereford, and one or two other breeds such as Jerseys, Polled Angus, Sussex, &c. The Africander cattle, indigenous to the country, are largely owned by the Boers, and the recent attempts to secure purity of breed have done much to increase the popularity of this useful class of animal. There is still a very common tendency among the less progressive farmers to resort to the use of nondescript sires, a practice which cannot be too strongly deprecated. At present it is largely a matter of conjecture as to the breeds which are most suitable for our widely varying district conditions, and experiments should be continued in order to assist the stock farmers of the country. It will be seen from the list of breeds which are given above that the farmers are bent on producing those articles such as milk, butter, cheese and meat, which are so largely in demand throughout the Province.

A question which deserves the most careful consideration at the present juncture is whether expensive dairies can be made to pay while the quality of our cattle remains, on the whole, what it is to-day. It would appear that to answer this question in the affirmative would require an amount of faith above the ordinary, especially in view of the fate which has befallen every co-operative dairy which has so far been established in the Transvaal. Many of those who have been once bitten are too shy to again venture their money in such undertakings.

Another question which needs the most careful consideration is that of the position of the respectable white dairyman over against his unprincipled competitor for the milk trade of our larger towns. Individual witnesses will be able to throw considerable light on this problem. Suffice it to say here that the methods which are adopted by those who are fast capturing the fresh milk trade of our towns are such as would serve to land those who practise them in prison in ordinary civilised countries of the world. Not only do such things happen, but there is also the terrible danger which is daily being run, that the milk of tuberculous cows may be supplied to those who are predisposed to lung troubles. This applies especially to mining areas. Against these practices and these dangers the honest dairyman is absolutely powerless. It is true that there are reports to the effect that steps are now being taken to deal with tuberculosis, and to pay compensation for animals which it is found necessary to destroy, but the prospect is not encouraging when an animal worth 35*l*. to the owner is liable to bring only 5*l*. as compensation. It is

greatly to be desired that the law at present being dealt with by the Provincial Council will make provision whereby this matter will be placed on a satisfactory basis. It will be shown later on in this statement that the removal of stock inspectors from our borders has resulted in the increase of the spread of contagious stock diseases.

Stock Diseases.

Returning to the question of cattle in general, it is sufficient to mention such diseases as gall sickness, redwater, East Coast fever, and last, but by no means least, the disease which the Boers have named lam-galziekte. The three first-named are sufficiently well known, but the last-named is a disease which is gaining ground in certain districts of the Transvaal and the Orange Free State at an alarming rate. It appears to consist of a combination of gall sickness and paralysis, the cause of which appears, up to the present, to remain undiscovered. It has been responsible for the deaths of thousands of cattle, and so far no preventive or remedy has been found. That a sickness of this nature demands the immediate attention of the authorities in regard to the making of experiments is a fact too obvious to need demonstration. Dr. Theiler has, within the past few days, met the farmers of the districts most concerned, and is now engaged in such investigation work as, it is hoped, will result in the discovery of the cause of the disease and its prevention in the future.

Horses.

As is well known, the class of horse usually bred in the Transvaal is that which is known under the name of the "Boer paard"—a most useful horse for riding purposes, capable of carrying heavy weights, full of endurance, and for the purpose of pulling in the ordinary Cape cart of the country probably unequalled by any other horse of his size; he is still not an animal which would find a ready market outside the circle of those who know his actual worth. In this direction there is a great need for the giving of advice to many of those who are engaged in the breeding of horses. The Transvaal Agricultural Union hopes, in conjunction with the Imperial Remount Department, to be in a position to hold meetings of horse-breeders in various centres, with a view to giving information to those who propose to avail themselves of a more profitable market than that for which they now cater. It is a pleasure to be able to state that many of the leading farmers of the Province are bestirring themselves in the direction of improving the quality and the size of their stock. This movement is one which has received a considerable impetus from the mining men of Johannesburg, who, in many instances, have interested themselves most keenly in farming matters, and who have introduced many most valuable sires into the country. The Agricultural Department has also assisted in this direction, but there seems to be a very general feeling that the whole question has not been studied with sufficient care, and that many useless sires have been introduced. It is absolutely necessary that steps should be taken for the production of only such animals as will find a ready sale at paying prices, and to this end investigations should be set on foot so as to discover the best course to follow for the securing of that end. There is also the question of the class of mare which should be employed for the production of a saleable remount. Through the influence of the General Officer Commanding, Lord Methuen, an arrangement was entered into with the Remount Department by our Union by means of which cast military mares, free from hereditary disease, and considered suitable for breeding remounts, could be distributed to horse-breeders interested in this matter. The price was fixed at 20*l.* each, but, at the last distribution, a few months ago, another system was adopted, whereby the prices are fixed for individual animals, and vary from 18*l.* to 26*l.* each. It is questionable whether this method will not defeat the object in view. Some farmers who have had such mares have found them breed readily, especially where artificial insemination has been resorted to. It is quite certain that the military authorities will find no other country where a more hardy horse can be produced, and, with Dr. Theiler's triumph over the long-dreaded disease known as horse-sickness, the way is open for a considerable advance on past accomplishments.

Heavier Horses required.

It is very probable that a heavier class of horse will, within the near future, become a valuable economic factor in the life of the farm, particularly as smaller holdings become more common. It stands to reason that, with modern methods of cultivation, the soil of the cultivated portions of the country will attain to such a state of tilth that it will no longer pay to use a long span of oxen, on comparatively small areas of land, in the cultivation of crops, and that a single horse of powerful build will be employed with a view both to neatness and despatch. It is also certain that many districts which have up to the present remained unused by horse-breeders will in the immediate future be employed for the raising of such stock, seeing that horse-sickness need no longer be feared. As many of these districts are largely impregnated with lime, their value will become greater for the production of a class of animal with plenty of strong and closely knit bone. In the meantime it behoves the Government, especially with a view to the establishment of a defence force in South Africa, to use every endeavour to assist this important industry.

Sheep.

Sheep have increased most rapidly in numbers since the close of the war, and this may be regarded as a proof of the wonderful recuperative properties of the Transvaal. It may safely be asserted that not 75 per cent. of the owners of sheep take even ordinary care of their flocks. Generally speaking, they are a mixture of Cape, Bastard, Persian, and Merino breeds, except on the high veld, where several flocks of pure Merinoes may be seen. It is a most common thing to find goats of various kinds mixed with the sheep, and few farmers possess the necessary knowledge to enable them to select, from their flocks, the ewes which, crossed with suitable rams, would tend to improve their quality. There are very few of the ordinary European breeds which are found in England and the Australian Colonies, such as Shropshires, Southdowns, Leicesters, &c., to be found in the Transvaal. This means that even the best sheep farmers are devoting their attention exclusively to the growing of wool, for which the merino is famous, and that but little is done to provide a good quality of mutton, even for the local markets. The average value of the wool is a low one, but there are many outstanding exceptions where the quality is such as to produce much higher prices. A very large quantity of mutton is annually imported into the Transvaal, all of which should, within a reasonable time, be locally produced, and of a quality much superior to that which is now inflicted on the long-suffering consumer. The prices paid by the butchers, compared with the prices paid by the consumers, appear to leave a considerable margin in favour of the former class and the cold storage companies who supply them with frozen mutton; perhaps the farmers will awake to the possibilities which exist for co-operation among themselves, in order to secure better prices for their livestock. Much has been done by the sheep experts who have been employed by the late Government of the Transvaal in the direction of assisting farmers to work upon modern lines, but if the services of the Transvaal experts are to be divided among the four Provinces of the Union, it does not appear that their opportunities for the continuation of their useful work will be very great. It is only as the ordinary farmer is brought to see that his success in sheep farming, as in everything else, depends upon the intelligence, energy, and personal effort which he puts into his work, that we can hope to see any general improvements in the conditions which now prevail.

Pretoria, 1 *April* 1914.] Messrs. A. G. Robertson, W. A. Pilkington, F. R. N. Findlay, Major R. Doyle, D.S.O., J. L. Van Heerden, and T. Kleinenberg. [*Natural Resources: Animal and Agricultural Produce.*

Pigs.

The pig is, unfortunately, generally regarded as a despised adjunct of the ordinary farm, while we continue to import large quantities of hams and bacon into the Transvaal from foreign countries. In 1909, the latest date for which separate figures are available, the value of bacon, hams, and lard imported into this country was 117,324*l*., and there is no apparent reason to lead us to suppose that later years have seen any diminution in this amount. This a most regrettable fact, when it is remembered that every penny of this large amount might have been spent in purchasing local products. Several imported breeds of pigs have been introduced, and some of the progressive farmers are devoting their attention to the curing of hams and bacon. It does seem strange that, with the high prices commanded by these commodities, we should ship our mealies to Europe instead of sending some of them to market on four legs, and at a greater profit. There is another point in favour of the pig, and that is that he is much less liable to disease than most other varieties of livestock found in the Transvaal. It may be interesting to note that the value of the bacon and hams exported from the United States of America to other countries amounts to no less a sum than 86,000,000*l*. annually. Perhaps the pig may yet come by his own in the Transvaal.

Poultry.

Some improvement has taken place, in recent years, in connection with this branch of the farming industry, and many of the most valuable breeds have been introduced into the country. Unfortunately, these are mainly kept by fanciers in or near towns and by only a few of the most progressive farmers. Yet it would appear that there is a possibility of making a considerable profit out of poultry, if the business were intelligently undertaken.

Maize.

Maize ranks highest in importance among the varieties of grain which are produced in this Province, and is grown to a greater or less extent by nearly every farmer in the country. It is certain that the conditions of soil and climate in many parts of the Transvaal lend themselves to the production of a quality of maize which cannot be excelled in any other part of the world. The methods which are generally adopted leave much to be desired, and it will require a long time to convince the average farmer that the success of his crop depends on everything which is done from the breaking of the soil to the harvesting of the grain. To roughly plough an area of ground, throw around an uncertain quantity of seed in the most haphazard manner, to harrow such seed into the soil, and trust to Providence for a heavy crop, is a method which is falling more and more into disuse; but there is still far too much of this happy-go-lucky style of doing things. To sow seed which has been taken from the cob, irrespective of its quality or its trueness to type, and to expect from a piece of land which is literally a forest of weeds a paying crop, is to demand too much from nature, even in the Transvaal. Careful and thorough preparation of the soil, sowing by means of drills, at distances which will admit of constant and thorough cultivation, and the keeping of the soil free from weeds, are some of the methods which must be employed to ensure a paying crop. The use of suitable fertilisers will also have to be resorted to on an ever-increasing scale, as the qualities of the soils deteriorate. We have been flattering ourselves on the fact that we exported some 730,000 bags of maize to the European markets, but it might have been worth our while to have inquired whether we could not have found a market, equally good, and probably better, in South Africa itself. Large quantities of this maize would have been welcomed in the Cape, provided we had given the same facilities by rail to a sister Province as we are giving to the ports of export. A further large quantity might have been employed, as we have already stated, in fattening livestock, and the benefit of the resultant manure, no slight consideration, might have remained with us. Much more might have been used as human food if the railway had endeavoured to encourage the product of local factories which deal with this grain. The present season has been a most unfortunate one for maize-growers, though in some favoured parts the crops are nearly up to the usual average. It is noticeable that the best crops are those of men who have adopted the modern methods above described. We are informed by the Director of Agriculture for the Portuguese Province of Mozambique that, from seed secured through the Agricultural Union of the Transvaal, of last season's crop, the average yield has been at the rate of 15 bags per acre. Probably the average yield in the Transvaal for the present season will not be more than a third of that quantity. There are many exceptions, however, and many growers realise 30 bags per morgen, or 15 bags per acre. It is very regrettable that careless handling of the crop and of the harvested grain should tend to cause dealers to look with suspicion on Transvaal grain. Nondescript maize, accompanied by lack of proper grading, will not take long to inflict a very serious injury upon our chances of capturing the valuable markets which are now open to us, and it is urgently necessary that stringent measures should be adopted in order to prevent careless or unscrupulous growers or traders from inflicting permanent damage on what promises to become a most important industry.

Kaffir Corn.

Kaffir corn, a species of sorghum, is also largely grown, chiefly by the native population, and, while it may not possess the feeding value of sound maize, it is still a most useful grain. It appears likely, however, that it will not find a large market outside of South Africa itself, though there has lately arisen a small demand for the white variety for the purpose of poultry feeding.

Wheat.

Wheat is comparatively little grown, and the imports of flour and meal appear to be on the increase. In 1906 the value of these imported articles was 448,030*l*., while in 1909 it had increased to a sum of 502,796*l*. This is, of course, irrespective of the whole wheat which is imported, the quantity of which cannot be arrived at owing to the fact that the statistical entry relates to "wheat and other grain." While in the Cape the wheat crop has the advantage of winter rains, the crops in the Transvaal during the same period must be grown under irrigation. The summer crops suffer seriously from rust, and, so far, no satisfactory rust-resisting variety has been introduced, though something has been done in this direction. As regards the quality of the wheat produced in the Province, it may be described as good, and with the introduction of newer varieties, and the practice of dry land cultivation, it is hoped that we shall soon be able to supply all local demands. Under irrigation the cost of producing wheat is high, probably amounting to as much as 10*s*. per bag, and when the railway rates are added thereto it is not probable that there will be any immediate reduction in the price of "the staff of life" such as will affect the cost of living. It is estimated that the average yield per acre on dry and irrigated lands is nine bags per acre. The Boers largely use Boermeal for home consumption, and in this they show their wisdom, for a recent scientific writer has compared the man who uses white flour to one who, having bought a suit of clothes, cuts off and saves the buttons, while he throws the rest of the suit away. It is highly probable that, as land increases in value, areas which are waterlogged will be drained and thus rendered suitable for wheat-growing.

Oats.

Oats are chiefly grown as a forage crop, and the grain is frequently of an inferior quality. It is questionable whether, as a dry forage crop, it is not a wasteful food, and whether it will not remain so until the average quality has been considerably improved. Among the varieties chiefly grown are

Boer, River Plate, New Zealand, Egyptian, and Algerian, but it is a rare thing to find a bag of grain which equals the European standard of weight per bushel. The grain is never milled in the Transvaal, even for the feeding of horses, or, if this does happen, it is very rarely. The average yield per acre is said to be some 1,200 bundles, of 3 lbs. weight. Many farmers are beginning to realise the value of a winter crop of oats as pasture for their small stock, and they find that after having run sheep on such a crop they still secure a good return of grain and dry forage. It appears that there is no reason why the Transvaal should fail to produce all that it requires of this crop.

Barley.

Barley is largely used for brewing in South Africa but the brewery owners complain that they cannot buy large quantities of locally-grown grain suitable for their purposes. This statement should be taken with the proverbial grain of salt, and the reason for making it might be sought in the fact that there are few malting plants to be found in South Africa. Attempts have been made to induce farmers to grow a suitable grain, and the "Chevalier" variety has been found to answer admirably, but the guaranteed higher prices therefor have not, it is said, always been forthcoming. The crop is largely grown as green fodder for dairy cattle, which have to be thus fed through the winter months, and it always commands a respectable price. Summer rains militate very frequently against the favourable growth of this grain, and loss is thereby caused to the farmer.

Other Crops.

Among other forage crops which are grown are such as lucerne, millet, teff grass, tall fescue, burnet, paspalum, and clover and ryegrass. The three first named are the most popular, and they are of considerable value. There are farms with as much as 2,000 acres of these imported forage crops. But little of the grass of the veld is made into hay, though much of it is of excellent quality, and it is probable that its feeding value would be considerably increased by such cutting. Cut and cured at the right time, it makes a most excellent stand-by for the winter. The majority of the farmers seem to prefer the burning of the veld grass to the making of hay therefrom, and some excuse is to be offered for them because of the difficulty of cutting on stony and hilly ground. Burning, it is claimed, is also a valuable method of destroying ticks, though it was commonly practised before even the most advanced farmer had dreamed that a tick could be a carrier of disease. The difficulties connected with the trekking of stock to the winter veld are now becoming so great that it appears likely that the necessity will shortly arise for keeping the bulk of stock on the farms all the year round. This is an important question, and due measures should be adopted to assist the stock farmers to continue this practice as long as possible.

Root Crops.

The cultivation of root crops, such as mangel wurzel, kohl rabi, and turnips, is rapidly increasing, and many farmers have succeeded in raising excellent crops. It is only right, however, to say that, for some reason or other, many of these crops have proved to be an entire failure.

Soya Beans.

Soya beans have been introduced into the Transvaal in recent years, and judging from the results at Skinner's Court, near Pretoria, where seven bags were produced from an acre of poor and unfertilised land, there is a likelihood that this crop will prove to be a valuable one. Lever Brothers are offering from 10*s.* 3*d.* to 10*s.* 9*d.* per bag of 200 lbs. at their soap works in Durban. Owing to the fact that the railway charges on 200 lbs. of soya beans from Pretoria to Durban amounts to 3*s.* 3*d.*, there appears to be very little encouragement for the inland grower, and he must remain at the mercy of local consumers in the Transvaal. It is said that there are a number of farmers who are prepared to undertake the growing of this crop, and means should be provided whereby they could secure reliable seed at the lowest rates, so as to commence at once. It would also be necessary to lower railway rates, so as to permit of the seed finding a payable South African market.

Linseed.

Linseed is a payable crop, and it could also be disposed of to the aforementioned firm if transport charges were reduced. Large quantities have been grown during the past season on a Standerton farm, and there is every probability that, given favourable conditions, a valuable industry might be established.

Tobacco.

Tobacco is a crop which is coming into increasing favour among farmers possessed of suitable ground for its cultivation. It is not necessary to enlarge on the prospects of this class of farming, as a Government Commission has already collected evidence on the subject. Suffice it to say that in the Rustenberg district alone excellent profits are being made by those engaged in growing the crop, especially where modern methods are in vogue. There appears to be no immediate likelihood of a decrease of the amount of tobacco which is annually consumed throughout the world, nor of any serious reduction in its market value, as men are always willing to pay for their luxuries. Mr. Scherffius, the Government tobacco expert, has succeeded in growing tobacco which has been valued by dealers at no less than 5*s.* per pound in Pretoria.

Vegetables.

The growing of vegetables is largely in the hands of Italians, Portuguese, Greeks, Chinese, and others, while only a very small number of English or Dutch are employed in this way. When the last-named enter into this class of farming they usually associate fruit-growing therewith. This is probably because they frequently own the land on which they are operating, while the foreign element occupy only the position of leaseholders. It is very rare indeed to find the quality of market garden produce equal to that which is common in Europe, while the prices paid by the consumer are frequently very much higher. This must not be taken to mean that the prices obtained by the growers are always of a satisfactory character. They are frequently just the reverse. The higher prices demanded for the making of a profit may be attributed to the higher costs of production and to the heavy cost of transport to the market.

General.

There can be no doubt as to the necessity which generally exists for the remodelling of farming methods in the Transvaal, and the farmer must learn the value of systematic cultivation, and of the application of suitable manures to his lands. Dry-farming, as it is commonly designated, will, in all probability, play a very important part in the development of the country, though such a term is somewhat out of place in a country where the average rainfall is roughly some 30 inches per annum.

Drawbacks.

It now becomes necessary to deal with some of the drawbacks to successful farming as they exist in the Transvaal, and in doing this it may prove advantageous to recapitulate the various headings of livestock and produce as they have already been given in this statement, mentioning, in passing, such hindrances to success as may apply to each class.

Cattle.

As is well known to the Commission, the ravages of East Coast fever have been of such a nature as to give a very serious set back to the cattle industry, and the least which the progressive farmer can expect

Pretoria, 1 *April* 1914.] Messrs. A. G. Robertson, W. A Pilkington, F. R. N. Findlay, Major R. Doyle, D.S.O., J. L. Van Heerden, and T. Kleinenberg. [*Natural Resources: Animal and Agricultural Produce.*

from the Government is that the laws which have been framed for the purpose of eradicating this disease should be impartially and strictly carried into effect. There are various other forms of local diseases among cattle, and the farmers of the Province are greatly indebted to Dr. Theiler and to the capable staff of the Veterinary Department for the excellent work which they have accomplished during the past few years. The enforcement of the provisions of the recently adopted Stock Diseases Bill cannot fail to have a very beneficial effect on the prosperity of the cattle industry.

Horses.

The chief drawback to horse-breeding, in many parts of the Transvaal, has been the prevalence of horse-sickness, but the farmer is again indebted to the Bacteriological Department for the discovery of means whereby this dreaded disease may be successfully combated. The quality of many of the sires and dams employed leaves much to be desired, and it is highly necessary that the farmer should understand that it will not pay him to produce a class of horse which, no matter how closely it may approximate to his standard of excellence, still fails to meet the requirements of the great majority of buyers. Much might be done by the establishment of a horse breeders' association, consisting of the best horse breeders, who would carefully consider the whole question, and frame standards of excellence which would meet the requirements of those who are most likely to become large purchasers of such stock. It would be their duty, at the same time, to compile standards for the sires and dams likely to produce the class of animal most in demand, and which would command the highest price. In this direction, much valuable assistance would be cheerfully given by the Military Remount Department, and there is no doubt that that Department would annually purchase large numbers of suitable horses, at good prices, for the British Army.

Sheep.

The chief drawback to the sheep-farming industry of the Transvaal, as in other parts of South Africa, is the prevalence of scab. There is also much room for improvement of the general quality of the sheep which are being kept, and for the handling of the wool which they produce. Many thousands of pounds are annually lost to the sheep-farmers of this Province through the careless methods which are in vogue. The most common forms of disease have been rendered preventible or curable through the researches of the Government bacteriologist, and with the due carrying out of the provisions of the Stock Diseases Bill, the fencing of farms, and the cultivation of crops which will serve to provide food for the winter months for the best of the flocks, the prosperity of this branch of farming will be secured.

Pigs and Poultry.

Nothing more need be said in respect of pigs and poultry, which usually thrive throughout the Province, and which may, with ordinary care, form a very valuable adjunct to the ordinary farm.

The ill-treatment of livestock on the railways is a question which is of great importance to stock breeders, and an investigation should be made with a view to putting an end to the conditions now prevailing.

Maize.

As has already been stated, the average yield per acre of maize is about five bags. That of Natal is said to be six bags, while in Rhodesia the average is said to reach seven bags per acre. The average yield in the maize belt of the United States of America has been, for some years past, about eight bags to the acre, and this average could be easily reached in the Transvaal if only the most ordinary care were taken in connection with the cultivation of this crop. There is no country in the world which can excel the Transvaal in the production of this exceedingly valuable crop of grain. We have the advantage over America of being able to entirely dispense with the kiln drying of this grain. It may be remarked that the farmers of Rhodesia, who are but few in number, and who reside in an area which, just now, is being boomed for settlement purposes, are, many of them, most progressive, and this may account for the higher average of their maize yield. From the latest available statistics of the yields recorded in America, where the experiments were conducted on the most modern lines, and where everything possible was done in order to secure an exceptional crop, it appears that the average, in three separate areas, was 88 bushels to the acre, or between 29 and 30 bags. This has been equalled in various parts of South Africa, under similar conditions, and at Potchefstroom the yield has been as high as 84 bushels to the acre, at the experimental farm.

This, of course, means fertilisation and thorough cultivation. In this Province the cost of fertilisers, often of questionable quality, is excessive, and this is largely due to the railway rates which are in vogue. When it is remembered that imported fertilisers are sown at rates varying from 150 lbs. per acre upwards, it will be readily seen that the high costs of transport become a most serious factor in preventing farming from being carried on at a profit. American railway owners reckon that for every ton of fertilisers which they carry free of charge they are called on by the farmer to transport 50 tons of grain to the market. The Transvaal farmer is still waiting to learn why a railway axiom which prevails in America is regarded as a fable in the Transvaal. It is certain that if maize-growing is to be successfully practised in this Province we must make a reduction on the carriage of such fertilisers as are daily becoming more and more of a necessity to the farmer, and also that we must have Government guarantees that such fertilisers are, in all cases, of the quality represented. There are ingredients which, so far as is at present known, cannot be locally produced, and all such component parts of necessary fertilisers should be carried at a rate such as that which is suggested for local products. It is also self-evident that to tax such articles as cannot be locally produced is to take money out of one pocket to place it in another. There is also a great need for the giving of increased attention to the instruction of the farmer by means of Government experts, so that he may be able to appreciate and adopt the latest methods of handling this crop. The admirable work done by Mr. Burtt Davy and his staff, in this particular direction, cannot be overestimated in connection with this important staple crop.

Wheat, Oats, and Barley.

Complaints have been made by millers in the Transvaal that a large percentage of the wheat grown in that Province is not up to standard. This may have been so in individual cases, but there is evidence to show that such varieties as Red Fyfe, &c., of the highest quality can be produced there. There is also ample proof that wheat can be produced at a profit, and what is needed is that the farmer should be kept up-to-date in respect of the varieties which he should grow, and of the methods which he should adopt in regard to cultivation. The remarks made in the previous paragraph, in respect to the cost of transporting the grain and the necessary fertilisers, apply with equal force to these crops. A calculation has been made that, out of the total cost of administering a modern farm in the Transvaal, no less than 12 per cent. consists of railway charges. Surely this should be thought—provoking.

Vegetables.

Most vegetables, such as sweet potatoes, green beans, cucumbers, cabbages, peas, &c., find their way to Johannesburg or Pretoria, and they sometimes realise fair prices, but, owing to the keen competition which has lately sprung up, they often barely pay the expenses of growing and transport by rail.

Potato-growers in the low veld cannot compete successfully against their compeers in the high veld districts, nor can grain be made to pay under the prevailing conditions. Ground-nuts would pay if labour were sufficiently plentiful and cheap, and if transport rates were lowered. A farmer in the Barberton district states that he can secure his fertilisers from Durban *viâ* Delagoa Bay for 13*s*. 5*d*. per ton of 2,000 lbs. less than it would cost him to rail direct from Durban to Barberton. Having had his soil analysed by the Government chemist, he finds that he requires certain ingredients, mixed in certain proportions. He therefore has his manures compounded at Durban, and they consist partly of imported and partly of South African products, in the ratio of two parts of imported to three parts of South African products. If this compound could be carried at South African produce rates by rail he would save no less than 1*l*. 1*s*. 4*d*. per ton. To use this correspondent's own words: "I am taxed by the "Railway Administration at the rate of 1*l*. 1*s*. 4*d*. "per ton for having my fertilisers mixed within the "Union." He further suggests that a Customs duty be imposed on imported fertilisers at the coast ports, and that railway rates to the inland Provinces be lowered, so that our brother farmers in the much-favoured coastal areas would have to contribute their share to the revenue of the Union, in so far as these necessaries of the farmer are concerned. This course, he says, "would leave a little of the cream on the Transvaal milk." While on this subject it may be of interest to point out that from available figures it appears that the total value of imported fertilisers brought into the Union during six months of 1910 was 91,841*l*., while the weight was 67,215,681 lbs.

Dipping Stock.

The value of dipping stock, for the prevention of disease, has been proved, and it is hoped that everything possible will be done to ensure that the system becomes general throughout the Union. It is gratifying to learn that materials for the purpose of constructing dipping tanks will be carried at special rates by the railways, and that local cement will be supplied at specially low rates for this purpose by the Pretoria Portland Cement Company. Their quotation is 8*s*. per bag of 188 lbs., f.o.r., Pretoria, and the firm is also intending to construct blocks of cement for the type of dip recommended by the Agricultural Department. It is very desirable that where local authorities wish to erect such dips on public lands they should be assisted to do so, so that the owners of cattle in any particular community could be induced to dip, and thus remove the danger so commonly incurred in cases where live-stock graze on common lands.

It is also necessary that steps should be immediately taken in respect of investigating such diseases as Lam-galziekte, Stijf-ziekte, &c., &c., so that the threatened spread thereof may be curtailed, and the diseases eventually eradicated.

Scab has proved to be a serious drawback to the successful carrying on of sheep-farming, and stringent measures should be enforced for the prevention of the spread of this disease.

One writer complains that upon a railway journey he has found it impossible to secure Cape brandy, and that it was stated that it could not be supplied. When the catering was in other hands, it was frequently a matter of comment that the supply of South African articles was made a feature of, and that they were always served in such a manner as to satisfy the travelling public. Surely it should be the duty of such a department to assist in the sale of articles of local origin to its customers, especially if the quality be equal to that of the imported article.

Hindrances to Farmers.

It is considered that the following matters should be carefully dealt with, as it is believed that they militate very seriously against the successful development of farming within the Province:—

(1) The introduction of pests, injuriously affecting the livestock and the plant life of this country.

(2) The necessity of securing that none but pure seeds, true to type, be introduced into the Province, and to make the selling of impure seeds, and those containing the seeds of noxious weeds, a criminal offence.

(3) The necessity for the eradication of noxious weeds, especially in areas under the control of municipalities and other public bodies, as there is ample evidence to prove that these weeds are increasing in varieties as well as in numbers. Our railways are among the chief offenders, as may be seen by any observant traveller on our railway system.

(4) The burning of grass and the denudation of the soil, which is thereby assisted, is a serious question, especially in a country whose climatic conditions are such as prevail here. This is also true of the common practice of denuding the country of its indigenous timber without making the least attempt to replace it even by imported varieties of trees which would serve to supply useful timber for many purposes.

(5) The question of the supply of a sufficient number of cheap labourers for farming purposes is of the greatest importance, and we venture to lay before your Commission for favourable consideration certain resolutions passed by the last annual conference of the Transvaal Agricultural Union. These resolutions are attached hereto.*

(6) It appears desirable that a change should be made in our educational system, whereby subjects which would tend to create an interest in country life generally, and especially in agriculture, might find a place on the curriculum of rural schools.

(7) The question of the damage caused by hail and by the visitations of locust swarms will be one in which the Commission will certainly be interested, and they should not be overlooked in connection with the drawbacks in farming in the Transvaal.

5600. **(Sir Alfred Bateman.)** Was this prepared for us?—**(Mr. Robertson.)** Not specially. It was prepared for another Commission, and yesterday, at the suggestion I think of one of the members of the Commission——

5601. No; I beg your pardon. I think it was stated at your meeting a day or two ago that we seemed to have had some agricultural evidence that you did not quite agree with, and you represented that, as you were here in connection with the congress of the Agricultural Union, you would rather like an opportunity of being heard before the Commission; we therefore communicated with you, and arranged for you to attend and lay your views before us?—Yes. That is so. That statement you have was prepared some little time ago. Well, we shall be glad to reply to any questions that the Commission may like to ask, and also perhaps to controvert some of the evidence which has been put before the Commission elsewhere.

5602. Yes. Will you please make your statement? What is it you specially wish to bring before us?—First in regard to cattle and dairying. Major Doyle will speak on that subject.

5603. What have you to say, Major Doyle?—**(Major Doyle.)** You will see that we have put forward a statement in reference to the dairying industry. We have heard that certain evidence was given before you in which it was suggested that centralisation was a good thing for the country, and the elimination of the smaller creameries with a view to keeping up the standard of the product. Well, it is news to us that to eliminate competition is a method of keeping up the standard of any product, and we do not want it to go forth from this country that that is the view of the farmer. We look upon competition in any industry as a healthy thing.

5604. You must remember that that evidence was put before us by the representative of the principal

* Not printed.

Pretoria. Messrs. A. G. ROBERTSON, W. A. PILKINGTON, F. R. N. FINDLAY, [*Natural Resources: Animal*
1 *April* 1914.] Major R. DOYLE, D.S.O., J. L. VAN HEERDEN, and T. KLEINENBERG. *and Agricultural Produce.*

dairying company?—We are glad to hear that you appreciate the point.

5605. Naturally. There are two points of view as regards the central system—the advantages and at the same time the disadvantages of competition in regard to the treatment of dairying products?—Yes. You will no doubt have seen also that as we stand at present our cattle are perhaps not of a very high standard, and the dairying industry here has not progressed to the great extent it has done elsewhere. But one thing I wish to point out is this, that the present prices for dairying products in this country will give us a little time to build up our herds, and at the present moment it is a profitable industry, although our cattle are not of a very high standard, and it will be a still more profitable industry in this country in the future, when we have built up our herds as they should be. The abundant summer rainfall we get in normal years enables us to make ample provision in the way of cattle food in the winter.

5606. Your cattle have been improving very much since the war, have they not?—Very much indeed. The strides that have been made in regard to cattle in this country since the war are enormous.

5607. Is that the case with sheep too?—I am not dealing with sheep; Mr. Robertson will speak on that subject.

5608. Are there any other points?—No. At the moment we mainly wish to emphasise our belief in the future of cattle in this country, and the prospects of the dairying industry in particular, and also to controvert the statement to which I have alluded.

5609. **(Mr. Garnett.)** On the question of the multiplication of creameries, then, we may take it that in your opinion it does not in the least degree militate against the keeping up of a good standard of quality in dairying products?—Of course, there is a limit in that direction.

5610. But you think that within reasonable limits there is fair remuneration, and therefore each creamery should be able to keep up its standard of efficiency in the production of dairy produce, and that a certain amount of competition will be an advantage rather than a disadvantage to the industry's development?—That is our view.

5611. I mean you have no fear of the general standard of excellence being pulled down by a reasonable and proper development in the number of creameries?—We think that a healthy competition will always tend to raise the standard of quality.

5612. **(Sir Alfred Bateman.)** You believe in competition rather than in monopoly?—Exactly. And there is another point in connection with that. Centralisation means to a certain extent centralisation in more ways than one. It means greater distances for the cream to travel, and everybody knows that the sooner dairy produce is dealt with the better the result.

5613. **(Mr. Sinclair.)** Have you a system of grading butter?—Not at the present moment. We are not dealing with any export butter, although that is being inaugurated.

5614. That itself would fix a standard and get rid of the suggestion, if it was made, at Nel's Rust, would it not?—Necessarily. Before you could enter into competition with outside countries you would have to have a standard.

5615. Did you see the distance it was stated that cream could be carried without detriment—long distances—I think well up to 80 miles apart from the rail?—Do you mean 100 miles by vehicle?

5616. By some kind of vehicle, apart from the rail; do you think it is possible that cream can be carried long distances without deteriorating?—Yes, long distances, but not 80 miles. I would say an ordinary distance up to 20 miles by ordinary means. But I question whether it would pay to transport cream 20 miles to the railway.

5617. **(Sir Alfred Bateman.)** Is there any other point in that connection, Major Doyle?—I would only like to add that what I said in regard to distance must, of course, be governed by climatic conditions and the means of transit. In a cooler part of the country dairy products will, of course, travel further than in a hot part, and if the method of transport was by motor car 20 miles and 100 miles would be almost the same thing.

5618. **(Sir Alfred Bateman to Mr. Van Heerden.)** What is the point that you wish to urge?—In regard to the subject of gall lamziekte. In the early days in this country we had lung sickness and it practically cleared the country of stock, but to-day lung-sickness is not at all feared. After that we got this rinderpest, but I must acknowledge that even that is now not feared; it is being conquered by the excellent work of our veterinary surgeons. Since that time we have had East Coast fever. That was practically looked upon by farmers as a hopeless matter, for which we were not going to find any remedy. But in many parts, by means of dipping, East Coast fever is extinguished to-day. Now we have another trouble, and that is gall lamziekte, but Dr. Theiler is investigating the matter, and will no doubt find a solution.

5619. He has not found one yet?—No solution has been found for this disease, but for all the others remedies have been discovered, and we believe that this will be the case with gall lamziekte too.

5620. I suppose Dr. Theiler is in communication with the Home Government and the Board of Agriculture in London to see what help they can give him as to what has been found in other countries. Or do you consider that this is entirely peculiar to this country?—Dr. Theiler, being acquainted with circumstances and conditions in this country, we look to him as the man who is going to solve this problem for us.

5621. As regards diseases generally, you have improved matters very considerably in the last few years, have you not, by dipping and in other ways?—Yes, particularly with East Coast fever. But this gall lamziekte appears to be travelling from one part of the Union to the other.

5622. Are the losses very great from this cause?—Yes, the losses are very severe in many parts of the country, and it appears to be extending.

5623. You only represent the Transvaal, I understand?—Yes.

5624. You take in the whole of the Transvaal—the societies which embrace the whole Transvaal?—Yes.

5625. And that is a pretty large country. Are the conditions very much the same all over?—No, the conditions vary very much. We find that the sickness is more prevalent in the dolomite formation.

5626. There you get pure water, do you not?—There is no fault with the water—it is all fine spring water.

5627. Is that on the high veldt?—Yes, it is fairly high veldt, although about 1,000 feet lower than Johannesburg.

5628. What is your point, Mr. Pilkington?—I would like to observe that there is a certain relation between the climatic conditions and the drought and this lamziekte. One theory again is that it is connected with certain deficiencies in the food which is caused by drought. In wet years we are not much troubled with it. We are passing through a dry period at the present time, and so it is very prevalent. I think, sir, that the remedy for gall lamziekte will be closer settlement. It is most prevalent among dairy cattle, that is, cows which are rearing calves. It points to a certain deficiency of phosphates in the food, because bone meal has to a certain extent proved to be a preventive. When we get closer settlement and animals are looked after something like they are in the old country I think the majority of these diseases will die a natural death. **(Mr. Van Heerden.)** I go further, and say that in reference to closer settlement, that would be a remedy for grass burning, and to my mind—I may be wrong, of course—but I certainly believe that grass burning has to a very considerable extent been responsible for gall lamziekte. As this gentleman has said, it is due to deficiencies in feeding, and there is no doubt about it that if you look into this matter closely you will find that certain kinds of grass possessing certain qualities are disappearing altogether.

5629. By the burning?—Yes, and the drought on top of it.

5630. And you look upon it rather as a dietetic question—a matter of feeding?—Yes, I speak largely from my experience.

5631. Have you anything further to add about these diseases, Mr. Van Heerden?—No.

(Mr. A. G. Robertson.) The next subject is about horses and sheep. I do not think I have any wish to controvert any statement made to the Commission as far as I know about this subject. We have shortly put the position in regard to horses and sheep in our statement. I may perhaps add that the sheep industry is improving very very fast in South Africa of late years, not only in regard to the quality, but in regard to the number of sheep carried per acre; that has largely increased, and there is a far greater number of sheep in the Union to-day than a few years ago. I am sorry I have not got the numbers, but the Commission will get those particulars from the Sheep Division.

5632. I am sorry to say that your statistics are not as perfect as they might be?—That is true, and I hope the Commission will make recommendations on that point.

5633. We shall probably do so.—The farmers would be delighted so that we should know where we are. We find that this country is particularly suited for growing good sheep. Animals imported from Australia do very well in this country. Take the Tasmanian sheep, for instance; they come here undersized and they do excellently in this country, so much so that we find that the progeny grow into bigger carcases, which is very encouraging for introducing this particular sheep from Tasmania. Also sheep from the mainland of Australia do remarkably well and a number of importations are yearly taking place from Australia. We find that not only is the production of wool increasing but it is increasing in value owing to the better quality we are producing.

5634. Do you grow your sheep for the wool or for the mutton?—There are large tracts of country in South Africa—not so much in the Transvaal—where sheep can be grown profitably for mutton.

5635. But you speak chiefly about the Transvaal, I believe?—Yes. The Transvaal is growing a large number of wool sheep, and as it is fed closely we find that the wool sheep thrives in parts of the country where it was before thought that only mutton sheep would grow, so the wool production is increasing very largely.

5636. But shall you get any nearer to supplying yourselves with mutton: can you be independent of imported meat?—Well, we are increasing now, and it will not be many years before we are in a position of independence as regards importing meat.

5637. You have to think of South Africa?—Yes, I am thinking of South Africa in that connection.

5638. There has been a great increase in sheep in the Transvaal since the war?—Yes, and a great increase in cattle also.

5639. And the best of your sheep you have got from Australia?—Yes.

5640. Is there anything else you would like to say about sheep?—Nothing more about sheep.

(Major Doyle.) I should like to say, Mr. Chairman, in reference to your question as to whether we saw a possibility of meeting our own requirements in the way of mutton, as Mr. Robertson has pointed out we have noted that the carcase of the Australian merino—the progeny of the imported animal—is much bigger in this country than in Australia and there is every prospect not only of supplying our own requirements in a very short time, but I think there is every prospect of going outside.

(Sir Alfred Bateman.) I will ask Mr. Campbell, who comes from Australia, to put a few questions to you about that point.

5641. **(Mr. Campbell.)** Can you tell me what is the reason why in a country which seems so well adapted for the merino sheep, and where you have drawn your principal stud stock from Australia, where the farmers have a fairly heavy clip, that in South Africa, your wool clip does not proportionately amount to anything like the amount of the clip grown in Australia?—**(Mr. Robertson.)** You mean per sheep?

5642. Yes.—Yes, because we have not bred them sufficiently long and on good lines to do that. But the men who have imported sheep from Australia since the war, when our own sheep were practically finished in the Transvaal, and have bred them on sound lines have had excellent results, which compare very favourably with the weight per sheep of any of the Australian stations.

5643. But the Australian strains are not very widely distributed among the total flocks, are they?—No, very very sparsely distributed. After all, the industry in the Transvaal is only ten or twelve years old—since the war.

5644. What is the average clip per sheep for merinos in this country?—I am sorry to say I do not think it is more than 5½ lbs. to 6 lbs.

5645. And among those graziers who have thoroughly covered their flocks with Australian strains, does it go higher?—Oh, undoubtedly, and the quality of the wool has improved also.

5646. As to the quality of the wool, on the general average your merino wool does not bring the price of Australian wool?—No.

5647. Why is that?—Just because of the quality that we have not introduced; but in regard to those who have introduced the quality their prices compare very favourably with that obtained by the general farmer in Australia.

5648. You find there is no deterioration in the fine wool sheep grown in South Africa?—No, not if you keep up your standard by breeding from a good strong robust strain.

5649. And is the breeding of stud sheep carried on extensively in South Africa?—Not sufficiently.

5650. You are still dependent on the Australian strains?—Yes, as is proved by the large importations which take place each year.

5651. Well, what is the reason that there are no considerable breeders of South African strains?—I am talking about the Transvaal. In the first instance, all the sheep were finished during the war and we started with practically nothing. After the war people who wanted to start sheep farming in the Transvaal had to buy whatever they could, and they bought culls from the Cape Colony where there were still some sheep, but unfortunately they brought in a tremendous number of culls from Australia—buying them cheap—because we had no money then and we really built up the sheep industry in the Transvaal from a very inferior strain of sheep which we got after the war. And that is the reason why we are only producing 5½ to 6 lbs. of wool per sheep to-day as a general rule.

5652. These Australian stud sheep that are renowned all over the world for their excellence have been bred by men who own considerable properties—men sufficiently well off to be able to devote money and time and attention to breeding. Have you in South Africa these conditions—the big estates that have principally been responsible for these fine strains of sheep in Australia?—No, not generally.

5653. Well, this is the point I wanted to ask about. Would it not be a payable thing and a good thing to establish stud farms here—Government stud farms at which the breeding of sheep could be carried on?—Unfortunately, I cannot answer yes. We know what Governments are, and the breeding of a sheep or any pure-bred animal depends absolutely on the individual who breeds them. If the Government could ensure getting men at the head of the stud farms who would be there all their lives, devoting their attention to the building up of stock on definite lines, I would answer yes. But our experience is that Governments do not or cannot, for some reason or another, get men of that description, men who make it a life study to establish stud flocks. We attempted some little scheme just after the war when there were no stud sheep in the country; and the Government spent a certain amount of money in building up stud flocks on a stud farm. But it has never prospered, and they went to Australia for the foundation stock. But it has never prospered

Pretoria, 1 *April* 1914.] Messrs. A. G. Robertson, W. A. Pilkington, F. R. N. Findlay, Major R. Doyle, D.S.O., J. L. Van Heerden, and T. Kleinenberg. [*Natural Resources: Animal and Agricultural Produce.*

really, and it is only now after twelve years that we see a little bit of improvement in the Government stock, and I believe that the policy will now be discontinued. Now we will have stud breeders—individuals who are at the head of their flocks and who are building them up themselves, and the idea is that the Government should not compete with them any longer.

5654. Has not your difficulty been rather this: in Australia, in addition to having had to breed the flocks, we have had to breed the breeders, and a race of men has grown up there who have the instinct for breeding as well as the time and money to devote to it. Have you tried here to establish stud farms without importing men as well as stock?—In that instance I have quoted the men were imported from Australia.

5655. And they were not successful?—No. But that is no slur on Australia, because we admit that they are very fine breeders, but that is no reason why the same instincts that prevail in Australia should not also prevail here. And we have them as a matter of fact, though not in such sufficient numbers to supply the stud sheep required here at the present time.

5656. And you do not think it would be a feasible proposition to establish State breeding farms?—No, it is too late.

5657. You think there are men here carrying sufficiently large flocks to devote their time and attention to the subject?—Yes, we will supply our own demands very shortly, I think.

5658. But at present it is not being done?—No. **(Major Doyle.)** May I say that the position has been rather a peculiar one in this respect. Mr. Campbell, I understand, has been asking for figures as to the average production of wool in this country per sheep. Now Mr. Robertson has been too modest. He is one of our leading stud breeders, and he has given general figures. Would it be of interest to ask Mr. Robertson what his own average per sheep was for last year?

5659. **(Sir Alfred Bateman.)** Certainly; we shall be very pleased to hear it?—**(Mr. Robertson.)** Well, there are some stud breeders who go up to 10 lbs. per sheep, and get a very good price, but the question is not only what wool you shear off per sheep, but what the return is per sheep per annum. There are lots of sheep in this country which bring up to nine and ten shillings and perhaps even more from some of the best stud breeders.

5660. **(Mr. Campbell.)** From wool alone?—Yes.

5661. **(Mr. Garnett.)** It is a very low average that we have been speaking of then. It refers to all the sheep of all the breeds that are shorn in South Africa?—Yes.

5662. A very mixed lot?—Yes.

5663. But if it were possible to separate the pure merino from the ordinary run of sheep——?—The bastard.

5664. The average clip would be very much higher, would it not?—Yes, very much, both in quality and weight.

5665. You are breeding for wool, I take it?—Yes.

5666. You have done nothing in the way of introducing anything in the way of mutton breeds?—No, but I believe Natal is doing something.

5667. In your opinion, in the Transvaal wool is a better paying proposition than mutton?—Yes.

5668. And it would be more economical to import your mutton and produce wool?—Yes. We have a certain amount of mutton, but not of the highest quality.

5669. **(Mr. Sinclair.)** I suppose that, apart from local requirements for mutton, you have large areas here that call for sheep?—Yes.

5670. So that it must be some time before carcases are extensively sent away. Even when you reach the point of supplying your own people you have much land that you want to stock with sheep?—Yes. There are portions of the Transvaal and outside the Transvaal that are suited for merino sheep which have been stocked with cattle up to now, but owing to these diseases people are giving up cattle and taking to sheep. One disease which used to keep them away from sheep was blue tongue, which carried off a number of sheep in the country. But now we have a vaccine for that and we do not fear it much, so we are going in for wool sheep now in parts where we did not before.

5671. I take it from your evidence that as breeders get rid of the poorer stocks of sheep and approximate to better breeds so will the wool improve?—Yes.

5672. Could you give us the approximate difference in the weight of the fleece between stocks like your own and the average of the poorer class, from which you are moving away?—Four or five pounds per sheep.

5673. That really means about doubling the fleece?—Quite.

5674. Under the improved conditions, I take it the wool-growing industry will be likely to extend?—Yes. That is so. And not only improvement in the weight per fleece, but also the value per fleece, because you are growing a better quality of wool which is a better saleable article.

5675. **(Sir Alfred Bateman.)** Are you satisfied with your rate for the freight of wool home to Europe? It is rather more than Australia pays—three-eighths of a penny as against one farthing per lb.?—Well, generally the farmer is not satisfied with the freight on anything, but I think that on the whole we have not a great deal of cause to grumble about the present freight. I think, of course, that it could be reduced to our advantage. But, of course, I cannot go into the intricacies of what the people who carry it will say on the subject, because it is a question of cost to them.

5676. Yes, and a question of baling?—Quite so. That is one point I would like to mention—the better get-up of the wool. The poor get-up has been the cause of low prices for our wool in the past. The farmers do not get up their wool on the lines they should do. If they would improve they would get higher prices undoubtedly. **(Mr. van Heerden.)** I only want to endorse what Mr. Robertson has said—that as gall lamziekte has carried off a lot of cattle, people have gone in more for sheep and it answers very well. We have been under the impression that sheep would not answer in the Western Transvaal, but now we find they are capable of taking the place of cattle.

5677. You do not get fluke here?—**(Mr. Robertson.)** A negligible quantity.

5678. **(Mr. Garnett.)** It would be too dry?—Well, at present, yes. It is a question of judicious farming. If you have fluky spots on your farm you prevent the sheep going there.

5679. **(Sir Alfred Bateman to Mr. Pilkington.)** You are going to speak as to mealies?—Yes. Mention has been made to this Commission on the subject of pig farming; that it is not carried on in this country very extensively, and the reason given by one witness was that we have no low-lying ground. I do not agree with that. I think the reason is in the first place because it is very easy to over-produce in this country. We have not the factories which give us a regular market. The price of bacon here is 1*s.* 6*d.* to 2*s.* a pound, whereas a consignment of pigs to Johannesburg market to-day might bring as little as 1½*d.* per lb., which does not pay railage. There have been attempts to erect factories, but people here want to get rich quick. The farmer did not immediately produce enough pigs to keep the factory going and consequently it shut down. The farmer, as you know, is everywhere rather slow to move and to change his methods, but once you have got him to change he will keep on. Pig-breeding, I think, is a matter for the small farmer. It pays excellently even at present prices. The average price in Johannesburg is about 4½*d.*; that is, live weight. That is about the top price. But the farms in this country, although they do not compare with the ranches of Australia, are fairly extensive and the majority of farmers are mixed farmers. We do not believe in putting all our eggs in one basket. The majority of us also are short of capital, and although we do produce grain, we market it immediately in order to pay our store bill and settle up. But when a little bit more capital is put into farming that will be the remedy for our present condition, and we will not only produce enough to supply ourselves, but a little bit

Pretoria, Messrs. A. G. Robertson, W. A. Pilkington, F. R. N. Findlay, [*Natural Resources: Animal*
1 *April* 1914.] Major R. Doyle, D.S.O., J. L. Van Heerden, and T. Kleinenberg. *and Agricultural Produce.*

more. And we must have smaller men working smaller areas.

5680. What size area do you think of?—The Transvaal has been said to be a country of samples. Our rainfall varies between 15 inches and 100 inches, and the area which a man ought to farm will depend largely on the district in which he lives. But there are very few parts which do not receive a rainfall equal to that of the county of Kent.

5681. About 20 inches, I suppose?—From 18 to 20, and furthermore we get it all in the growing season.

5682. To set up in a small holding, could a new man do it with 500*l.* or 1,000*l.*?—Well, a new man with 1,000*l.*, provided he will get local experience, will do very well. I did not start with that sum. The majority of us are land poor, if you understand that American expression. I am now farming 5,000 acres; if I had put the same capital into 500 I would be better off to-day. At the same time I would not part with my 5,000. In regard to maize-growing I am living in a district where we get 18 to 20 inches of rain. Previous to the war it was looked upon as a district which would not grow maize economically. Even this year, however, which has been an extra severe year, those of us who have gone in for up-to-date methods of farming will, in those parts where we practised those methods, average a 15-bag crop. The price of land in that locality is anything from 30*s.* per morgen to 2*l.* 10*s.*, so that with the profit you make on your maize you can more than doubly pay for your land the first year. That will give you an idea of what this land can do. Now, sir, I maintain that land like that is crying out for capital and energy and men to work it. The maize growing in this country, as far as I understand—of course, we are liable to say that we do better than anyone else who went before us previous to the broadening of the Agricultural Department—is greatly improving. Formerly there were only two kinds grown—white and yellow. Now the breeds are becoming more specialised. We are importing breeds from America, and we find that not only can we keep up the American standard, but we can improve on it; so much so that Mr. Burtt Davy, who was our great expert in maize, in fixing the standard for shows has increased the standard of excellence as set down for similar shows in America. He has thought it well to do so, which shows that we can produce excellent maize. Then as to the market we have many advantages. In the maize belt in America the planting season is very short. In the best places I know of they only have three weeks to put in their seed, but here we have three months to put the crop in. Then in America the frosts are severe, and you have to be in a hurry to get the crop off the land. That restricts the output—shorter sowing and shorter reaping. In this country we have a longer season and can reap at any time. In winter we are absolutely dry. Once our maize gets ripe we can take our own time to reap it, and that is partly the reason why we can produce maize of such excellent quality. We have not to kiln-dry it. The sun dries it and the labour is less.

5683. Does that account for your getting 2*s.* more for it on the London market?—I think, partly. American maize is kiln-dried and not properly ripe.

5684. What have you to say about what happened two or three years ago when you had to import your own maize from Europe at enhanced prices?—I think that was owing to what was referred to just now—the poor system of statistics. We thought we had a big surplus. Then we had a drought which increased the consumption. The farmers, instead of sending maize to market, had to feed it to the cattle, which did not leave us the surplus we expected.

5685. The consumption is an uncertain quantity then if you get a drought? You have a bigger home consumption?—There is a regular consumption for the mines and the natives, but the consumption at present is an uncertain figure as regards stock.

5686. **(Mr. Garnett.)** Does your Government make any estimate as to the condition of the crops at all from time to time during the year—like the American Government, and like we do at home?—There is nothing on the same scale yet. In time there will be some statistics collected. At present they are very unreliable, and are collected by field cornets in the districts.

5687. Then you have no idea from reliable statistics what the condition of the maize crop is likely to be?—No, except in our own district, more or less.

5688. And hence you fall into the error of over-exporting?—Yes, it happened a couple of years ago. But I may say that the farmer does not control that. It is controlled by the speculator. The farmer in the majority of cases does not export direct, because he would have to put so many tons on shipboard, and even if he had the amount of maize the labour involved in riding it from the farm to the station and loading it would not be economical. You cannot keep the number of hands on all the year, and in this country you have to keep the natives that work for you on regularly. There is little or no casual labour to be had. That is another drawback.

5689. **(Mr. Sinclair.)** You told us that pig-rearing was most suitable for small farmers?—Well, it pays well, but we have so many other things on hand that we have no time for it.

5690. You have so many profitable sources of employment that you are able to pick and choose?—That is so.

5691. I wanted to ask whether there is land available for small farms in this Province?—Well, land can be purchased by the private individual at anything between 15*s.* and 6*l.* a morgen—which is two acres and one-ninth.

5692. Is that land in private hands?—There is very little land in this country which is not.

5693. Is there room for the small outsider coming with a little capital, or is all the land absorbed by your own people?—Of course, extra competition will always send up the price, but any outsider can to-day buy land in the market at the prices I have quoted.

5694. Is the tendency to reduce the size of holdings here?—In my locality, yes. **(Mr. Robertson.)** And all over.

5695. And the fact that you get summer rains and can grow winter food makes small farming profitable, does it not?—It does. At present we do not grow enough winter feed. We rely on the size of our holdings to carry the stock right through.

5696. But as the size of holdings is reduced there will be more reliance on winter feed?—I do not think we know the carrying capacity of the farms. I think it would be 10 or 15 times what it is at present. You can grow 10 tons of maize ensilage per acre here and that is a very moderate estimate, and in average years when we get more rain our grass is always standing like your meadows at home, in Kent, in summer time.

5697. Can you tell us why with its rich resources your land is not more largely exploited?—Well, we have not boasted our advantages. I believe we are a very conservative people—the farmers. I believe the majority of the old population do not want new people in the country. They do not see the advantages accruing therefrom. I do not say that of the progressive section of the population; but, unfortunately, some of our farmers are not progressive. Then we have had many drawbacks. We have always been at war. We have had practically every disease imaginable to combat. And when you come to think of all these things, the wonder is that we have made the progress that we have. There was the backward state of science in this country—the uneducated position of the farmer—because in thinly populated countries education is difficult. I say in view of all these things our advance has been little short of marvellous. Then there have also been so many other attractions. People wanted to get rich quick and went to the mines.

5698. That is the point I was coming to; is it not a fact, in addition to what you say, about the drawbacks, that in the past the readiness with which people have been able to make money in mining has diverted attention from the cultivation of the soil?—I think so.

Pretoria, Messrs. A. G. Robertson, W. A. Pilkington, F. R. N. Findlay, [*Natural Resources: Animal*
1 *April* 1914.] Major R. Doyle, D.S.O., J. L. Van Heerden, and T. Kleinenberg. *and Agricultural Produce.*

5699. And is there now a disposition, do you think, to go in the opposite direction and to take to the permanent course of wealth—the land?—As far as I can see the present trend is decidedly in that direction. I find the country doctor, the lawyer, the storekeeper, all have their farms, and their idea is at some time or other to retire on to the farm. I think it is a good movement.

5700. **(Mr. Campbell.)** Can you give a reasonable explanation of the fact that in a country where, I suppose, bacon is dearer than anywhere else and maize can be most cheaply produced these bacon factories did not succeed?—I say it is purely owing to the fact that the farmer here is so conservative. He is slow to take up any new branch of business. Once someone shows him that it pays he is as keen as anyone else in making money. In this country with our wide areas, news travels slowly. A good many do not read the newspapers. Our labour is very scarce because we have to compete with the mines. In view of these different factors it takes some time to make a thing pay. People want to jump into a thing all at once. But the farmer never expects to make any new line of business pay for a matter of two or three years.

5701. That only makes my difficulty all the greater. I have never been in a country where the farmers, no matter how conservative they might be, have not been ready to make money when the opportunity was there, and here I cannot see why, with your opportunities of growing maize cheaply and with the best market for bacon in the world, and with all the opportunities that exist, you cannot stop this importation of some hundreds of thousands of pounds worth of bacon products every year. Can you give any other explanation?—Well, the fact remains that we have not done so, and the fact remains also that people—men I know—are making a very excellent profit out of pig-raising.

5702. You say you have other lines that pay better than this. You have quoted maize as one; what are the other things that pay better than bacon at South African prices?—I would like to qualify that. For the labour involved and the amount of labour involved. To rear pigs successfully you want reliable labour and regular labour. They want feeding regularly and they want close attention. That labour you have not. We have only the raw savage and he is most unreliable. You cannot always be looking after these men, and so the pigs are being neglected. In that way, the man running a pig farm cannot give it the necessary personal attention and close supervision which it requires. The farmer on a large mixed farm to-day cannot afford it. He has not the labour at his disposal. That is why I said it was essentially a thing for the small man who can give it personal attention.

5703. Well, could you suggest any possible policy to the Commission by means of which the small man could be brought on to the land and this industry fostered?—I do not think I can. I hope the Commission will find a way. By immigration, possibly.

5704. But we are here to receive suggestions from people who understand local conditions?—Well, I think the difficulty will to a certain extent be removed if the right class of man from home comes to this country. We only want of your best. On account of our native question we cannot absorb the people they absorb in Canada or the United States or Australia. The class of man I should like to see come here is the boy who is a natural born leader—who leads in sports, in games, and in every branch of public school life. With that class of immigrant this country would rapidly develop. On account of the native question we cannot absorb the thousands of people who every year go to America and Canada. And I think that is partly the reason why we have in the past rather paused in encouraging immigration.

5705. **(Sir Alfred Bateman.)** You want a class that is rather scarce even in England?—Yes, I am afraid so. But that is the need.

5706. **(Sir Alfred Bateman to Mr. Findlay.)** What is your point?—In regard to wheat and tobacco and a few other crops that are grown on irrigated land—I am speaking on behalf of the small holder—the man who may in future come to this country and who will work a plot of irrigated land of, say, 20 morgen at the outside under water, and with a certain area of dry land, possibly 200 or 300 morgen altogether. There are many parts of the Transvaal where a man cannot exist on 200 or 300 morgen, but if he is in a district like Rustenburg, which is semi-tropical, or in a part of the Marico District, or in the country round Pietersburg, which is not absolutely low country but perfectly healthy, I think such a man could do well with tobacco and wheat, provided there was irrigation. The small man would do very well. We have unlimited possibilities in this country for tobacco, but we want an over-sea market. We have been selling tobacco and making money rapidly for a few years, but we have now got a trust which we feel is beginning to influence the tobacco trade.

5707. Have you a trust of your own?—No, but it is working in this country. The company buys the tobacco and is bringing down the price. We are endeavouring to fight it with co-operation, but it is hard work; and if we could get an export of our tobacco, even at a very low price, it would still pay us because we could sell our local tobacco at a better price. We could export pipe tobacco at 4*d*. per lb. and by getting a high price for the local product it would bring up our average. One cannot grow tobacco at 3*d*. and 4*d*. to make it pay unless we get a higher price for the local product.

5708. You want a second market?—Yes. We as growers are willing to place large quantities of tobacco at the disposal of our Government if the Government will place it on exhibition in other countries, and it has occurred to me that if, say, Australia were to exhibit our tobacco in Sydney and Melbourne, it would help us to get a market and we think our Government should approach the other Colonies with that object in view.

5709. You do not expect the Government to go into the business itself, but only to help with these exhibitions?—Yes.

5710. I suppose you know that at the Imperial Institute in London there is a complete exhibit of your tobacco?—This is probably true if you include the exhibit recently sent to the Sub-tropical Exposition, which is to be held in London this year. But there is a laxity amongst us in that way which is to be regretted. Our Trades Commissioner is constantly complaining that it is not done, but we hope to do it. The point I want to draw attention to is the openings for the small man. Two men, for instance, with a couple of morgen of land can make a good living provided there is irrigation, and we have large irrigation schemes in the low country. The high veldt, as we know, is the watershed, and as the Administrator remarked yesterday the country is not suitable for large schemes of irrigation because we are too close to the watersheds. But with all due deference I make this one exception, apart from the instance which he gave, namely, that of Hartebeeste Poort on the Crocodile River. There are several large rivers in the low country that would pay very well to dam up, and then we could produce tobacco and cotton and many other tropical products for which the small holder would find very profitable employment.

5711. Have you any idea what is the quantity of land in the Transvaal which could be irrigated?—Take the Hartebeeste Poort scheme as it is called, which is three hours from town. There is virgin soil, I believe, of about 30,000 morgen which could be put under irrigation. It was asked where we were going to obtain the land. But under that scheme the Government would take half the area and this land the Government could immediately place at the disposal of settlers; and if we can get anything like a market over-sea there is no doubt that the tobacco farmer, who will always be a small hard-working man, will make a good living.

5712. **(Mr. Garnett.)** Are you producing all the pipe tobacco that is consumedi n South Africa to-day?—No, a considerable amount of tobacco is imported

Pretoria, Messrs. A. G. ROBERTSON, W. A. PILKINGTON, F. R. N. FINDLAY, [*Natural Resources: Animal*
1 *April* 1914.] Major R. DOYLE, D.S.O., J. L. Van HEERDEN, and T. KLEINENBERG. *and Agricultural Produce.*

into the country. There is room for considerable improvement in the manufacture of our tobacco.

5713. Is it a matter of taste more or less?—I think it is a matter of manufacture.

5714. I mean that the tobacco appeals more to the smoker's taste from the way it is put up than yours does?—I think so very largely, the fault lies with the manufacture and not with the grower.

5715. Something might be done to improve your process by better methods to make the tobacco more palatable?—No, the quality of our tobacco is admitted to be good, but there is an over-production of pipe tobacco, and we must get an export market.

5716. Then you do not hope to supply the whole of your consumption?—I think that in time, as the manufacture improves, we can produce that same class of tobacco.

5717. **(Sir Alfred Bateman.)** What is this Trust you spoke of?—It is the United Tobacco Company.

5718. Do they own shops?—No, but they have a big influence with the storekeeper, and I think that ultimately the trade will be practically in their hands

5719. So far as you know, is the trade in the Transvaal in their hands?—It is gradually getting into their hands.

5720. The difficulty will be to sell your tobacco to anybody else?—It is very difficult.

5721. **(Sir Alfred Bateman to Mr. Kleinenberg.)** What are your points?—The few points on which we have not touched in the memorandum. I take it the object of the Commission is to hold out inducements to people to come and settle in this country, and to show what the possibilities of South Africa are as a whole.

5722. Our reference is not quite that. We have to inquire into the various questions affecting the resources of the Empire and the interchange of trade between the Dominions and the Mother country, and to make recommendations?—We would like to point out the possibilities of this country for farmers who tackle work with energy and with a moderate capital. I would like to point to the great advance made in growing lucerne in the Transvaal. Years ago it was grown almost only in the Cape Province, but in the last couple of years we have had excellent crops in the Transvaal, especially on the dolomite or limestone formation. In the district where I live, the Zoutpansburg district, we get from 1½ to 2 tons per acre, and we can cut as many as eight or nine times a year.

5723. How many years does it remain without resowing?—It has not been grown here for long, but I think from five to ten years. In addition to lucerne-growing we have lately introduced into the Province a profitable source of farming in the way of ostriches. I think it has been shown that we can grow excellent feathers in this part of South Africa. Of course, the slump in the feather market, due to the vagaries of fashion, has affected the industry, but we do not think it will be a permanent set-back; we think it will be profitable in the future.

5724. Are there a large number of ostriches here?—Pretty considerable, but I do not know the number. Then there is the question of cotton-growing, which has been proved to be possible in the low-lying parts. The Government for years past have carried on an experimental station called Tzaneen in the Zoutpansburg district and they have grown some excellent cotton. Another possibility is sugar-cane. There was a recent article in the *Agricultural Journal* in which it states that it has been proved beyond question that sugar-cane of commercial quality can be grown in the Zoutpansburg District. We have a very large area there which can be put under sugar-cane, and, I think it will only be a progressive policy to induce men to go in for that class of farming and open up attractive country which has been lying dormant for twenty to twenty-five years.

5725. Can you get labour easily?—Very large quantities. The value of land in that district, which comprises 25,000 square miles, is from 10*s.* to 50*s.* a morgen, which is very low. It is a very sparsely populated district with a population of only about 12,000, but with a large native population of about a third of a million. I point out this to show the possibilities of settlement in that part of South Africa and the branches of the farming industry which are capable of development. In addition to those there is the cattle-ranching industry which has been taken in hand in Southern Rhodesia by the Liebig people. That territory is on the northern borders of our district. They have embarked on a very big cattle-ranching scheme, and a part of our country is practically identical to that of Southern Rhodesia.

APPENDIX I.

Evidence given by Mr. LEWIS H. S. JONES, Managing Director of the Newcastle Creamery Company, at Newcastle, Natal, on Monday, 23rd March 1914, before a Committee of the Commission, consisting of Sir RIDER HAGGARD, Mr. T. GARNETT, and the Hon. E. R. BOWRING.

1. **(Sir Rider Haggard.)** What is your position here?—I am Managing Director of the Newcastle Creamery Company and a produce dealer, and have been resident in this district for the past twenty-seven years. When I first came here the farmers were only growing small quantities of mealies and potatoes, and up to sixteen years ago I had to proceed to Harrismith and Ladysmith to get my supplies. Since the last war, however, in 1902, more farmers have come into the district, and they have been able to grow enough mealies and

potatoes for themselves, and send a supply to the markets of Johannesburg and down country as well. This is owing to a number of progressive farmers coming here and going in for agriculture and mixed cattle-farming. This is a good district for potatoes, and we can grow two crops, early and late. The late crop is taken out in winter, and finds a ready sale in Johannesburg and Pretoria. The potatoes for the past three years have been good, and I can safely say the last crop were sold at 15*s.* per bag of 150 lbs. This worked out at 10*l.* per ton, f.o.t. railway, Newcastle. The reason for the good prices is that the Johannesburg produce dealers buy up winter crops of potatoes in advance, on account of their keeping qualities. The early crop averages about 7*l.* 10*s.* per ton. I have known farmers produce 5 tons per acre.

2. What fertilizers do you use?—Saffco (C.A. Fertilizer Co.'s) and Fison's fertilizers (imported). The district also produces Kafir corn, while mealies averaged eight bags, or 1,600 lbs., to an acre, up to 15 bags mealies per acre, 3,000 lbs. Kafir corn would return about 10 or 12 bags per acre, but the ground requires fertilizing, and sells on an average for 15*s.* per bag of 200 lbs., say 7*l.* 10*s.* per ton. The district also produces Kafir corn, mealies, forage, and wheat, but the two latter not to a very large extent, the climate not being suitable, besides which we cannot compete with other parts of Natal, Free State, or Northern Cape Colony. The introduction of the "white flat rate" is a great drawback to the farmers. Cape forage, from the Malmesbury District, Cape Colony, can be brought by rail to Newcastle for 30*s.* per ton, while to send forage from here to Durban costs the same amount. Malmesbury is a great forage and wheat district, and the farmers go in for it largely, thus blocking Natal farmers, and it is impossible for us to compete with them, besides which the climate and soil are a drawback.

3. Are there any other crops you can grow?—Yes, lucerne, but there are no facilities for irrigation here. We erected a weir about 3 miles down Incandu River, and it has been very successful, and a large extent of ground could be irrigated if the Buffalo River were dammed up by Ingogo. We have been very unfortunate in our normal rainfall for the past few years—our seasons are not as they were a few years ago. I could not say what the normal rainfall is. It is not regular but falls in patches, but I believe the approximate rainfall is 26 inches.

4. If there is this amount of rainfall, you do not want to depend much on irrigation, do you?—No, not to a great extent, except for winter crops.

5. Which are the best paying crops?—Potatoes, mealies, and Kafir corn. On the whole this is a good cattle district. During the rinderpest large numbers were wiped out, but since then farmers have improved their stock. For four or five years the cattle suffered heavily from East Coast fever, but, notwithstanding, the farmers find their stock is increasing now they go in for dipping.

6. Since dipping has been introduced, have you lost many cattle through disease?—The East Coast fever only broke out in the township about twelve months ago, but I can safely say that we have not lost 20 head since dipping. Since dipping the disease seems to have stopped. No one need fear to import stock if they dip regularly.

7. Is there any sickness where cattle are effectually dipped?—No.

8. How about sheep? Is it a good sheep country?—It is a good district for sheep, and the farmers find that during the winter months sheep are sent here from the Transvaal and the Orange Free State.

9. How about horse-sickness?—There is not so much as in the past. We had it for several years, but it is certainly not so prevalent as formerly. Quite a number of farmers are dipping for sickness.

10. Is the agricultural position here generally prosperous?—Yes. I know young farmers who started here eight or ten years ago on mixed farming, cattle, and agriculture, and they are doing well.

11. What amount of capital is required to start an average farm here?—When I came here land was 15*s.* an acre, but now it is up to 40*s.*, and a farmer starting in this district now would require three times the capital necessary in former days, because now they have no transport riding to do and have to depend solely on the farm.

12. Is all the land farmed?—No, a good few of our farmers have farms also in the Free State. Between Buffalo Bridge and Utrecht and a distance of about 14 miles there are only four farms, and they are all sheep farms. The sheep and cattle farmers do not care to part with their land here. It is surprising the amount of land we have here which is only used for grazing. If the land were sold we should have a larger population. Land cannot be bought here under 40*s.* per acre.

[Witness considered that the farms sold by the Government were worth the price asked, and added that a man could not start farming in the district with a smaller capital than 2,000*l.* to be independent.]

13. **(Mr. Garnett.)** Can you tell us the amount of land which has come under cultivation, say, in the last fifteen years?—I cannot.

14. Can you say how much the population has increased since peace?—I cannot; I can only say that we have more children here than we had fifteen years ago.

15. Has the opening of more collieries brought increased population to the neighbourhood of the town?—I cannot say what the increase would be, but it is, at least, over 300 per cent. If you take the European, native, and Indian labour, I am safe in saying that it has increased over 300 per cent.

16. It follows that, in spite of this large increase, you have been able to support the population and also to export. Can you say what this is due to?—It is due to more land being cultivated.

17. Do you consider this place suitable for closer settlement?—Yes.

18. What is the minimum size of holding you would recommend a man starting upon?—Not less than 400 acres of good soil.

19. What capital would he require?—2,000*l.* would be the minimum to pay cash for all requirements and to keep free of debt.

20. What are your dipping regulations?—We are required to dip for five days in the summer and seven days in the winter. It is compulsory to dip sheep for scab.

21. **(Mr. Bowring.)** You referred to two qualities of potatoes—the early and the late. Is there much difference between the quality of the two?—Yes. The early crop is gathered in December, January, and February. The consequence is that the potatoes are wet and will not keep. Most of the potatoes grown here are from imported seed, and we import every year, because we are unable to keep our seed for the late crop. We get nearly all our seed from England—Sutton's and other seedsmen.

22. Are you making any advances towards improving your crops?—Yes. There are farmers who grow their own crops specially for seed. Potatoes have improved of late years.

23. You referred to the railway rate as being 30*s.* per ton. Will you tell us something more about this? Is it the same all over the Union of South Africa?—From Cape Colony to Newcastle it runs 1*l.* 10*s.* per ton, but this is only allowed on long distances. You can send mealies from here to Cape Colony at the same rate as from here to Durban—260 miles. That acts very much against us, and is not good for the community at large. With regard to fertilizers, Saffco is a Durban production, and is largely taking the place of imported fertilizers.

24. With regard to irrigation—have you plenty of water here?—Yes. It runs to waste. If it was stored there would be plenty for irrigation. Very few farmers have dams; certainly not like the Free State and Cape Colony.

25. Does there seem to be a great demand in this neighbourhood for irrigation?—I could not say, but there would be if tried.

26. With regard to the sheep which are pastured here in the winter, do they come very long distances?

—Yes, from Standerton and Vrede district; that would be about up to 100 miles, and from other places, while places in Transvaal farther away send their sheep to Swaziland in winter.

27. **(Sir Rider Haggard.)** You have told us that no farmer can successfully start a farm with a smaller capital than 2,000*l.* That means, of course, that very few can start, as few young men have that amount to invest in land, &c.?—Well, if he starts on 2,000*l.* clear he can do well and is a made man.

28. Can a man desiring to start farming get any assistance from land banks?—We can get assistance in Natal now, but I do not think the terms will be so easy in the future, as the land banks have been lending out money at a loss to farmers. I do not know to what extent a man can borrow from the land banks, but the private banks would prefer to lend money on farms than on town properties.

29. You talk about 400 acres as a minimum. Do you infer that this means that it is all good, deep, arable land?—It should be good arable land.

30. What is the depth of your soil?—From 2 feet to 12 feet; it varies.

31. **(Mr. Garnett.)** Into what sized lots has the town cut up its land?—Into about 300 to 400 acres.

32. Now, will you tell us briefly about this creamery?—In October 1912 we had a capital of 3,000*l.*; we eventually got 4,500*l.* From October 1912 to September 1913 we paid out on 113,148 lbs. of butter-fat, which averages 9,429 lbs. per month. From October 1913 to February 1914 we paid out on 83,531 lbs. for the five months, which averages 16,706 lbs. per month. The cream falls off from May and continues to do so up to September, but, of course, if we could get it all the year round it would be better for all. The money paid to the farmers from October 1912 to September 1913 was 7,709*l.* 9*s.* 10*d.*, averaging 642*l.* 9*s.* 2*d.* per month. Since we started the creamery, under two years ago, all this money is circulated around the district. Prior to that a lot of farmers never sent cream away, but when they found their neighbours drawing 12*l.* to 15*l.* per month, others joined in. This is one of the best districts for stock from this side of Ladysmith up to Charlestown. Farmers have been buying in this district to stock the lower districts of Natal. If we can get closer settlement here we shall have more farmers going in for the 400 to 500 acres.

Our butter is valued according to the Australian and New Zealand markets. Australia can land butter at 1*s.* 2*d.* per lb. wholesale: we can get 1*s.* 4*d.* per lb. The average price throughout the year is 1*s.* 3*d.*

33. **(Sir Rider Haggard.)** That is higher than the Australians can land it in your own country?—Yes. We had a loss of 500*l.* last year, but within the last five months we have wiped that off. Last year we had 200 suppliers; this year we have 260.

34. Are the farmers shareholders?—Yes, as well as the town people. It is a co-operative dairy.

35. **(Mr. Bowring.)** How does your butter compare with Australia and New Zealand?—Very well. It compares very favourably with imported butter and fetches equally good prices in the market. If more creameries were started in good districts they would do well. The whole of Natal can thank the Hon. Joseph Baynes, of Nel's Rust, for starting a creamery. He is the father of creameries here and the pioneer of dipping cattle.

36. **(Mr. Garnett.)** What about the quality of the cream supplied to you?—We find that the quality is of a very high percentage of butter-fat, containing on an average 48 per cent.

37. What is the explanation of that high percentage?—It may be on account of the quality of the grass and cattle, and it may be that the farmers feed their cattle as well.

38. Where is your butter sold principally?—In Johannesburg and its district and the northern district of Natal. The railway rates are very cheap; no matter what the distance, the cream is carried at 1*d.* per gallon and the cans are returned free.

39. The Government is doing what it can, by low rates, to assist your industry?—Yes.

40. Are your profits divided in the form of dividends or bonuses?—It is in the form of a bonus to supplier and shareholder.

41. **(Sir Rider Haggard.)** What is the average wage paid to white labour employed on the land?—I do not know.

42. Is native labour plentiful?—Yes, but the difficulty is to get the native to work on farms. The farmers complain about the scarcity of native labour. They will work on mines; they will work in towns, but they will not work on farms.

43. What do you consider a reasonable wage?—I would rather the farmers answered that. I think that a farmer should pay a native a wage of 1*l.* to 1*l.* 10*s.* a month, the same as they do in towns, and then I am sure the native would not leave the farm.

APPENDIX II.

Johannesburg, Thursday, 2nd April 1914.

Evidence given by Dr. William MacDonald, author of "Dry Farming: its Principles and Practice," sometime Government Dry Land Agronomist, and Editor of the "Union Agricultural Journal," before a Committee of the Commission, consisting of Sir H. Rider Haggard and Mr. Tom Garnett.

(*For evidence of this witness on "Land Settlement and Irrigation," see p.* 47.)

(Witness.) I would like to point out that there is at present a great lack of agricultural statistics in this country, and I do think that an effort should be made to put the statistical problem on a proper basis. For example, owing to this lack of statistics, our farmers are apt to be rather careless, and they have no proper idea of how much seed they sow and how much harvest they are reaping; consequently it is very difficult to give you data regarding produce per acre. There is no doubt in my own mind that we live in the richest agricultural country in the world. By that I mean to say that our farmers are getting heavier crops per acre than any other country I know of. Now, I want to turn to the subject to which I have given the most attention. For the last ten years I have devoted my attention mainly to dry farming. To-day, it is difficult to describe the marvellous transformation of the agricultural industry in South Africa due to dry farming. Before we started our campaign in this country, about six years ago, nobody had any idea that these high dry lands would successfully raise crops. Well, what have we proved? We have shown that not only can you grow cereals such as maize, wheat, barley, and rye, but you can also grow mangolds, turnips, and potatoes, and you can grow all your fruit trees on these dry lands. The effect of dry farming has been revolutionary. There is nothing like it in modern agriculture. Now, you might say to me, what are the limits of dry farming? There are practically no limits. For example, if you were to come with me

into the Kalahari desert, what would you find? You would find there the wonderful Tsamma melon, which grows on, say, a 4-inch rainfall on the top of a scorching sand dune. You would find too there the Bushman grass which grows on a 2-inch rainfall. Consequently, there are no limits to drought-resistant crops and the extension of dry-farming method. But that leads us to another point. There is no doubt in my mind that at the present moment we are witnessing the invasion of the desert. The other day, a friend of mine, who is one of the most practical agriculturists in this country, Mr. William A. McLaren, the representative of that well-known English firm, Messrs. John Fowler & Co., Ltd., Leeds, came to me and said: "I have just come through a desert, and it is not the "Kalahari, or the Sahara, but the western Free State." Now, you can readily understand the seriousness of the situation, if desert climate is extending into the Free State. It will not be long before it will affect a very large agricultural section.

1. **(Sir Rider Haggard.)** Is there any cure?—Certainly. What we should do is to try and restore the old conditions of this country by afforestation. This country once had a great deal more timber. For example, if you were to go to the region around Kimberley you would find the stumps of thousands and thousands of these beautiful camel-thorn trees, which are very slow growing and which have been ruthlessly destroyed in the early days and used up for fuel and props for the Kimberley mines. But that is only one small area. The same thing is going on all over the country. I do not know any country in the world which really is witnessing such frightful devastation.

2. Would you kindly explain to us what is the exact effect of the cutting of these trees with reference to the rainfall and the conservation of moisture?—The first thing you notice when trees have been cut down is the baking effect of the soil. The soil becomes as hard as iron, and what is the result? The rain comes down on that soil and it washes all away. The second point is "sluiting" or the formation of dongas. Now, if you were to come with me to the Free State you would see the finest land in South Africa being washed away; and that Free State land is the best wheat land in the country. All along the Basutoland border, and, indeed, that whole country-side is being cut up into dongas. These dongas are growing deeper every day. I am convinced that if our Government would only make it compulsory for every farmer to plant a few trees the effect would be amazing. Compulsory tree planting is as important as compulsory dipping. Trees have a beneficial effect in changing a dry climate to a moist climate. I am certain that if we were to commence a great scheme of national afforestation we would gradually change our arid conditions and throw back the frontier of the desert.

2*a*. Would you kindly define to us the meaning of dry farming?—Dry farming may be defined as the conservation of soil moisture and the growing of drought-resisting plants. Firstly, the conservation of soil moisture. How are we going to conserve the soil moisture? Suppose that you were to go on to the bare veldt and intended to plough up 100 acres of land. You must wait, of course, until the rain comes in order to get your plough into that land because it is baked hard by centuries of time. Once that land has been ploughed up you must leave it for a whole year with nothing upon it; cross plough it and harrow it. You then wait for the next rains. Instead of the rains running off the bare hard veldt, as formerly, it sinks into the ground. You then harrow again to form the ground blanket or soil-mulch. There is always a tendency for the rain to come to the surface again. It is, doubtless, drawn up to the surface by surface tension, or, in other words, by the rise of the capillary soil films.

3. How deep does that rain go down, and from what depths does it rise?—An English authority, Mr. A. D. Hall, of Rothamsted, has traced the rise of water from a depth of 200 feet. If it is true that water rises from that great depth it is equally true that the best soil is one of uniform texture which is not broken by different strata or rock formation. Rain which is rising by means of the capillary soil films, when it comes to any intervening layer, is blocked and does not readily get to the surface. It will rise, however, easily through soil of uniform texture. But you do not want it to escape from the surface, and that is why you must keep the surface loose. If you keep the surface soil loose it forms the dry soil blanket or "mulch" which effectually prevents the evaporation of the soil moisture. I now wish to touch on the fall of water. The rain that falls on the land that we have prepared for dry farming soaks into the ground, but it soon rises again to the surface, but we do not let it escape. In other words, we bottle it up so that we can draw upon it as required. At the present moment we are holding that rainfall as a reserve against a period of drought. My own view is that this reserve of rain may be held in the ground for two or even three years. Now, what does this mean? Dr. Widtsoe, in his book on dry farming, mentions experiments in Utah, in the United States of America, which have proved that the heaviest crop has been harvested in the year of drought. It is evident that such a crop is not only utilising the rainfall of the current year but is drawing on the reserves of the banked-up rainfall of the previous year. Therefore, if we can hold in our soil a moisture-savings bank, then we can eliminate the danger of drought, because we are not working on the rainfall of the present year, perhaps a very scanty one, but we are drawing on the rainfall reserves of previous years.

4. I have seen in passing some terrible examples this year, which I presume are farmed on this dry farming principle. I have seen mealies not more than 18 inches high, and, if your arguments are sound, I do not see why both mealies should not have been, at any rate, normal. How do you explain that?—The reason is that the farmers whose mealies you have seen have not been carrying out our dry farming principles in the proper manner.

5. You believe that South Africa is agriculturally the richest country in the world. How do you justify that belief?—By the variety of its products. There is no country in the British Empire, there is no State in the United States, that can produce a larger variety of crops than we can produce. If I had time I could show you the sugar zone, the tea zone, the wattle zone, and the potential coffee zone and fibre zones. In the Zoutpansberg district there is a large area excellent for cotton culture and sub-tropical cultures such as oranges, bananas, pawpaws, pine-apples, and mangoes. Then as to our cereals. There is nothing to touch our winter apples, such as are grown in the district of Ermelo in the east and the district of Lichtenberg in the west, and apricots and plums all over the country. There is hardly any single thing in the whole range of agriculture that we cannot produce.

6. What about the quality of your land?—The lands on the Orange River are very rich. There is a country with good potentialities from Prieska down to Kakamas on the Orange River. You will find sometimes as much as 50 feet of alluvial loam in river sidepatches; land that can carry oranges, ostriches, and lucerne, but, of course, at present it suffers from want of both railways and population.

7. What is the value of the land down there?—Dry land varies from 5*s*. to 10*s*. a morgen, but for irrigable land you have to pay much more, say from 10*l*. to 30*l*. per morgen. The Government owns the land surrounding the Great Falls, now called "The Cataracts of King George."

8. Do you mean to say that the Government still demand 30*l*. per acre?—No, I was talking of private owners, but it is almost impossible to say what is the price of such land. It varies so greatly. The Government has settled a colony of poor whites at Kakamas, an account of which I have given in the "Conquest of the Desert." But there is a great deal more land all down the Orange River. Many of these lands along the Orange River are very rich lands, and these, so far as I know, are held by the Government and still undeveloped.

9. Is it not the case that large tracts of land are held speculatively for a rise, and that the present owners make no use of it whatsoever?—Yes, that is so. We live in a very speculative country.

10. I want to know if these lands are suitable for date-farming?—That is not a question on which I can speak with authority, but I read what you said the other day at Bloemfontein, and I entirely agree with you. I believe that it would be quite possible to grow dates with, say, a 10-inch rainfall, because I see that the French in the arid parts of Algiers are growing olives on a 10-inch rainfall, and I have no doubt that date-planting would be both possible and profitable.

11. What is your rainfall?—It varies from about 10 inches per annum at Prieska, in the Cape north-west, until you reach the coast in Namaqualand, where it is sometimes very low, even down to 3 inches per annum. Where the land can be irrigated it would be possible, by boring or utilising the Orange River, to utilise, by pumping, a good deal of the land adjoining the river for date-planting.

12. Does the rain fall at the time the date would come into bloom?—I do not know about dates, and cannot, therefore, answer that question.

13. I am told that there are sharp frosts there?—I do not think that the frosts in that part of the country would be severe enough to injure dates. It is a very warm country. You may think that Johannesburg is warm, but it must be remembered that the further west you go you are always getting into a warmer belt.

14. Are you aware that date-growing is one of the most profitable at the present moment. I myself have worked out the figures and I make it that the return is 50*l.* per acre per annum. Dates are the bread of the East, and there is not a sufficient supply?—I think that it is an excellent idea, and I am glad that you have brought it up. The mere fact of your coming here and impressing it upon our attention will do much good.

15. I call your attention to it and would suggest that you make a study of the subject?—I shall be delighted to do so.

16. You cannot give any figures as to the frosts in the Prieska district?—I do not think that it would be possible to get any reliable figures regarding the frosts.

APPENDIX III.

Johannesburg, Thursday, 2nd April 1914.

The following Memorandum, prepared by the Secretary of the South African National Union, was submitted to the Commission:—

(*The portion relating to Fruit-growing is printed on p.* 320.)

Maize and Cattle-farming.

As a field for maize-growing the Union of South Africa, especially the Transvaal and the Orange Free State, is, by general admission, in the front rank. The present yield will be considerably increased in the near future as the advantages of better cultivation are realised. Even now it gives the well-equipped and industrious farmer an excellent return on his capital, and the energy demanded in cultivating and harvesting the crops is not great, owing to the possibility of employing machinery for nearly every process.

As maize culture is gradually coming to be understood in South Africa, there can be no division of the heading given to this statement. Cattle farming can be profitably conducted without growing maize, but the feeding of cattle on a large scale is an economic consequence of extensive maize culture.

The whole of the high veld and other vast stretches of South Africa are endowed with rich soil. The climate is superb, and the combination of soil and climate gives conditions under which the finest maize in the world can be grown.

The remarkable recovery of agriculture after the blows dealt it by rinderpest and the war is well known to all interested in South Africa. After the war agriculture may be said to have started *de novo*, and that, too, with nothing more than the slender resources lent to the farmer by the Repatriation Department. To some extent this growth was due to that spirit of energy and enterprise in the affairs of peace which appears to seize on men after a prolonged war, and which in agriculture here found a climax in the formation of the Transvaal Department of Agriculture.

Maize culture and the breeding up of stock received an impulse which has been gaining in momentum ever since. The former was gradually worked up to supply the internal requirements of the country. In 1908 there was a surplus, not much in itself, but the event was of the greatest importance. For the first time, the country seemed to awake to its possibilities. The surplus was exported. No event before had proved so stimulating. The railways and shipping companies, till then supported largely by the import traffic, responded to the demand for return freight. Maize is now carried at 2*s.* 8*d.* per muid (of 203 lbs.) from any railway station in the Union to London.

In 1909 1,514,139 muids of maize, and meal made therefrom (mealie meal), value 665,957*l.*, were exported.

The following are the export figures for the Union from 1910 to 1913:—

	Muids of 203 Lbs.	Value.
		£
1910 - -	1,767,975	699,583
1911 - -	1,030,389	409,391
1912 - -	1,003,590	480,064
1913 - -	136,165	83,678

The export returns provide the only index as to the progress made. As there is no machinery for taking accurate statistics of acreage planted, production, consumption of maize on the farm, &c., it is impossible to prepare a statement on maize culture that is of first-class value. The establishment of a statistical bureau under the Government is now in contemplation. It is certain, however, that a greater quantity of the grain raised has, since 1911, been annually fed to stock on farms. There have been more cattle each year to feed. The feeding of ostriches during the past few years has also been an outlet. But according to the census returns of 1911, the total production of maize in the Union was only 863,200 tons of 2,000 lbs. for the year. This figure shows that a real beginning has not yet been made to exploit this great source of national wealth. The yearly production of the United States of America and the Argentine is from 90 million to 100 million tons of maize.

The root cause of this difference is in our rainfall, temperature, and rapid evaporation of moisture. These are our difficulties, not the quality of soil, which is good. Every man has to fight the climate in which he lives and meet its varying conditions. It is submitted that in this country the battle is being

waged without a proper regard to existing conditions of climate.

The rain falls during the growing season. The rest of the year is a long period of ideal harvest conditions. The crop is left standing until it is dry. The frost then gives it the best finish maize can have. It is due to its fine quality, and the fact that it is dried naturally, that South African maize is much sought after for human consumption and for manufacture.

Between the rains in summer, and especially during the long dry season, the South African sun has an extremely drying and hardening effect on the soil. The frosts in winter are not severe enough to break up the soil, and there is no snow. Consequently, during the dry months, the ox-plough has little effect on the land. When the conditions favour ploughing with oxen, the tillage cannot be done deep enough to provide the reservoir required under such rainfall and climatic conditions as apply in South Africa.

In the best maize districts the crops have to be planted in the middle of December to ensure their benefiting, and not being destroyed, by the earlier frosts. The climatic conditions that make the maize produced in South Africa the finest in the world are, therefore, the conditions that make a very large expansion of maize-growing impossible except by mechanical ploughing. The acreage put under the plough by oxen must be necessarily small and the depth not great enough. Consequently, only fractional parts of the vast areas of our fertile soil are brought into productive account, and if the attempt is made to add depth the area is necessarily still further lessened. The ideal rainfall conditions would be that showers should fall so frequently as to maintain a constant supply of moisture. Every added inch of tillage reduces the standard of this ideal. The farmer who ploughs 4 inches deeper than his neighbours talks "drought" much later, or not at all.

For purposes of comparison, maize production in America is frequently cited. But the conditions there favour animal power for ploughing. The severe frosts of winter perform all the subsoiling required, and shallow ploughing only is needed. *Here the climatic conditions demand deep ploughing.*

The need of the country is a system of ploughing that will supply our two greatest requirements, *i.e.*, deep tillage and the power to deal with a large acreage. With these the future of the industry will be assured.

Then with regard to the second feature of maize-farming, *i.e.*, the best use to which we can put the crop, reference must again be made to America. The American farmer carries his maize-farming to final results, and realises it in beef. This is the most profitable method. When he sells any maize it is his surplus of grain, which, together with the stalks, he has not stock enough to consume on the farm. His two principal anxieties are to have enough feed for his cattle and enough cattle for his feed. He understands the maize crop as so much tonnage—stalks and grain. It will be so understood in South Africa when maize culture is conducted by methods suitable to the country, although the problem of feeding cattle on the maize farm here will always be lighter owing to the mildness of the winter. At present maize is spoken of and regarded as *bagged* grain. The bagged produce is only part of the return. Statements are frequently seen purporting to be the cost of producing a bag of maize, as if it were a bag of potatoes. Although this cost is worked up to the cost per acre, the large tonnage per acre of beef-forming fodder gets no place in the account, the bagged grain only being regarded as the revenue. When South Africa is producing maize in quantities at all commensurate with the possibilities, as in America, it will not be the stalks, but the surplus grain sold off the farm that will be regarded as the by-product of maize culture.

For the greater part of the year the natural veld pastures in all the maize districts of South Africa have good stock-carrying capacity, and normally the cattle are maintained on these alone in excellent condition. No more striking proof of the limitation of maize production is afforded than that the trek oxen, when the rains commence in October, are often too poor to plough. The national loss to the country through the want of winter feed runs into an incalculable amount of money. The farms are stocked with an eye to the summer and not the winter-carrying capacity. It is the latter that will form the basis of stocking, under the conditions that will best suit South Africa. If the condition of a bullock on veld pastures up till June is maintained till October, it can be sold on a certain market at a price that has risen by at least 10*s.* per 100 lbs. There is no cheaper winter feed than ensilage, which is made from maize cut whilst at its most succulent stage, chopped up and cured in a silo under a natural process of heating and fermentation.

Experiments have been going on for a number of years to ascertain the most suitable breeds of maize for certain classes of soil, *i.e.*, those giving the heaviest yield in the shortest time. Although much valuable information on this head has already been gained, the cross-breeding of different types is being continued, and it is likely still further improvements will be made. It is now known what descriptions of maize are most in demand in the European markets and the condition in which the grain must be sent. Definite types have been agreed on and a system of grading by Government officials has been instituted at the ports. Growers now know what they have to aim at and the price more or less they will receive. But so far they have failed to realize the greater advantages of exporting their grain in the form of meat.

Messrs. John Fowler and Co. of Leeds, the manufacturers of the double engine steam plough, who have been closely identified in the most practical way with agriculture in South Africa for the past ten years, have done much to show that maize-growing and cattle-raising are twin industries and that they will probably be the largest agricultural industries of the South Africa of the future.

Some particulars of Messrs. Fowler's achievements in this connection have been kindly supplied by them and are appended hereto.* An interesting pamphlet* on this subject issued in 1909 by the railway company is also submitted.

Although the right use for maize is for feeding stock in the country of production it will probably be exported from South Africa for some years to come. In the early stage of maize production in America the bulk of the crop was sent over-sea. Now it is used for the purpose of manufacture as well as a food for stock of all kinds. A similar change will come about in South Africa, but it is encouraging to know in the meantime that a large market exists in Europe, and that owing to its high quality South African-grown maize realises 2*s.*–3*s.* per quarter above that from other places. It is now so favourably known in the markets of Europe that it is not likely grain from any other part of the world will be able to oust it from the position it has obtained. This supremacy is the result of the favourable climatic conditions that exist here. There is no rain at the time of harvesting and, consequently, the grain does not need to be artificially dried. For this reason South African maize is greatly in demand for manufacturing purposes. Up to the present it has been grown almost entirely for the sake of its grain, but it can be profitably employed for many other purposes, such as the manufacture of breakfast foods, corn flour, starch, glucose, dextrine, corn oil, cellulose, oil cake, poultry food, paper material, and whisky. Although still small, the industry has been established on a firm footing, and all that is now required is production on a scale that will enable South African-grown maize to be largely used for beef production and to take its place in the markets of Europe as one of the leading crops of the world. The absence of capital for the development of the industry on a large scale is the only reason that prevents South Africa from obtaining her share of the enormous existing demand oversea.

* Not reprinted.

Cattle-ranching in what are known as the bush veld areas of the Transvaal, in particular, where artificial feed is not necessary, is justly considered to be one of the most prosperous forms of the pastoral industry, for there is an enormous profit in stock-raised under the conditions that now exist. In the past many drawbacks have militated against the success of ranching, the absence of any railway in the neighbourhood, the prevalence of tick fever, and horse sickness and malaria. These difficulties are no longer present to any extent. The consequence is that some large areas have recently been purchased for stock-raising. In the bush veld cattle do well in most years without artificial feeding and can, therefore, be sold on the local market at very profitable rate. The local value, say, 32*s.* 6*d.* for 100 lbs., is low compared with European values, but the cost of production is far less. The demand of the South African markets is now so considerable that a very large expansion of cattle ranching is justified, in view of the fact that all the artificially-fed meat can be exported.

There are, in the Transvaal in particular, considerable areas that can be obtained at very moderate prices, because of their unsuitability for much else than stock-raising. It is the purchase of such land that is recommended for cattle-ranching where maize or other feed can be done without.

Maize-growing for export, or in conjunction with cattle-breeding, or cattle-ranching simply, have an unlimited future in South Africa. The possibilities of the development of agriculture in these directions are far greater than any that have taken place in the mining industry, enormous though that has been. There are few schemes that present better opportunities for obtaining a sound industrial investment than maize-growing and cattle-raising in South Africa.

Mr. J. Van Zijl, of White Ladies, Orange Grove, a member of the Union, who was examined with reference to the memorandum by a committee consisting of Sir Rider Haggard and Mr. Garnett, was not wholly in favour of mechanical ploughing on the ground of the greater liability to damage of the plough. He was also more in favour of the export of maize than of keeping it to feed cattle. He endorsed the views stated in the memorandum as to the future of the Transvaal and the Orange Free State as a field for maize culture and for cattle-ranching.

APPENDIX IV.

Returns furnished by Mr. J. B. Moffat, Director of Census, and formerly Secretary of the Economic Commission. (*See* Question 5535, p. 251.)

APPENDIX V.

Memorandum by Mr. JOSEPH BURTT-DAVY, F.L.S., F.R.G.S., F.R.H.S., F.R.C.I., F.R.Soc. Arts, Botanist, Transvaal Maize-breeding Station, Vereeniging; lately Government Agrostologist and Botanist, Union of South Africa, on

South Africa as a Field for Maize-Farming.

IMPORTANCE OF THE MAIZE CROP.

I think it is not generally realised that the world's consumption of maize is greater than that of wheat,* while it takes only one-half of the acreage laid down to wheat to produce the same yield of maize. At the same time the foliage of the crop yields an enormous amount of highly nutritious stock food. It is claimed that there is no farm crop grown which produces a heavier yield of stock food than maize.

The importance of this crop as a source of food for man and his domestic animals, and also as a source of supply of commercial alcohol, starch, glucose, dextrine, and other commercial products has been described at length in my book on "Maize, its History, Cultivation, Handling, and Uses" (London, Longmans, Green and Co., 1914), so that I need not burden this memorandum with further details on this point. It will suffice to point out that the world's consumption of maize is about 1,100,237,180 muids (of 200 lbs.), *i.e.*, 3,928,947,000 bushels; of this the European Continent absorbs something like 43,200,000 muids, and the demand is constantly increasing as new uses for the crop are being found. The European markets are at present supplied chiefly from the United States and Argentina. The local consumption of these two countries is steadily increasing, and their surpluses are decreasing, while the European markets are looking out for other sources of supply. The climatic conditions which control the distribution of the maize crop are such that there is practically no area of any size, of suitable land, left in the United States and Canada fitted for maize-growing.

At present the whole of the African Continent produces only about 1 per cent. of the total world's production, while the United States of America contributes 75 per cent. But there is no reason why we should not contribute a much larger percentage; in fact, as a field for maize-growing, British South Africa is the most suitable and most promising undeveloped area of equal size in the whole world.

We have an ample average rainfall, at the right season of the year, and phenomenally favourable winter weather for the natural production of the quality of grain most suitable for shipment, whereas the Argentine is always hampered by her autumn rains, which often seriously damage the crop. Owing to the dryness of the winter over the greater part of South Africa, the farmer is able to continue harvesting and shelling in the field up to the very day when he starts planting the new crop; in this respect he has an enormous advantage over the farmer in either North or South America. The percentage of grain which is damaged by the weather is exceedingly small; the moisture content of the grain exported (without artificial drying) is some 5 per cent. lower than that of the American-grown article. South Africa has, and is likely to have for many years, an excellent local market for a large part of her crop, the Rand Mines alone taking over 750,000 muids per annum. Because she owns her own railroads she can carry her surplus to the coast at cost. With this great advantage in her favour, South Africa has good reason for optimism as to the future of her maize industry. There is good ground for the prophecy that South Africa is to become the maize granary of Europe.

Our present average yield is low (not over four muids per acre), but good farmers are producing an average of 20 muids (72 bushels) of maize per acre, and I expect to see still better yields as our maize lands get into better "heart," with more humus in the soil. The present low average yield is considered to just about cover expenses of production; if the yield were more than doubled, therefore, maize-growing should pay handsomely.

I believe that the Transvaal alone will be able to, and will in the near future, produce without difficulty 35,000,000 muids per annum.

Maize will always be the staple cash crop of South Africa—as its value for stock food becomes better appreciated the local demand will increase, and in this connection Earl Grey's recent prophecy (at the "South African Dinner," 1913) of a coming shortage of the world's beef supply is suggestive. Maize and cattle-farming go hand in hand.

We exported 1¾ million muids in 1910.

MACHINERY.

There is a good and rapidly growing market in this country for maize-growing implements, such as are manufactured in the United States and Canada. Also for "shellers," nearly all of which come from

* Actually 147,000,000 bushels more.

England. Reapers, shockers, and binders are not yet much in demand, but the demand will grow as the farmers get more capital to spend on implements. Nearly all our maize planters and cultivators are made in the United States. Every year the merchants *under-estimate* the demand for planters owing to the astonishing increase in their use, and in the acreage put under crop. At the beginning of the planting season it happens year after year that you cannot get a single planter of certain favourite makes at any place in South Africa. I know one small country firm which sold 52 maize planters in one season, which was more than they had sold in the preceding seven years! This should give some idea of the rapid progress being made. There is great need for a smaller and cheaper husker and sheller.

The preparation of maize silage is steadily on the increase, and the demand for silage-cutters and for shredders is keeping pace with it. These facts should be brought to the notice of English, Canadian, and Australian manufacturers.

Bulk Handling.

If the Government would take its courage in both hands and adopt the bulk-handling of maize as so ably recommended by Sir Thomas Price in his Report of 1911, it would give a great impetus to the export trade. (*See* addendum below.)

I am fully alive to the fact that it is better to make our maize walk to market on four legs than to export it in the form of the raw article. This, however, must come naturally with increase of immigration, smaller holdings and increase in dairying and pig raising. In the meantime and for many years to come local production will be greater than consumption, and the export trade will benefit the agricultural community by bringing capital into the country.

Direct Shipment.

Our maize trade would be in a much better position if we had direct shipment to Liverpool, Manchester, Waterford, and Glasgow; at present nearly all our grain is sold through London, and transhipment to those ports adds to our costs what might otherwise be gained by the competition of these markets to secure our grain. The merchants at these ports are very anxious to handle our maize. With the ports competing it seems to me probable that our trade would be diverted from the Continent, which now consumes more than Great Britain. London brokers admit that theirs is the cheapest grain market in the world, and as long as we are solely dependent on them we cannot secure such good prices as would be the case if we could ship direct to other ports.

I believe that it would be greatly to the advantage of both South Africa and the other Dominions of the Empire if the commercial bodies of the latter could be made aware of the fact that South African maize is the best in quality and condition of any produced in the world. An export trade with Australia has already commenced. I think India might take large quantities of our maize in exchange for the more expensive articles of commerce which she produces and we do not. The climatic conditions of Canada do not allow her to produce more than a fraction of the maize which she requires for manufacture and stock food, and I understand that the direct lines of steamers between Cape Town and New York and Canadian ports could carry our maize for less than the charge on some 1,500 miles of rail over which United States maize is carried from the "Corn Belt" to Toronto, Montreal, or Quebec. Egypt also, though a producer to some extent, is also a buyer of maize, and we might perhaps secure her trade if she knew what we produce.

We can produce maize probably more cheaply than Australia, India, or Egypt, because it is grown on relatively cheaper land—land which is much cheaper than that of the "Corn Belt" of the United States of America. Land in India and Australia suitable for maize-growing is too valuable because it can produce other and more expensive crops, which we cannot produce on our maize lands.

Teff-grass.

I think it is highly important that the other parts of the Empire should become acquainted with the value of teff-grass (*Eragrostis Abyssinica*) as a source of hay. I published articles on this subject in the *Agricultural Journal of the Union of South Africa* and in the *Kew Bulletin* a short time ago, but these publications are scarcely likely to reach the notice of farmers in other parts of the Empire. It is a known fact that the introduction of teff into South Africa has raised many small farmers from positions of penury to comfort and independence. Our farmers admit that this introduction alone has repaid over and over again the whole cost of the division of botany of the Department of Agriculture from its inception to date.

Need for more Farmers.

The land is crying out for men—capable trained farmers with 1,000*l.* to 1,500*l.* capital. Opposition to immigration is passing away. At our Transvaal Agricultural Union Congress now meeting a resolution favouring immigration was passed on the evening of April 2nd, the first time in the history of the Union that we have been able to get such a measure through. We need good farmers—of the yeoman type—from England and Scotland. For the development of the low country, where cotton, tobacco, and sugar-cane can be grown, we need a few hard-working settlers from the States, accustomed to cope with malarial fever and therefore not afraid of it.

Profits in Farming in the Transvaal.

I doubt whether there is at the present moment any country in the world where capital put into the development of agriculture can be so rapidly doubled as in the Transvaal. I know a case where a young man *cleared* 1,500*l.* the second year of farming on the Transvaal high veld. I know other cases where farmers have bought their farms outright after paying rent for six years, and in the meantime have completely fenced, camped, built farm buildings and houses, and got together herds and flocks, besides planting shade trees, windbreaks, and orchards, and have lived plainly but comfortably on the proceeds of their farms. In three such cases the men started with only 1,500*l.* capital and paid 90*l.* per annum rent. Their crops were maize (the staple), potatoes, and teff, and they supplied milk to Johannesburg, about 100 miles distant.

We have excellent land, as cheap for its potential value as any in any other healthy part of the world; as fine a climate as any in the world, where our men and our stock can work on the land from one year's end to the other; we have excellent railroad service, low export rates, and an assured and growing market for all the maize, meat, and wool we can produce.

Addendum.—We use 2½ lbs. "A" twill, jute grain-bags, imported from India, for the export trade, and "B" twill for the local trade. The cost of these bags to the consumer has increased 100 per cent. in the last five years, and this fact may force us to adopt bulk-handling. Indian manufacturers would be well advised to consider this point and to try to keep our grain-bag trade.

Vereeniging, April 4, 1911.

(b) Cotton.

CAPE OF GOOD HOPE.

Cape Town, Thursday, 26th February 1914.

Mr. Laurence Woodhead called and examined.

(*For the evidence of this witness on "Fruit," see p.* 315.)

5726. **(Sir Alfred Bateman.)** I think you have sent in a statement to the Commission ?—Yes, I understand you desired to have some information about cotton.

The statement is as follows :—

For the seasons 1910–11 we supplied some farmers with cotton seeds, namely Metafife, Nyasaland, and American Cleveland. The ground upon which the seed was sown was situated mostly in the Clanwilliam and Piquetberg districts. I gave the farmers full instructions in regard to planting, but only in a few instances were these instructions carried out. The fact remains, therefore, that the results were very disappointing, as in addition to the usual pests, there was an absence of vitality in the growth that seemed to indicate the non-suitability of the soil and climate for cotton-growing. Mr. Scherffius, Pretoria, the Union expert, visited the district at about the time the crop was growing, and was not impressed with the possibility of success being attained. I may say that Mr. Rowarth, Cape Town, who has had considerable experience in cotton and cotton-growing, visited several of the farms during the season in the hope of creating enthusiasm amongst the farmers, but without success.

The small quantity of cotton returned was sent to Messrs. Dyer and Dyer, of East London, to be ginned, with the following result :—

Lbs. of Cotton.	Net returned ginned.	Return of Cotton Seed.
2,040 lbs.	715 lbs.	1,281 lbs.

The ginned cotton was shipped to the Manchester Cotton Growing Association and realised 7·33*d.* per lb.

This season I have addressed farmers in regard to a further experiment, but they are disinclined to trouble further about it.

5727. You have had only local experience, I understand ?—Yes.

5728. You would not like to express an opinion on the prospects generally of cotton in this country ?—No.

5729. **(Mr. Garnett.)** Can you tell me on what acreage that 715 lbs. of cotton was produced ?—No, I could not say.

5730. Because on the face of it it looks as if the scale was not considerable ?—No. It was obtained from quite a number of farmers.

5731. And in addition to the apparent unsuitability of the soil you seem to be troubled with pests ?—Yes.

5732. The price realised was not bad ?—No.

5733. It is not produced commercially ?—No.

5734. **(Mr. Campbell.)** When you supplied the farmers with cotton seeds, did you act only as a providing firm ?—Yes.

5735. You did not act in connection with the British Cotton Growing Association in England, did you ?—No.

5736. Then it established the central ginnery in this country, I believe ?—Yes, it was at East London.

5737. And it has been abandoned, so I understand. They have handed it over to the Government ?—Yes, I think so. As a matter of fact Mr. Jagger himself imported a small gin for this district which we have not used on account of the small return of the cotton.

5738. Are these gins not used at all ?—Those at East London are being used. We have not used ours here.

5739. Do you know anything about the recent experiments in Pondoland ?—No, I do not.

5740. Was that done by the Department of Agriculture ?—I do not think so.

Cape Town, Thursday, 5th March 1914.

Mr. Frank Braybrooke Smith, Secretary to the Department of Agriculture for the Union of South Africa, called and examined.

(*For the evidence of this witness on "Land Settlement," "Animal and Agricultural Produce," and "Fruit," see pp.* 9, 176, *and* 318.)

5741. **(Chairman.)** Have you anything special to say in regard to the cultivation of cotton ?—No, we are experimenting with it. In some cases the experiments have been very promising, but it has not yet become a staple crop like mealies or tobacco, although this year, owing to there not being a good sale for tobacco in the Rustenburg district, a great many of the farmers have changed from tobacco to cotton.

5742. What is the total export of cotton from South Africa ?—A very small number of bales. It is not a commercial quantity at the present time. The development of cotton cultivation in this country is a question as to whether the land is suitable and whether sufficient labour is available at a suitable price. The first trouble is that the plant is delicate and difficult to get established, and if we get a drought just when the plant comes up or a very severe wind the drought wilts it, and the severe winds bring sand across the crop and cut it off and then, again, unfortunately, the cotton districts are rather bothered with hail. We have not got the consistently good economic and climatic conditions which exist in other parts of the world, but we have got fair conditions.

5743. Is there sufficient labour for picking the cotton available, or is that likely to prove a difficulty ?—We hope that we may be able to get it established in the neighbourhood of the native locations so that we can get the help of the women and children to pick it, but we have not succeeded up to the present.

5744. **(Mr. Campbell.)** Were not some experiments conducted in Pondoland last year ?—Yes.

5745. Successfully ?—Yes, the plants were grown in very rich and sheltered valleys on good soil.

5746. Is there any quantity of that land ?—No, not large quantities.

5747. Do you think that is a wise experiment ?—Local people who did it thought so. We gave advice and they carried out the experiments. As a matter of fact I think it would pay the men who tried the experiments well.

5748. Where were the experiments conducted by the Cotton Growing Association?—Mainly in the northern part of the Transvaal—the Zoutpansberg.

5749. They were not successful?—No.

5750. Were not some tried near East London?—Yes. But there, unfortunately, the ground was not well chosen either. It was the very reverse of the ground in Pondoland. It was high, wind-swept country, and the plants were blown away.

5751. Does the Agricultural Department intend to continue the experiments?—Yes, we are making experiments at various stations. We have one at Rustenburg, one at Barberton, and one at Tzaneen; also at Piet Retief in the Transvaal.

5752. **(Sir Jan Langerman.)** In regard to the cotton-growing experiments, could not the Zoutpansberg and the Waterberg and the Tzaneen Estate carry cotton profitably?—I think so. Our experiments have been satisfactory on the whole.

5752*a*. There would be room for people to take up land for cotton?—Yes.

East London, Monday, 16th March 1914.

Mr. N. F. Howe Browne, B.A., Cotton Grower, called and examined.

5753. **(Chairman.)** I understand you are interested in cotton-growing?—About eight months ago I arrived here after serving an apprenticeship in the United States, Texas, the West Indies, and Egypt. I spent about two months in Manchester and got an insight into cotton-spinning through the assistance of the British Cotton Growing Association. I came out here under the auspices of Mr. H. E. V. Pickstone. I started on a motor bicycle to tour the country from Humansdorp to Durban. We wanted to keep near the coast for various reasons, one being to save railage. I eventually chose a place about 28 miles west of East London, where I am at present, and I put about 60 acres under cotton. I cannot give you any details as to what the crop will be like because I have not yet reaped a crop. But the cotton is looking exceedingly good and the growth is satisfactory at present, and it is well fruited. It is looking particularly good considering the adverse conditions it has had to contend with this season. You will no doubt be aware that we have suffered very much from drought in this country this past year, and farming generally is not looking at its best. But the cotton is holding up splendidly and I hope to get a fairly good crop. As regards the climatic conditions which have to be met with, we are greatly worried with winds, but that is a disadvantage that can be combated. We ought to do well also in regard to labour, which is one of the chief difficulties in regard to cotton-growing throughout the world. Cotton is a crop that requires a certain amount of skilled labour. I have found up to the present very little difficulty in that respect, although I have not had the experience of actually gathering a crop yet. As regards the climate, I like this spot, first on account of its rainfall, which is sufficient, and more than sufficient, for a good cotton crop. We average about 34 inches a year, and that is ample; secondly, I like this district because there is a very long growing season. We have practically no frost and I think I am right in saying that we can estimate a ten month growing season for the cotton, whereas in the States the crop has to be planted, grown, and gathered within seven months, and those conditions favour the growing of an extra long staple cotton, which I understand is what the spinners in Manchester and the general English trade desires to have. That is what they have aimed at in Egypt, growing a longer staple. The best cotton which has been grown in this part of the world has generally realised a longer price in London than the average American cotton has done. I do not know that there is very much else that I can give you. I cannot give you any figures, as I have not been here long enough to gather a crop, but those are my impressions as regards the average conditions round here.

5754. Is the area on which you are now cultivating cotton the best of all you saw in South Africa?—Well, no, it is not the best. I consider that the great cotton-growing area along the coast is in what are known as the Native Territories. I think that they are, if anything, more favourable to cotton-growing than this district. But the white man is debarred from getting a holding there. I mean the Transkei and Pondoland. That is along the coast between here and Durban. Of course, the Government is trying to introduce cotton there and some people at Port St. John's have done exceedingly well. The Government expert was at Port St. John's a month ago and he came back and told me they were going to gather a crop realising two bales to the acre, which is very nearly four times as much as the average grown in America. That would be 1,000 lbs. of lint cotton to the acre.

5755. Where is that place precisely?—Port St. John's is 200 miles up the coast from here.

5756. Has that been grown on Government land?—No, it has been grown by some people called Wardlow and Kirsten who have a trading station there. These trading stations, I understand, are limited to about 15 to 20 acres, and throughout the territories a white man can only get a trading station if he is five miles away from any other trading station. So one is debarred from getting a site there. That is the spot I should like to have chosen, but I consider the place which I have is well adapted for cotton-growing.

5757. Speaking generally, would you say there is a large area suitable for cotton-growing?—I would not like to say there is an exceedingly large area, but I think that every farm which I have seen has some land which could grow a very long staple and high-price cotton.

5758. Your idea is that a small portion of the farm should be devoted to it?—Yes.

5759. **(Mr. Garnett.)** What acreage have you now under cotton?—I have about 50 acres.

5760. What is the character of the soil, is it well adapted for cotton?—The soil on my farm is a deep alluvial soil. I would not like to say how deep it is, but it is river-bottom land of fair richness.

5761. What preparation did you give the land before starting? What had it been growing before?—Before I started it had been growing weeds and ostriches. I had a very up-hill fight and I do not by any means consider that the crop which I have now has had a fair chance as a cotton-growing proposition. We had every kind of pest and every kind of weed to get rid of, which had been allowed to grow there for twenty years.

5762. You have not had it thoroughly cleaned yet?—No.

5763. What preparation did you give it?—I started off by ploughing the land over twice. I harrowed it well and planted a crop with a two-row planter, a machine which is used in America, and I cultivated it with a disc cultivator, also an American machine.

5764. To what depth?—The cultivation was only to a depth of about 1½ to 2 inches.

5765. What depth did you plough?—I ploughed 12 to 13 inches.

5766. Did you give it any manure?—I have not put any manures on the ground, and I do not believe it is necessary to do so. I think the soil is quite rich enough at present.

5767. Can you tell us the cost per acre, or the gross cost?—No, I would not like to commit myself to any figures as to cost, but I can tell you that the expense

this year is infinitely greater to what it will be in future, on account of the weeds which we had to get rid of

5768. You have had all the pioneer work to do?—Yes.

5769. You could not tell us what the costs are then?—No, I prefer not to do so yet.

5770. You say you have plenty of labour?—I have found ample up to the present.

5771. Do the natives take kindly to it?—Yes, I get all I want.

5772. What do you pay your labour?—The boys who live on my farm receive 1s. 3*d*. a day and they find themselves. The boys who come to the farm to work get 9*d*. a day and their food, that is those who come from the big native locations in this district. Their rations would cost about 3*d*. a day.

5773. Have you to house them?—No, they have huts on the place. I have not built them and I have had no expense in that way.

5774. But you really find them accommodation?—Yes, I suppose I do. But on the other hand, the huts do not cost the owner anything. The Kaffir always builds his own hut, and you could not put a white man into it, so I do not think you could put that accommodation on the expenses account.

5775. What varieties of cotton have you put in?—I have put in Allen's long staple seed, which the British Cotton Growing Association got for me, and I have also a small experimental patch of some stuff from South Carolina.

5776. What is the characteristic of Allen's staple cotton?—It is a long staple Mississippi Valley cotton grown round about Memphis.

5777. Is it Bender's?—It may turn out Bender's but I cannot say yet, I hope it will.

5778. Have you tried any Egyptian?—No, I have had three lots of Egyptian cotton given me in Liverpool, but I have not sown any this time although I hope to get the ground ready and put it in next year.

5779. What is the length of staple that you expect you will get from those varieties you have put in?—I think Allen's long staple ought to give 1⅛.

5780. That is a very valuable cotton?—Yes, I can only say that judging by a few diseased boles which have opened prematurely. I do not expect my general crop to open for another six weeks.

5781. You have put in these varieties on the advice of the British Cotton Growing Association?—Yes.

5782. From information which you supplied to them?—Yes.

5783. Do you think that those varieties would be the best economically?—Well, the British Cotton Growing Association have carried out these experiments very extensively and they find that this variety holds up better under foreign conditions than any other kind, and in Nyasaland it has developed a new type which is known as Nyasaland Upland, which was nothing but Allen's long staple cotton originally.

5784. You say you have a rainfall of about 34 inches in this district. How is that rainfall distributed?—It is well distributed over the year. June, July, and August is the time when we get our lowest rainfall. Most of it is distributed over the other nine months at the rate of practically three or four inches per month.

5785. When is your planting season?—That is a question which is a very open one. I planted my cotton this time in October. General Brabant advised me to plant before that, in the middle of September, and a good many years ago people used to plant a lot of cotton in these parts in June, which shows you the length of our growing season. It is quite possible to plant in June and I know the seeds will germinate.

5786. How is your rainfall as regards preparing the land. I understand you want the land fairly dry for ploughing, do you not?—I do not think we get too much rain at ploughing time.

5787. After the seed has been put in, your rain comes at a seasonable time?—Yes. The cotton seed has been known to remain in the ground for a month waiting for rain and then to germinate.

5788. You have no frosts?—I do not think so. I have not been here a year yet, but they tell me not.

5789. Then there is nothing practically to arrest the growth of the plant until its natural exhaustion?—No. They tell me it is better to leave the plant in the ground and that the second year is better than the first.

5790. I suppose you know that the British Cotton Growing Association does not favour that ratoon cotton?—No, and I do not like it myself either. But one must give some attention to local experience.

5791. Then as you have no killing frosts there seems to be nothing but the natural exhaustion of the plant to prevent boles forming?—That is all.

5792. I understand that in America if they have a mild autumn and an open winter they go on picking into January?—Yes. The only limit to their picking is the amount of labour they have.

5793. In regard to this experiment at Port St. John's, how many acres have they?—I understand about 15.

5794. How long has this experiment been going on?—They started early last year. I know a firm in this town, Messrs. Dyer and Dyer, ginned their cotton and sold it in England for them and got a very high price in Liverpool.

5795. They have not grown it on a large scale yet, I understand?—No, they cannot.

5796. There is no big plantation there nor a large number of these small patches?—No. I believe that Wardlow and Kirsten are the only people who have the land. A white man is not allowed to get a holding there.

5797. Did you say you sent your cotton to London or Liverpool?—It has all been consigned to the British Cotton Growing Association in Manchester.

5798. It would be sold then either in Liverpool or Manchester?—Yes.

5799. **(Mr. Sinclair.)** In regard to the native areas, which you tell us are not available to white men, can you say, roughly, what area of ground there is available in that locality for cotton-growing?—No, I could not give you that information.

5800. Could you tell us what area you covered yourself when you were looking for a suitable place?—I covered all the land between Port Elizabeth, or Humansdorp, to Durban.

5801. And having covered all that ground I take it we may assume that the locality you selected was the most favourable for your purposes?—Yes. You must understand, however, all the time that I could not go to the Transkei or Pondoland.

5802. Can you give us an idea of the cost price of land such as you have selected?—The land I have selected cost 3*l*. an acre.

5803. Is there more of it available?—Yes, there is more land available, but I may tell you that the price is going up in this part of the world.

5804. When you say that more land is available, does that mean in any considerable quantity?—I do not think you are going to have a very large quantity of cotton grown in this district.

5805. I want to know whether the growth that may be looked for is only small or whether it is likely to expand into an important industry?—I am only talking about the East London District. In the district of King Williamstown there is also a great deal of land very suitable for cotton-growing.

5806. Can you give us an idea roughly?—No, I cannot, because it would be only misleading, but I know that every farm in this locality has at least 10 acres of land which could grow a very good cotton.

5807. How many farms where the experiment is being tried are there in this district as far as you know. I want to know to what extent the experiments are being carried on?—I am practically the only one in this district who is growing cotton at all on a commercial basis at the present time.

5808. What would you suggest as the reason for that?—I suppose the first reason is that a great many years ago people did grow cotton in this district when the price was good, and then when the price went

down they gave it up. I think that was the main reason.

5809. Have you any knowledge as to the success that attended the attempts to grow cotton?—One can only go by hearsay. They all tell you that the cotton flourished splendidly.

5810. And it was a mere question of the market price?—Yes.

5811. Is there any instruction given in this district, so far as you know, by the Government in cotton-growing?—Not that I know of. Recently, within the last two months, a cotton and tobacco expert, a man who combines the two offices, has been located in East London by the Government, and I take it that he will give all the advice that a farmer will want.

5812. You had your own experience?—Yes.

5813. I was thinking of those who have not experience. They would have the assistance of this expert?—Yes.

5814. To make a start, is much capital required?—No. I do not think so. I think it is within the means of every farmer in this district to plant a certain amount of his land with cotton without costing any more to grow than the crops he is growing at present, such as mealies.

5815. You suggest he should grow it as part of a mixed system of farming?—Yes.

5816. And you think that is the best use to which such land could be put?—Yes.

5817. **(Mr. Bowring).** Are the farms about here of very large acreage?—As far as the general farms in this district are concerned, they are not of a large acreage. Of course, lots of farms in this country run up to 20,000 or 30,000 acres, but the one I am on is just about 1,000 acres, and I do not think there are any agricultural farms in this district with a very large acreage. Of course, there are grazing farms which are bigger.

5818. Your statement then that each farmer has at least 10 acres suitable for cotton does not mean a large percentage of the whole?—No, that is quite a conservative estimate.

5819. But each one has some land which is suitable?—Yes, I am sure.

5820. Some time ago cotton-growing was quite common in this country, I understand?—That is a good many years ago. It was during the time of the American Civil War, I take it, when the price of cotton went up very much that cotton was grown in this district and in the adjoining district of Peddie, and apparently it did very well. The farmers who have lived here a number of years tell you that one of their principal jobs as boys was cotton-picking.

5821. And cotton-growing was stimulated on account of the scarcity during the war?—Yes, on account of the high prices.

5822. And after that?—The price went down and they gave it up.

5823. What induces you to think that conditions are better to-day than they were then?—Prices are higher.

5824. Is there a greater demand?—I suppose there would be a greater demand. The main point is that prices are higher. I do not suppose that climatic conditions have changed at all. If you can grow cotton to-day and get 10*d.* a lb. for it, whereas formerly you only got 4*d.* after the time of the Civil War in the United States, that would seem to be a sufficient inducement.

5825. But the market conditions are the same for them as for you. The competition is just the same now as it was then. What makes it better to-day to grow cotton in South Africa than in the days of the war?—I think simply the price. I think that is the only reason one can give.

5826. There were no diseases then or pests that destroyed the cotton?—No, not that I know of. Of course, I am talking of a time of which I know nothing personally. I am simply going by hearsay.

5827. But you can only judge as to your future success by what has happened in the past, and I was wondering whether any pests destroyed the cotton the same as in regard to the cattle?—No, I do not think so.

5828. And if they did so whether you would not find the same trouble?—No, I do not think so. Mr. Taylor was down here from the Transvaal during the recent East London Agricultural Show, and he is in charge of cotton-growing in the district of Rustenberg, and he tells me they have encountered absolutely nothing up there of that sort, and there is nothing down here which is at all serious. We do get the ordinary aphis, but that is only a tiny insect and does not do a great amount of harm.

5829. It is more or less under control?—Yes.

5830. You take steps, I suppose, to keep all these things back as far as possible?—Yes, naturally.

5831. So there is no reason why you should not grow cotton with a great amount of success?—That is so.

5832. **(Sir Rider Haggard.)** Do you know Uganda?—No.

5833. I understand that cotton grows there to a large extent?—Yes, I believe so. I understand they expect big things.

5834. They have a prospect of an enormous increase?—Yes.

5835. Do you think from what you know of this climate and the conditions generally as regards the soil and the labour and so forth that you will be able to compete with Uganda?—It is a difficult question, this question of competition in regard to cotton-growing. But we believe we shall find a market for our cotton and a fair price, so I do not think we need worry about what other people are doing.

5836. You do not think that Uganda, with its enormous prospective production, would have the effect of underselling you?—One can only take the case of the United States. They produce most of the cotton, and their average crop, I suppose, would be 13,000,000 bales of 500 lbs. each every year, and it does not make the slightest difference to them whether Egypt has a bigger crop or India or anywhere else. It is simply a case of supply and demand.

5837. What is the price of planting cotton per acre, the price of growing the crop in this part of the world?—That is a question which I have been asked before, but I do not like to give my opinion because I have not had a fair trial.

5838. How does it compare with other crops which are grown in this district?—I do not think the actual growing of the cotton crop would be any more than growing a mealie crop, the bigger expense would come in gathering it. Of course the gathering of your cotton is the big problem all over the world where it is grown. It is the same in the United States. The growing of the cotton and bringing it to maturity is not a difficult matter. It is a hardy plant. It is the actual gathering of the crop which is the problem. A great many people in America have been for a long time trying to perfect a machine for picking it but they have not managed it yet.

5839. That is a problem you will have to take into account?—Of course, we have down here a large native population which would have to supply the labour for picking this crop. I was interested in asking Mr. Taylor from the Transvaal how they managed up there, and he told me they had very little difficulty at present getting their cotton picked by the natives. In this country it is practically impossible to get natives to do piece-work. Now cotton-picking is essentially a piece-work business. The man is paid so much a lb. or 100 lbs., and the way they got over the difficulty in the Transvaal was to get a few native girls and give them a bag which would contain about 60 or 70 lbs. of cotton well pressed down and to pay them 1*s.* if they brought that bag full of cotton the same night. Well they finished about 4 o'clock and received their 1*s.*, which was very good pay, because a native girl only gets as a rule 6*d.* a day and her food. They had no difficulty in getting as much labour as they required. And that is what we propose to do also when our crop is ready.

5840. Now about the land. I think you said you gave 3*l.* an acre for it?—Yes, that is right.

5841. Supposing you were to establish this cotton-growing experiment in such a fashion that its success was beyond doubt, is there plenty more land to be had at a reasonable figure on which it could be grown ?—I think so. I think there is plenty of land which could be had at a price at which cotton could be grown at a profit.

5842. We have found in other parts that the moment a thing is a success the price of land becomes impossible ?—Most of the other industries in South Africa are devoted more or less to pastoral pursuits, sheep, cattle, and ostriches, where very little labour is required. Cotton is something which wants a lot of labour and hard work, and I am afraid that a good many of our rural communities do not like that.

5843. You think that owing to this necessity for supervision and labour, and general intelligence, the land suitable for cotton-growing would not be increased to such a price as the ordinary grower could not afford to pay ?—No, I do not think so.

5844. And, therefore, if you can show that cotton is really a profitable crop here there will be nothing to prevent any number of persons with moderate capital taking it up ?—That is my point. You could never have large cotton plantations in this country as they are known in America, but you can have plots of from 10 to 50 acres.

5845. Why could you not have large plantations ?—The country does not lend itself to them. It is too hilly. There is not enough level ground.

5846. You would grow this cotton on the level pieces of ground in the district ?—Yes. The cotton belt in America is one long stretch of flat country from Carolina to Mexico, practically.

5847. This would mean that you would have to have a number of people with more or less skill to carry on this cotton-growing as a national industry ?—Yes. As regards the United States I may say that they are finding that the big cotton plantation is not the one that pays the best. It is the smaller one where the man simply grows some cotton for ready cash.

5848. Do you think that all these people will be forthcoming ?—I think that all the farmers at present in this district could grow a certain amount of cotton.

5849. But would they ?—I do not see why they should not if it is a paying proposition.

5850. But you said it is a thing which would require much attention and hard work, and that is not agreeable to many in this country ?—But I was thinking then of those people who go in largely for ostriches, sheep, and cattle.

5851. You think outside of those there is a large class of people who would be willing and anxious to take up this industry ?—Yes, people who would work if they had something to bring money in.

5852. **(Mr. Campbell.)** Do you get any help from the British Cotton Growing Association ?—I have personally had a great deal of help from them in so far as they did what they could for me in England and Egypt, but at present out here we have no aid.

5853. You do not get any monetary assistance ?—No.

5854. Any guarantee of a fixed price for your cotton ?—No.

5855. Would it be of any assistance to you if you had such a guarantee ?—I think it would.

5856. How do you manage about ginning your cotton ? Do you have to use your own machines ?—No, there are two gins in East London.

5857. Are those the two that were brought here when the British Cotton Growing Association tried their experiments and failed ?—Well, they are now owned by Messrs. Dyer and Dyer of this town. I cannot tell you where they obtained them from.

5858. Was it in this district that the British Cotton Growing Association conducted its experiments ?—I do not know.

5859. You do not know where that machinery came from that is here now ?—No.

5860. Usually speaking, where cotton-growing is carried on on an economic basis it is ginned at central ginneries ?—Yes.

5861. Very few people employ their own machinery ?—Very few.

5862. Is cotton-growing a business that the natives would go in for on their own lands ?—I do not believe the native would grow cotton in this district. He has very little land that he could grow it on. The natives here are divided up among the farmers, and are living on the farms throughout the district. The only way they could help cotton-growing is by working for the men on whose farms they are living. There are no actual native farms about here that could grow cotton.

5863. Do you think the native is a man who would go in for a business that required steady labour and application ?—I think it is very much a case of development.

5864. I understand the Government is carrying on experiments in Pondoland, where the land is almost entirely in the hands of the natives ?—Yes.

5865. The natives would be of very little use for carrying on cotton-growing in Pondoland ?—Yes.

5866. And therefore it is much better to carry it on here ?—Yes, where the white man is doing the work.

5867. Does the South African Government give you any assistance at all ?—Only in so far as they have an expert in East London at present.

5868. They do not offer any bonus on growing cotton ?—No.

5869. That is done where cotton is started as a new proposition, pretty generally, is it not ?—I do not know.

5870. I think you said you had served an apprenticeship in cotton-growing ?—Yes, I went on a big plantation in Texas.

5871. Do the plantations in Texas use white labour or native ?—Both.

5872. But the bulk of the labour employed in Texas, I believe, is white labour, is it not ?—Yes. That is why I went there, because I wanted to do the work myself. I preferred it.

5873. Do you see any difficulty, provided the stigma on manual labour were removed, in growing cotton here with ordinary-priced white labour ?—No, I do not.

5874. At present you do not anticipate any difficulty in getting native labour ?—No.

5875. Even if the industry were carried to as large an extent as possible ?—No, I think we have plenty of labour.

5876. I think you spoke about the possibility of ratooning your cotton and allowing it to go for two seasons. Do you think in this country, where pests have such a very bad reputation, it would be a wise thing to do ?—To tell you candidly, I do not like it, and I do not want to do it unless I find it pays.

5877. I understand that where they have attempted cotton-growing for any length of time, especially on the east coast of Africa, they have had to contend with the boll worm ?—Yes, but I no not know that it is as bad as in America.

5878. It has been a difficulty in some parts of the east coast—in Nyasaland ?—Yes.

5879. **(Chairman.)** When will your crop be ready to commence picking ?—I think in about six weeks.

5880. Will not that be rather late. Will not it land you into the cold weather ?—I do not anticipate much cold weather. The weather here will not be any colder than in the States. They pick cotton right through to the end of November until the very sharp frosts. I may mention that I have been out picking when it was so cold that the fingers would bleed.

5881. Would you please give us the name and address of the people who are making the experiments at St. John's ?—Certainly. The name of the firm is Wardlow and Kirsten, Port St. John's.

5882. I understand there have also been experiments in the Transvaal ?—Yes, there is quite a lot of cotton there now.

5883. Is that under the direction of the Agricultural Department ?—Yes. Mr. Taylor, who is in charge of it

told me he was going to make a success of cotton-growing in that country.

5884. I suppose he is an official of the Government?—Yes. He says that this year the farmers were very pleased with the cotton. They had a severe drought, and the only crop they got was cotton.

5885. **(Mr. Garnett.)** Have the pests attacked your cotton or not?—Only a little. There is the ordinary aphis. There is nothing very bad about that.

5886. Are you capable of controlling these?—Yes.

5887. You have not got the boll weevil yet?—No.

5888. Is there a great expenditure on labour to keep the land clean, chopping, I think it is called?—No, chopping is simply taking out the plants which you do not want. Cotton is planted in a continuous row, and when it is about 9 or 10 days old you go through it and take out some of the plants, leaving only one plant about every 18 inches or 2 feet, and that is called chopping. I do not anticipate much difficulty in keeping it cleanly cultivated.

5889. I think in the States the days of the great plantations are gone?—I will not say they are gone yet. But the Government is giving the planters in the South now advice to plant less cotton, because they find that if cotton is looked after better and grown on a smaller basis, it will pay better per acre than a great plantation which is simply planted and then left.

5890. Take Texas, which now produces about one-third of the crop in the States, it is not grown there on big plantations?—No, it is grown on smaller farms as a part of mixed farming.

5891. And if cotton ceases to yield a sound return, the farmers put the land under wheat or maize?—Yes.

5892. They do not tie themselves down to cotton. Cotton has been the best thing, no doubt, for some time past, but there is nothing to prevent a man going in for some other crop if he finds it more profitable?—That is quite true.

5893. That is one of the advantages of cotton, that it does not tie a man down to one crop irrevocably?—That is so.

5894. Can you give me any prices of South African cotton?—I think it has fetched between 10*d.* and 1*s.* grown on the coast. That is middling, Upland being at 6½*d.* or 7*d.*

5895. It goes from 300 lbs. to 350 lbs. on middling?—I am not talking about Transvaal cotton. This is coast cotton.

5896. If you compare those prices with the prices in the period after the Civil War, they are about 150 per cent. higher, and, therefore, while it would not have been a sound proposition at 3*d.* in competition with American cotton, the present prices put an entirely different complexion on the matter?—Yes

5897. One cannot and does not expect the farmers of this or any other country to grow cotton unless it is economically the best proposition for them to take up?—Yes.

(Mr. Sinclair.) As this witness is making his first experiment, I would suggest, Mr. Chairman, that it would be helpful to us if he would write to the Commission in England and give the results of his first crop.*

5898. **(Chairman.)** Yes, I shall be glad if you will do that?—I shall be very pleased to do so.

5899. **(Sir Rider Haggard.)** For how many years have samples of cotton been turned out in the Cape?—That is a question I cannot answer, I do not know. They have lots of samples in Manchester, at the head-quarters of the British Cotton Growing Association, showing the very best kind of cotton that can be produced, except, of course, the Sea Island variety, which we do not expect to grow.

5900. During the period of years, how much has been sent from this country?—Only sample lots.

5901. Until now the industry has never taken any real root?—No.

5902. **(Mr. Campbell.)** I understand you expect to gather your harvest in about six weeks?—Yes.

5903. Does not that bring you dangerously near the rainy season?—No. We shall be getting towards the time when we get the least rain, in June and July. I have taken the rainy season on an average for ten years, and I find the average only about 1 to 2 inches in June and July, whereas we average nearly 3 inches for the other months of the year.

* *See* p. 329.

Major-General Sir Edward Yewd Brabant, K.C.B., C.M.G., called and examined.

(*For the evidence of this witness on "Land Settlement" and Animal and Agricultural Produce" see pp.* 26 *and* 209.)

The witness made the following statement:—

Recently, for some years I have been experimenting with cotton. I have shown that cotton can be grown of good quality, and that if it is properly looked after it will pay very well, but mine were only small experiments. I have given it up now, because Mr. Howe Browne is now working on a commercial scale, and I am getting on in years.

5904. **(Chairman.)** Mr. Garnett wanted to ask you a question: You were here in the early history of cotton?—Yes.

5905. Why was cotton given up if it was so suitable?—When we began there was no town here at all. There was only one small Kaffir shop here when I first settled. There was no one to buy the cotton, and you could not get it ginned, and then again the price fell. We began just after the Civil War in America. But what really put a stop to it was the discovery of the diamond fields. Everyone cleared off there.

5906. **(Sir Rider Haggard.)** You said in connexion with another subject that some of the farmers will not trouble. And you also heard what the previous witness, Mr. Howe Browne, said?—Yes.

5907. Does it not strike you that your statement as to failure to take trouble has a great bearing on the future of cotton-growing?—In what way?

5908. In that you will not be able to get cotton taken up very largely?—You must bear in mind that the small farmer, and there are many small farmers in this district now, will probably take to cotton-growing. I know they have all along been watching the experiments, and I think they will take to it.

5909. To make a living?—Well, to make a little ready cash.

TRANSVAAL.

Pretoria, Tuesday, 31st March 1914.

Mr. W. H. Scherffius, Chief of the Tobacco and Cotton Division of the Department of Agriculture, Union of South Africa, called and examined.

5910. **(Chairman.)** You have been good enough to write a memorandum on the subject of the cultivation of cotton in the Union of South Africa which we have read with interest. Are there any other points which you would like to bring out in addition to those mentioned, or would you like to answer questions?—

Probably if you were to ask me questions it would be the best way to bring out the things you most desire to know.

The following is the memorandum submitted by the witness :—

Cotton Notes.

The cause of cotton-production not meeting with success in the past is attributable to a number of causes :—

(*a*) Cotton was making some progress in the early days along the Eastern coast, till the Kimberley diamond fields were discovered, when everybody rushed for the diamond fields and cotton culture ceased, except in isolated cases.

(*b*) In the inland areas, for the past five or six years, consistent efforts have been made to arouse a new interest in cotton culture. The drawbacks to its progress have been lack of knowledge of how to deal with the crop, indisposition on the part of the farmers to thoroughly cultivate the cotton, high cost of implements, lack of ginning facilities, high cost of transport by wagon, rail and sea, lack of an industry to utilise the product and by-products locally.

Future Prospects.—There is by far a larger crop growing at present than has ever been attempted before. Something like 8,000 acres were planted to cotton this season, but, on account of the unprecedented drought, probably not more than 1,000 acres will come to maturity, but even this will be the largest crop yet produced. Farmers are showing a decided interest in cotton culture, and will continue now until they determine whether or not it is going to be a paying proposition. Excellent results have been obtained by farmers. Isolated cases can be given where farmers have produced 2,000 lbs. of seed cotton per acre.

Ginning facilities have been considerably improved in the last year or so, and the industry has received encouragement in other ways.

The prices for lint usually range between 6*d.* to 7½*d.* per pound. Occasionally, parcels run to 10½*d.* and 1*s.* per pound where the fibre is long, strong and silky.

5911. **(Mr. Garnett.)** You say there is a very much larger crop of cotton now than has ever been attempted before, some 8,000 acres planted, but only about 1,000 will come to maturity?—Yes.

5912. In what neighbourhood is this cotton?—Principally in the Rustenburg District.

5913. Is it within easy reach of Pretoria?—Within about 70 miles from here.

5914. Could you say anything about the method by which the land is prepared?—The land is rather indifferently cultivated, especially in this part of the country, and the farmers prepare their land for cotton very similar to the way they prepare it for mealies.

5915. To what depth do they plough?—We usually try to get them to plough 10 inches, but they generally fall short of that. I should say it is about 6 inches or 8 inches.

5916. Has it been necessary to fertilise the land?—Sometimes they use a little kraal manure, but they do not go in for artificial fertilisers.

5917. Now, these 1,000 acres that you speak of. Are they in a number of hands?—Yes, probably the largest single plot would be 100 or 200 acres.

5918. Then they are growing cotton as part of a system of mixed farming?—Yes. A great many of these farmers that are growing cotton this year were formerly tobacco growers in the Rustenburg District, which is the biggest tobacco-growing centre in South Africa, and the falling off in the price of tobacco in the last year or two has resulted in their looking for something else, so they are trying cotton-growing.

5919. They have put in cotton in place of tobacco?—Yes, partially.

5920. Now, is it in your knowledge what varieties they are growing?—Well, in this area that I am speaking about—the Rustenburg District—they go in mostly for American Upland varieties, they are growing probably half a dozen different kinds, such as Cleveland's Big Boll, Christopher, Herlong, and Toole; about half a dozen American Upland varieties altogether.

5921. And from that is it expected to produce a crop with a fairly long staple?—The staple is about 1 inch to 1⅛ inch in length.

5922. Not longer than that?—No. In some cases they may get longer, but as a general rule I think that would be the length. Then another variety that will come to the fore in this district is the variety called Nyassaland, which was originated in Nyassaland, and we have some of the seed. That gives a rather longer staple—1¼ inches to 1⅜ inches.

5923. The 1⅛-inch staple, as you know, brings you right into competition with the ordinary growth of American cotton?—Yes.

5924. And as at the moment you would grow only comparatively small quantities it would be difficult to obtain a mark or name for so usual a quality. I mean to say it is simply an ordinary quality. You cannot say as yet what the length of staple is that is going to develop out of these plots under cultivation at the present time?—Well, our best results so far have come from the American Upland varieties. We have also tried Sea Island and Egyptian varieties, but some of those varieties do not seem to do so well in these inland districts. They do better close to the coast, but even there I think the American Upland varieties are doing better.

5925. The price for this variety is from 6*d.* to 7½*d.* per lb.?—Yes.
